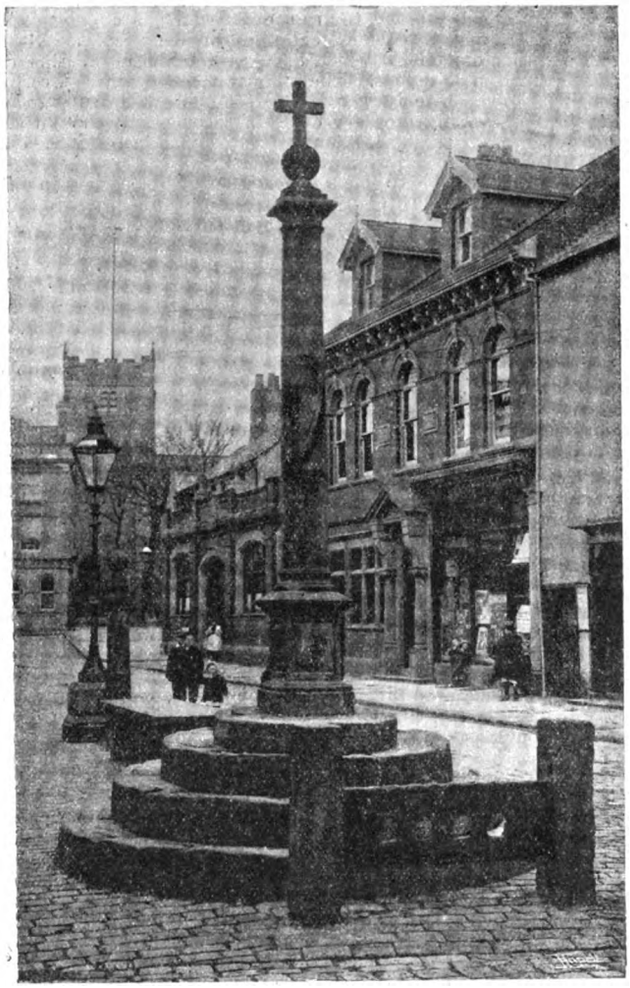
SELF-STARTING MOTORS.—In reply to "Viator" in the *Journal* of the 17th inst., the Bolton Automobile and Steam Wagon Works, All Saints' Street, Bolton, write:—"We some time back commenced making a self-starting switch for motors having non-trembler coils, which we believe will overcome "Viator's" difficulty; if he decides to go on with this switch, which, we may say, requires little or no alteration to the present arrangement of fittings on his car, we shall be pleased to correspond with him on the subject.



COLD WEATHER PRECAUTIONS.

NON-FREEZING CYLINDER COOLING LIQUIDS.

By Prof. JAMES L. HENSHAW.

THE problem of the care of motor-cars in winter looks a remarkably simple one at first sight, in the light of what has been done in cold storage work. Stated briefly, the problem is, first, to provide a liquid which can be kept in circulation, and can by so doing transfer the heat which is delivered to the engine cylinders from them to the atmospheric air, the liquid alternately receiving heat from the cylinders and delivering it to the air through the radiator. The problem is precisely similar to that which is dealt with in cold storage, where an evaporative condenser is used, and where brine coils are employed. As the temperature of the cold chamber must be at a temperature many degrees below freezing point, the liquid which is the agent employed to convey the heat from the chamber to the water, or the air which is the ultimate source of cold, must itself be so arranged that it will not freeze at the lowest temperature dealt with.

It would look as if all that was necessary was to provide the cylinders of an automobile engine with a cooling liquid that would not freeze,

The Ancient Stocks and Market Cross at Poulton-le-Fylde, Lancashire.

Photo by] [*R. W. Lord.*

and there the matter would end. But, unfortunately, the problem of cooling the engine of a motor-car is by no means so simple as that involved in cooling the air in a cold chamber by means of brine. In the cold chamber problem the brine circuit contains only one metal, usually, and though the temperature of the brine, and therefore of the pipes in which it circulates, is necessarily different at different points of the brine circuit, the difference is very trifling. The temperatures are all low. On the other hand, in the motor-car the cooling circuit often contains two or three metals, and the differences of temperature are very serious. In addition, the temperature at one part of the cooling circuit is very high, and everyone who has studied chemistry knows the effect of heat upon many salts. The salts we are familiar with in chemistry are held together by their chemical affinity, and this bond is very often ruptured by the agency of heat and of electricity.

In the cooling circuit of a motor-car the liquid is subject to the disruptive force of a high temperature, and of the equally disruptive force, in certain cases, of an electric pressure. Copper and iron, with a liquid between them, such as is used in cold storage work, for cooling purposes, form a galvanic battery, whose presence will lead to the gradual

Digitized by Google

eating away of the iron. Chloride of sodium and chloride of calcium are the two liquids employed for brine in cold storage work, and both of these are decomposed by electric currents, especially when aided by heat, liberating chlorine gas, which acts upon the iron. Chloride of sodium has been practically given up in cold storage work, on account of its greater liability to attack the metal of the pipes carrying it, and, as mentioned, there is not the difference of temperature nor the electric pressure present in cold storage.

Glycerine also has been used with success by some automobilists, but has the troublesome property that it is also decomposed at high temperatures, such as are met with at times on the outside of the engine cylinders. Grease has also a troublesome effect upon india-rubber, as those who have had much to do with it know, hence, though glycerine may answer in special cases, it is not reliable. There is still another troublesome quality possessed by some of the cooling agents employed. Evaporation is constantly going on from the cooling liquid, and in some cases, notably that of glycerine, some of the substance which is used to lower the freezing point of the water in which it is dissolved is carried off with the water vapour. This would hardly be the case with sodium and calcium-chlorides, as they have such a capacity for absorbing moisture. Calcium chloride, in fact, is used, in the latest arrangement of cold storage, to dry the air which is circulating in the cold chamber, and if calcium chloride can be used, notwithstanding the other objections which have been mentioned, this quality would be much in its favour. The complaint made with glycerine and liquids which evaporate is that the percentage of the substance upon which the non-freezing property depends becomes smaller and smaller, and the effect is gradually lost unless more of the substance is added, while it is not easy to tell when it is needed.

It is hardly possible to give a remedy that will be certain in all cases, but it is possible to indicate in what direction the remedy is to be found, so that those who have the time, and the needful, may be able to follow the matter up. Cooling or freezing mixtures depend for their cooling effect upon the fact—which has only recently been worked out by the new school of chemical-physicists—that when a solid is dissolved in a liquid, the process is equivalent to raising the solid to the liquid condition, and demands that the heat which would have been required for liquefying the solid in the ordinary way shall be delivered to the solid, just as it would be if it was being raised to the liquid condition by the direct application of heat.

As the solvent is the substance nearest to the solid that is in process of solution, the necessary heat is taken from it in the first place, and by it from the surrounding bodies, hence the cooling effect produced. But the effect of dissolving a solid in any liquid is also to lower the freezing point of the liquid. The process of the solution of any non-volatile substance in a liquid is closely connected with the osmotic or vapor pressure, and this again is so directly connected with the freezing point that the measurement of the freezing point of a solution is one method of determining the vapour pressure. It had perhaps better be explained what is meant by osmotic or vapour pressure. It is also called surface tension. As is well known, water and other liquids evaporate at all temperatures. That is to say, vapour is always coming away from the surface of any liquid except under special conditions. This vapour exerts a certain pressure upon the atmosphere, or whatever may be above it—a pressure which can be measured by suitable appliances, one of which is the ability to force its way through a porous division. The vapour pressure, or the tension upon the surface of the liquid, is lowered by the addition to the liquid, by solution, of a non-volatile solid, and in a definite proportion. And with the depression of the vapour tension of the liquid its freezing point is also lowered under similar conditions.

Hence the problem resolves itself into the comparatively simple, though probably tedious one of testing different substances, which, when added to water, will lower the vapour pressure and the freezing point, and selecting one which has not the properties mentioned above—that is to say, which does not, when operated upon by heat, evolve substances which will act prejudicially upon the cooling circuit, and that has little or no electro-chemical action under the conditions. It is one of those cases, so well known to the practical chemist, where every known substance of certain groups has to be tested for certain properties, the list being gradually brought lower and lower, the number of substances possible smaller and smaller, till a certain small number remain, all of which will probably be suitable under certain conditions, but some of which will be more suitable for certain conditions than for others. There will be a large number of substances which will fulfil some of the conditions, and a careful examination of their known properties will save much time. One thing must be borne in mind—the final test must be actual practice on a motor-car, under all conditions. There is a formula, which the writer gives for the benefit of those who have time to follow the matter up, which shows the number of degrees the freezing point should be lowered by the addition of a given quantity of any substance to water by solution. The formula is:

$$t = E \frac{m}{M^1}$$

Where t is the number of degrees the freezing point is lowered: m is the number of grammes of the dissolved substance; and M^1 is the molecular weight of the dissolved substance. E is calculated from another formula, as follows:

$$E = \frac{\cdot 02T^2 n}{W}$$

Where E is the difference in the freezing points of the solvent and a solution therein, the solution containing n gramme-molecules of the dissolved substance in 100 grammes of the solvent, T is the absolute temperature, and W is the latent heat of fusion of one gramme of the solvent.

The writer has found one substance which he believes will fulfil the conditions—caustic soda. It is not a very nice substance to handle, but as it would only have to be used in cold weather, and then only handled very little, he believes that it will be found to answer the purpose while other substances are being looked into. A ten per cent. solution of caustic soda, the writer calculates, will not freeze under the conditions usually met with. It also presents favourable conditions in the matter of galvanic and chemical action. One thing, however, must be mentioned—caustic soda must not be used where aluminium is employed.—*The Automobile Magazine.*

CLUBS AND ASSOCIATIONS.

LINCOLNSHIRE.

A MEETING of the committee of the Lincolnshire Automobile Club was held at the White Hart Hotel, Sleaford, on Wednesday of last week. The Chairman, Capt. J. A. Cole, J.P., presided, and there were also present:—Mr. C. W. Pennell, J.P. (Lincoln), Mr. W. R. Pennell (Lincoln), Dr. Gilpin (Bourne), Dr. Godfrey Lowe (Lincoln), Mr. George Godson (Asgarby), and Dr. E. H. Cragg (the club secretary). A draft of the new club rules was before the meeting, and these were ordered to be circulated amongst the members for approval and confirmation at the general annual meeting to be held in February.

Three new members were enrolled, viz., Earl Brownlow (Lord Lieutenant of Lincolnshire), the Rev. J. Herbert Heath (Folkingham), and Dr. Stitt-Thomson (Lincoln).

MOTOR-CAR FATALITY.—DRIVER EXONERATED.

DR. F. J. WALDO has concluded an inquiry at Southwark into the circumstances attending the death of Emma Simpson, who was crossing New Kent Road, when she was knocked down by a motor-car, driven by Joseph Waters, of the Mo-car Syndicate, Paisley, Scotland, and carrying three sergeants of the Army Medical Corps and the Army Service Corps. She was removed to Guy's Hospital, where she died from severe internal injuries. Two witnesses declared that the car was travelling at the rate of sixteen or eighteen miles an hour; but the occupants of the car put the pace at eight to ten miles. The chauffeur said that the woman stopped when he sounded the horn, but started again, and was knocked down. The effect of the collision and applying the three brakes was to turn the car completely round, which accounted for some witnesses saying it was on the wrong side of the road, and had been travelling in the opposite direction. To show his care and skill as a driver he produced a testimonial from Major-General Wingate, the Sirdar, who had asked his firm to allow him to accompany the General to the Soudan and take a specially-built car there. Waters had carried out some trials for the Sirdar on the sea-shore, to test the car's fitness for desert work. The jury returned a verdict of accidental death, and exonerated Waters from all blame.

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Kingston.....	Driving beyond legal limit	Dismissed.
Bow Street, London	Several cases of driving beyond regulation speed in Royal parks	40s., etc.
Lambeth	Using unregistered car	5s., etc.
Redditch	Unilluminated rear number	5s., etc.
Brentford	Several cases of furious driving.	Aggregate fines, £50.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 *and* 40, *Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JANUARY 7, 1905. [No. 305.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE development of the movement for technical instruction with regard to automobile matters in London Polytechnics is proceeding very satisfactorily, and early in the present month Mr. C. W. Higgs will commence a course of practical work at the Borough Polytechnic Institute, London, S.E. This course is intended for those who are connected with the industry as drivers and repairers, etc., and has the advantage of being conducted by a gentleman who is a practical motor engineer of experience in designing as well as driving. We could mention the case of another Institute in London where theoretical knowledge rather than practical acquaintance with the automobile industry has led to a slackening of interest among students, which augurs badly for the future classes at that particular place; but at the Borough Polytechnic, as at Battersea, practical work by a practical man should do much to establish on a permanent basis the success of the automobile department. Mr. Higgs proposes a lecture of an hour, to be followed by practical work; and as not more than twelve students will be permitted to take the latter at one time, it is evident that something like personal attention will be given. This should prove of material advantage to the students.

◆ ◆ ◆

Dorset's New Letters.

THE sensitiveness of the Dorsetshire motorists, who did not appreciate being labelled with the mystic letters B.F., has found its way to the Local Government Board, which has consented to an alteration. Of course those who prefer to retain the letters already obtained may continue to be thus distinguished among motorists; but doubtless many will prefer the new identification mark, F.X., which the Board has just sanctioned. Let us hope that Dorsetshire owners will now be happy, and go on their way without the inconvenience of police traps, and without the annoyance from small boys, who seem to have read strange meanings in the old symbols, which have official patronage no longer.

◆ ◆ ◆

An Appeal Allowed.

WHILE congratulating Mr. Louis Sinclair, M.P., on his successful appeal against the decision of petty justices, we would remark that his is no isolated case. The Recorder of Folkestone came to two conclusions:—First, that the evidence of the constable with regard to the speed of the motor-car was unreliable; second, that Mr. Sinclair did not appreciate the significance of the charge, and consequently did not tender legal evidence at the original hearing. Many convictions have been quietly acquiesced in by their victims where this latter view has been taken. Motorists in their novitiate have frequently been summoned, and, believing in the impartiality of British justice, have sent their drivers to defend the case, never dreaming of inconveniencing their friends who happened to be on the car by summoning them from distant places as witnesses. In practically every instance of that kind fines have followed, which, had the defendants realised the existing prejudice, might have been minimised by personal appearance. But we would remind the Recorder of Folkestone that, even had Mr. Sinclair thus appreciated the position, the difficulty of unreliable police evidence has to be encountered. Therein lies the crux of the matter so far as motorists are concerned.

◆ ◆ ◆

The English Entries for the Gordon Bennett Race.

ELSEWHERE we discuss the new conditions which have been introduced into this international contest. To the "man in the street," as distinguished from the man in the car, quite as interesting will be the news that the Eliminating Test for the British team, to be held in the Isle of Man, will be productive of a keen contest. There will be ten cars in the event. Mr. A. Rawlinson will drive a Darracq, and Mr. Lionel de Rothschild's Siddeley car will be driven by Mr. Sidney Girling, who will not on this occasion be found—as reported in a contemporary—at the wheel of a Wolseley. Two Star cars, two Wolseleys, and a quartette of Napier cars conclude the entries which were received up to Saturday—the last day. Messrs. John Hargreaves, Cecil Edge, Clifford Earp, and Arthur Macdonald will be the drivers of the latter.

◆ ◆ ◆

The Sussex Club.

AN Automobile Club is about to be formed for Sussex, and on the 28th instant a meeting for the purpose of inaugurating the organisation will be held at the Ship Hotel, Brighton, a rendezvous familiar to motorists. The news of the formation of this new club leads to a feeling of surprise that it was not thought of earlier, having regard to the prevalence of prejudice in that part of the county. Still, better late than never, and the motor-car meet which is being proposed for Brighton this year should give the Sussex Automobile Club an excellent opportunity of entering the automobile world with distinction.

◆ ◆ ◆

The Glidden Trophy.

TUESDAY, July 11th, has been fixed as the date for the start of the first contest for the Glidden Touring Trophy. The tour will take the place of the annual endurance run of the American Automobile Association. It will start from New York, and continue for two weeks over a course of one thousand miles. The route will be through Stamford, Bridgeport, New Haven, Hartford, Springfield, and Worcester to Boston. One day will be spent in a run of one hundred miles in the district round the latter city, the tourists afterwards proceeding to the White Mountains, and return to New York by way of Lowell, Worcester, Lenox, Albany, and Poughkeepsie. Two days will be spent in the White Mountains and one in the Berkshires. Each competing car will be credited with a given number of points at the beginning of the tour, and every stop.

Digitized by Google

en route for repairs will be penalised at the rate of one point for each minute lost. The contest is to be decided on stops for repairs and petrol consumption. Tyre repairs which require stops will not count against competitors. The car which makes the best combined showing of fewest points lost and least petrol consumed per ton-mile will be declared the winner of the trophy. The runs each day will average less than one hundred miles, and violators of speed laws will be disqualified.

◆ ◆ ◆

Motor 'Buses for London.

At length one of the two great London 'bus companies has definitely determined to take the plunge and commit itself to the development of motor traction in place of the horsed vehicle which has been in the streets of the metropolis so long. "The time has now come," they say, "when the operation of substituting mechanically-driven vehicles for the present horse cars should be seriously commenced." The Road Car Co. is favourably placed for undertaking the change contemplated, as with its established organisation the adoption of mechanical traction should be a matter of easy accomplishment, and the directors anticipate that it can be carried through without any disorganisation of the present traffic. The directors report that they have entered into contracts with two of the leading concerns for delivery to the company of a considerable number of suitable motors; and further that they have obtained options for the supply of additional motors as required; and have secured from the companies in question the exclusive right of supply for use in London during the execution of the company's orders.

The Orion Motor-Omnibus.

◆ ◆ ◆

The Utilisation of Ordinary 'Bus Bodies.

One problem the 'bus companies are concerned with is the disposal of their present rolling stock. This has been one of the stumbling blocks to the introduction of the motor vehicles. Hitherto manufacturers have built bodies to suit their own particular design of *chassis*, but now Messrs. Moss and Woodd, of Kensal Rise, have conceived the idea of building an Orion *chassis* which will admit of the present 'bus body being used almost in its entirety—everything, in fact, except the wheels. So far as smooth running and comfort is concerned the result is entirely satisfactory. The motor employed is a two-cylinder of the opposed type, and develops 20-h.p.; it is fitted with Eisemann high tension magneto ignition. There are four speeds and reverse. Sirdar tyres are fitted on all wheels. The weight of engine and *chassis* is 36 cwt., and it is claimed the vehicle can be run seven miles with full load up on a gallon of petrol. It will be interesting to watch the progress of the vehicle, which is put upon the road by the London General Omnibus Company, and is already to be seen on the streets of the Metropolis.

◆ ◆ ◆

The Railways and Motor 'Buses.

The Midland Railway Company, judging from a clause in their new Bill, have determined to develop their omnibus business, and utilise motor-vehicles in their chief centres. This departure is said to indicate an intention on their part to tap the rural districts, as feeders of their lines. But it also gives power to the company to use motor-'buses in competition with tramways. This latter reprisal can hardly be said to be altogether unexpected. It must be regarded as the official "tit for tat" for the havoc which the modern tramcar is making with some of the shorter runs on the rails. All the great railway companies are beginning to recognise that if their revenues are to be maintained against the competition of the tram they will have to bring the motor-vehicle to their aid—not only as a feeder to their lines, but also as a means of carrying passengers to their destinations.

◆ ◆ ◆

The Motor Union and the Provinces.

The principle of holding some of the meetings of the general committee of the Motor Union in provincial centres like Manchester, Birmingham, Nottingham, and Leeds has been approved of by that body, and something definite will be reported next month. This organisation has a large membership beyond London, and the proposed innovation should have a good effect in stimulating provincial interest in the doings of the national organisation. London members of the committee, too, will have better opportunities of realising the enthusiasm with which the country clubs carry on their work, and doubtless the periodical visits of the Motor Union to provincial towns will be made the occasion for county reunions of interest and value to the movement.

◆ ◆ ◆

Dangers in Garages.

The recent fire at a motor garage in Brooklyn, U.S.A., has resulted in a spurt of activity on the part of the Bureau of Combustibles of the New York Fire Department, which has just issued a notice to the effect that "garage owners must hereafter obey the law—the spirit of the law as well as the letter. The regulations regarding the storage and sale of gasolene, which the automobile dealers themselves helped to frame, will be strictly enforced from now on." The Superintendent of the Bureau is also credited with the statement that "in future all heat, or steam used for heating, must come from outside the building, the use of stoves or furnaces being absolutely prohibited. No licence for the storage of gasolene will hereafter be granted where the 'day population of the building above the garage is one hundred people or more.' In cases where a licence has been granted, and it is found that such conditions exist, the licence will be revoked." At the garage of the Michelin Tyre Company, in New York, recently, it was found that 250 people were employed on the several floors above, and its petrol storage licence has consequently been revoked. The regulations for the storage of petrol, which will now be enforced to the letter, require that "in automobile storage stations the storage of naphtha (petrol) shall be by one of the following methods only:—(a) In an iron or steel tank of approved design and construction, buried underground, with the top at least two feet beneath the surface; the maximum amount stored therein not to exceed 275 gallons; not more than one tank shall be permitted upon the same premises. (b) In approved sealed metal cans, to a maximum amount not exceeding 50 gallons." Sand must be kept in buckets fit and available for absorbing

Digitized by Google

waste oil that might fall upon the floor. The use of sawdust for this purpose is strictly prohibited. No naphtha shall be put into or taken out of an automobile within 50 feet of an open fire, nor until lamps or other apparatus intended to be carried upon the vehicle for illuminating purposes or as pilot lights have been extinguished. Buildings of this character must be lighted only by enclosed electric lamps.

◆ ◆ ◆

A 5,000 Mile Trial.

On Monday another long distance trial, under the auspices of the A.C.G.B.I., was commenced, a 12-h.p. two-cylinder Siddeley car being started on a pilgrimage of 5,000 miles. Mr. Sidney Girling, who drove a Wolseley car in last year's Gordon Bennett race, was at the wheel, and he will drive alternate days. Mr. A. E. Sutcliffe being the driver on the intervening occasions. It is the intention to make a daily trip of about 180 miles—Sundays excepted—so that the trial will extend into four weeks, thus giving the vehicle ample opportunity to prove its merits under varying climatic conditions. The month of January is not an ideal one for touring, and Mr. J. D. Siddeley's enterprise in thus putting his car to the test at a bad time of the year proves his belief in the reliability of the vehicle he has designed.

◆ ◆ ◆

The Siddeley Car.

Our readers are familiar with the main points of the car, to which full reference has previously been made in the *Journal*. It is of British construction, having been made at Crayford, Kent, and a similar automobile of 6-h.p. obtained a gold medal in the Reliability Trials at Hereford in September. The routes have been selected by the Club, and will be chiefly those which were covered in the recent 4,000 Miles Trial, including the Oxford Road, the Coventry Road, the Great North Road, the Bath Road, and other main highways. On Saturday, when the car was weighed in at the Club garage, an outburst of fine weather was cheering to the drivers, but when Monday morning arrived snow set in, followed by a drizzling rain, which made the roads greasy and dangerous. The trip was to North Leach and back, on the Oxford Road. On Tuesday the car journeyed to Coventry and back to London. At the time of going to press the automobile was still running well. Continental tyres have been adopted.

◆ ◆ ◆

Delhi to Bombay.

To those natives who have been prone to regard the motor-car as a mechanical means of murder on the high roads, the peaceful character of the reliability trials from Delhi to Bombay must have come as a revelation. A run of 1,000 miles was carried out in stages, and not a single mishap occurred to man or car. Tyre troubles, however, were frequent and worrying, and it is evident that the tyre manufacturers have a difficult problem to face in the Dependency, for nails from bullocks' shoes are familiar and frequent on the Indian roads. In the trial the small cars did well, a 6-h.p. Wolseley and a 12-h.p. Darracq covering the whole course without unauthorised stoppages and finishing without losing a single mark. A telegraphic advice says the Wolseley car was awarded the consolation prize offered by "The Times of India." The Gaekwar's Cup for the most reliable car was awarded to a De Dietrich car, and the Maharaja of Gwalior's Cup for the most economical machine to a Speedwell. The Maharaja of Mysore's trophy for the car finishing in the best condition, and the Raja of Kapurthala's Cup for the car doing the best district work, were both won by De Dion cars. The Nawab of Rampur's trophy for the absence of noise and vibration and ease in manipulation was awarded to a Fiat car, and Mr. Jeremiah

The Meet of the Automobile Club of Victoria at The Hermitage, near Melbourne, in November last.

Lyon's Cup for the most reliable car costing under £500 to a Darracq.

◆ ◆ ◆

Petrol in India.

Mr. J. F. Spring, of Madras, whose recent article in the *Journal* on Motor-Cars in India has attracted much attention in the British automobile industry, has been responsible for a representative gathering of motorists at the residence of Mr. Justice Boddam, at Madras. Most of those present drove in their motor vehicles, and no fewer than thirteen cars and four motor-cycles were counted. In opening the proceedings, Mr. Spring said that the present was a critical time in the history of Indian motoring, because a few weeks ago the Government published a set of draft rules under the Petroleum Act, some of which went too far. The proposed rule that petrol should be stored and transported in two-gallon steel drums would put all motorists to extreme inconvenience; for the petrol which went to Madras from Assam arrived in ten-gallon steel drums, while that which arrived from America, under the name of gasolene, was packed in eight-gallon steel drums. The latter drums were securely nailed up in strong pine cases, three-quarters of an inch thick, marked as having passed the test for transport of the New York Marine Insurance Union, for carriage below deck. Nobody could possibly desire stronger or better packing-cases, and yet, under the new rules, consumers would be compelled to carry out the risky operation of decanting their petrol out of these drums into new two-gallon drums, which he did not believe existed in Madras, even if they could be made there on a commercial scale.

Mr. J. A. Koosen's Motor Stud—an 1896 6-h.p. Lutzmann, which has covered over 100,000 miles, and a modern car of 9-h.p.

Indian Motor Union.

As regards a Motor Union, Mr. Spring thought that, for those first joining, an annual subscription of Rs. 10 for those owning a car or a motor-cycle, and Rs. 5 for those interested, but not themselves motorists, ought to serve; and that it would be time enough to talk of larger subscriptions when the Union had taken formal shape and attained respectable dimensions. Madras motorists were not the first in that part of the world to take action for their mutual protection and interest, for about 90 gentlemen had agreed to form an Automobile Club of Ceylon. The idea of a South Indian Motor Union was first suggested to him by Captain Sturrock, R.A., the Hon. Secretary of the recently formed Nilgiri Automobile Association. On the motion of Colonel Formby, it was unanimously agreed that Mr. Spring should be elected chairman of the new South Indian Motor Union, which was thus formed under very favourable auspices.

Official Haste.

Some idea of the absurd ways of those in official places was obtainable the other day at the South-West London Police Court, when Mr. G. D. Stevens was summoned by the Excise authorities for keeping a tri-car without a licence. Mr. Stevens is a recent accession to the ranks of motorists, and having registered his vehicle with the London County Council, thought that he had complied with all the official requirements. When he discovered that a licence had also to be obtained, he sent a cheque in payment. It was returned, with the intimation that payment must be made in cash. Within twenty minutes the money was forthcoming, but the Excise authorities had taken out a summons—a piece of haste that did not favourably impress the magistrate, who thought justice would be met by the defendant paying the costs only. Really, the ways of some public officials are entirely outside the pale of common sense, as the directions as to making the declaration expressly provide for payment by cheque.

◆ ◆ ◆

The Outlook in Scotland.

The article by the general secretary of the Scottish Automobile Club, which we publish in another column, will be read with interest by motorists on both sides of the Tweed. Speaking generally, Mr. Smith's impressions are corroborated by his confreres of the Yorkshire and Sheffield clubs. Down south motorists are not so satisfied as are those of the north, and it is evident that a spirit of wise toleration has been prevalent in Scotland, although it has been occasionally darkened by outbursts of ignorance on the part of Councils remote from the centres of automobile education. Mr. Smith would not be surprised to see the Motor Car Act relegated to the Expiring Laws Continuation Bill; but we should prefer to see some substantial amendments introduced to limit the exercise of the authority of the police, and to require more explicit evidence than they have been in the habit of producing.

◆ ◆ ◆

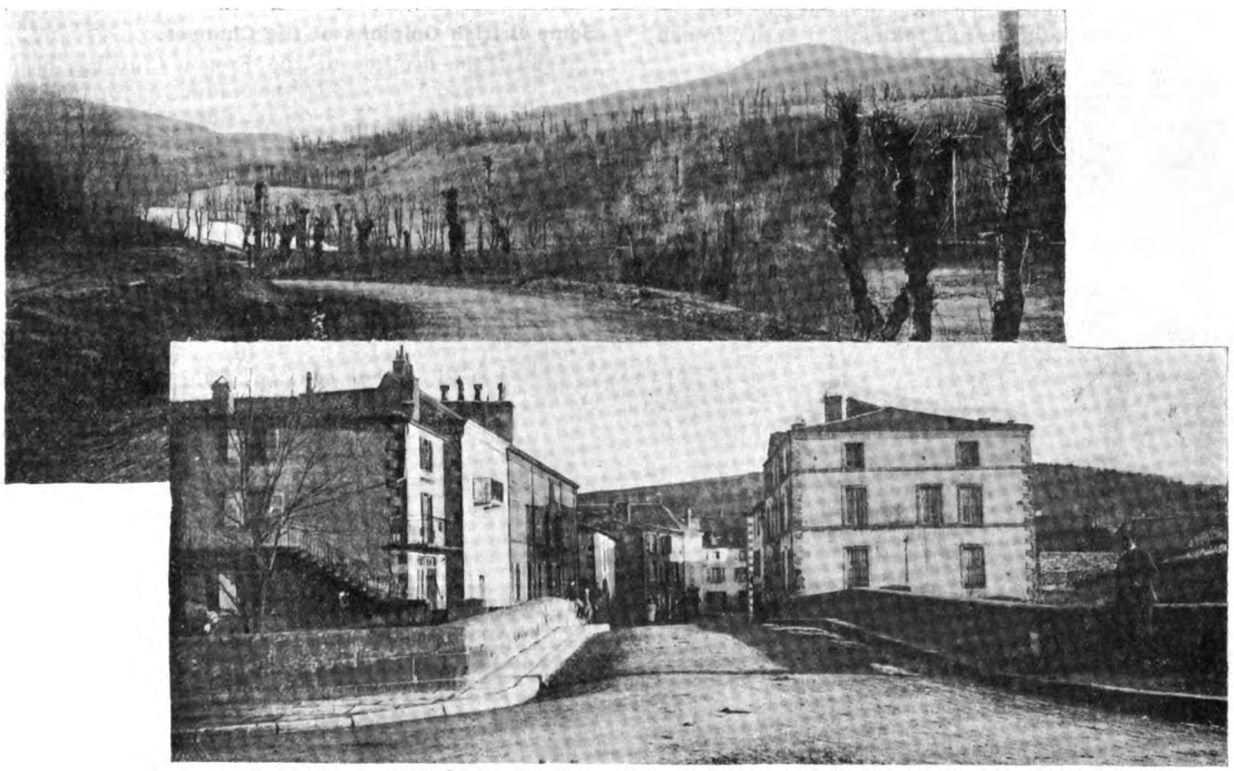
Inquiry at Leeds.

A notice has been given in the "London Gazette" that Mr. Edmund P. Burt, the Local Government Board Inspector, will hold an inquiry at the Town Hall, Leeds, on Wednesday next, into the application of the Leeds City Council to the Local Government Board for a regulation under the Motor Car Act, 1903, to constitute an area comprised within a two-mile radius circle from the junction of Briggate with Commercial Street and Kirkgate as a place within which motor-cars shall not be driven at a speed exceeding ten miles an hour.

◆ ◆ ◆

The Heavy Motor-Car Order, 1904.

After waiting a year for the issue of the Regulations of the Local Government Board with respect to heavy motor-vehicles, the industry will be glad to know that the official rules may now be obtained. The explanatory article on another page will sufficiently indicate the general purport of the new regulations, and show that, on the whole, the amended rules will not prove to the disadvantage of the industry. The Order prescribing the new regulations is termed the Heavy Motor Car Order, 1904, and, with the exemplification as to widths of tyres, is obtainable either directly or through any bookseller from Messrs. Wyman and Sons, Ltd.



As intimated in last week's *Journal*, the offices of Messrs. Cordingley and Co. are being removed to 27-33, Charing Cross Road, London, W.C., to which address all communications should be sent in future.

Digitized by Google

The 1905 Gordon Bennett Race.

DRASTIC CHANGES BY THE FRENCH CLUB.

THE great event of the past week has been the meeting of the committee of the French Automobile Club to decide as to the course over which the 1905 Gordon Bennett race shall be held. As will be seen, the selection of the course formed but a minor portion of the day's deliberations, as a result of which some very drastic changes have been decided upon. In the first place, it was resolved that the 1905 race is the last one in which the French Club will compete for the Gordon Bennett cup under the present conditions; it was, secondly, decided that combined with this year's event will be a race for the Grand Prix de l'Automobile Club de France, in which any number of cars may be entered by the different countries, so that each competitor may have an equal chance, and that in 1906 and subsequent years the A.C.F. will organise an annual international race for the Grand Prix.

A Nasty Turn near Bordas. The Entrance to Pontgibaud.

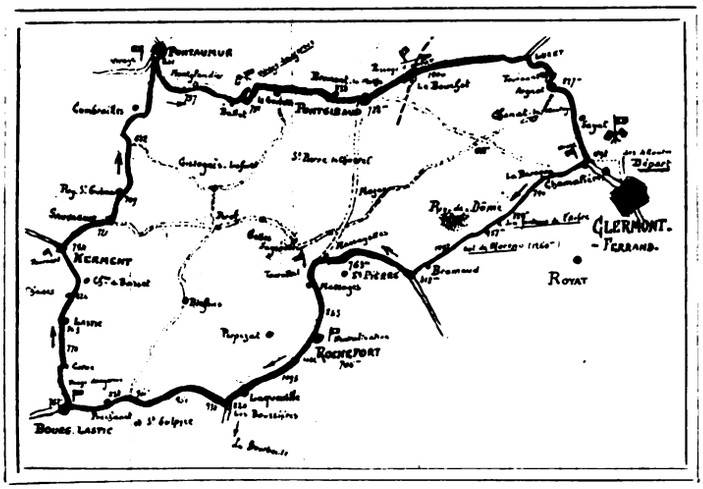
VIEWS ON THE AUVERGNE CIRCUIT.

The Selected Course.

Of the five circuits proposed, it was at first believed that the Aix-les-Bains district would be chosen, the municipality of that town having offered the organisers of the race a subsidy of £12,000. After some discussion, however, the Circuit de l'Auvergne, proposed by M. Michelin, was adopted both for the French eliminating contest and for the Gordon Bennett race. The course measures 134 kilometres (84 miles), and will therefore have to be covered approximately no less than five times. It starts at a point known as Les Quatres Routes, at the foot of the Puy de Dome mountain, 4,800 feet high, near the town of Clermont-Ferrand, where the Michelin tyre factory is situated, and runs west over the Moreno Pass to Rochefort and Bourg-Lastre, then north to Lastic, Herment and Pontaumur, west to Pontgibaud and back to the starting point. All accounts tend to show that the course is one of the most difficult so far selected for the great race. After leaving the starting point the road is of good width, but comprises many stiff climbs and equally rapid descents. The way out of Rochefort is difficult, while the entry into Laqueuille is described as "terrible"—a nasty right angle turn with a precipice of several hundred feet on each side. From Bourg-Lastic to Herment good time can be made, while the section between Pontaumur and Pontgibaud is of a switchback character. The only real advantage claimed for the circuit is that it is in a district in which there is little traffic, so that few neutralisations will be necessary—probably only two, at Rochefort and Pontgibaud, besides three level crossings.

We append a table showing the distance between the principal places on the circuit:—

	Kilometres.
Quatres Routes to Rochefort	28·5
Rochefort to Laqueuille	9
Laqueuille to Bourg-Lastic	14·5
Bourg-Lastic to Herment	15
Herment to Pontaumur	18
Pontaumur to Pontgibaud	21
Pontgibaud to Volvic	13·5
Volvic to Quatres Routes	14·5
	134



It is exceedingly probable that the 1905 race will not be a fast one in point of miles per hour, for the drivers will have to proceed with great caution, as frequent speed changing, application of the brakes, and clutch withdrawal will be necessary. It is stated that the municipal authorities of Clermont-Ferrand have offered to guarantee a sum of £8,000 towards the expenses of the race.

Digitized by Google

The town has between 50,000 and 60,000 inhabitants, and is about 240 miles from Paris. It lies in the centre of an interesting district, and already extensive preparations are in hand for the great influx of visitors which may be expected on the occasion of the great races. Within convenient distance, too, are the well-known inland watering places of Royat, Chatelguyon, and Vichy, the latter being about 40 miles from Clermont, and it is anticipated that many will make the hotels at one or other of the latter places their head-quarters.

The French Eliminating Trials.

The regulations regarding the eliminating trials for the French team for the Gordon Bennett race, which will take place over the Circuit d'Auvergne about a month before the great event, comprise several new features. Among these may be mentioned (1) that the engines and transmission mechanism of the cars must be constructed by the firms entering the vehicles; (2) that where different firms are making the same engine or mechanism under licence, an aggregate of three cars only of the one type will be admitted; (3) the entrance fee has been increased to £400 per vehicle; (4) in future any driver who may drive a car in a foreign eliminating contest or a foreign car in the Cup race itself will be disqualified from taking part in the French

Route Map of the Auvergne Circuit.

eliminating contest. As last year, the three fastest cars and their drivers in the eliminating trial will be selected for the French team for the Cup race; it being also provided that the cars must be fitted with the same make of tyres as in the eliminating contest.

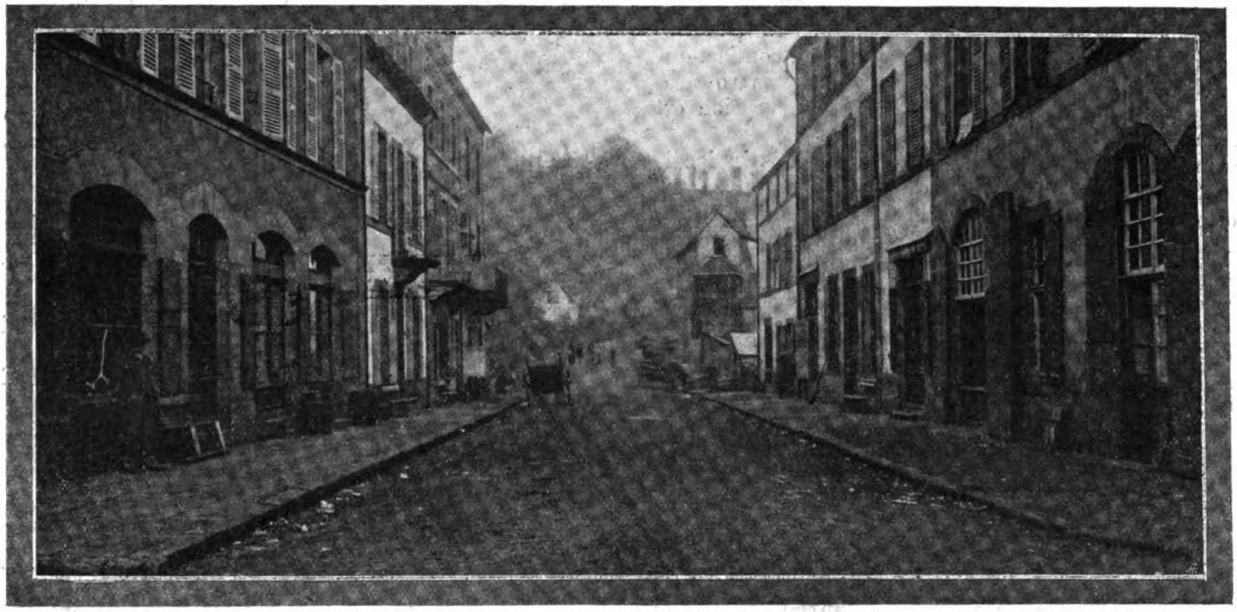
The Joint Race.

The decision to hold an open race for the A.C.F. Grand Prix in conjunction with the Gordon Bennett is practically due to a movement among the principal French manufacturers, who consider that it is unfair that France, which has the largest number of important firms, should be represented in the Gordon Bennett contest by only three cars, while such countries as Switzerland, Belgium, and Austria, which have, perhaps, only one really large firm each, should be allowed to send an equal number of vehicles. The joint race, for which prizes aggregating £8,000 will probably be offered, the "Auto" having headed the list with a sum of £4,000, is a return to the conditions which prevailed prior to the memorable contest in Ireland, the early Gordon Bennetts having always been held in conjunction with a long-distance race, such as the Paris-Vienna, Paris-Bordeaux and Paris-Berlin. We cannot say, however, that we are enamoured with the idea of a return to the old conditions, for there will be the great difference that this year's event will be over a circuit and not between widely-separated points as those above named. Should a large number of entries be sent in for the event—and it is quite possible that as many as seventy competitors will present themselves—the idea of all these cars tearing round an eighty-mile circuit, admittedly a most difficult one, is anything but pleasant to contemplate; for when it is remembered that the circuit has to be made five times by each competitor, it is easy to see that a good deal of passing will have to be done, while in many places the cars will become bunched together, seriously hampering the Gordon Bennett competitors. Although M. Brasier, of the Richard-Brasier firm, bowed to the inevitable, and voted with the majority at the A.C.F. meeting, he evidently views the outlook with alarm; for, after making a trip over the selected circuit, he is credited with the remark that "I am afraid to think that racing-cars will be despatched over such a dangerous course." The idea of a joint race is likely to meet with objection on the part of some of the clubs challenging the A.C.F. for the Gordon Bennett Cup. Already M. Hautvast, on behalf of the Pipe Company, which last year competed for Belgium, has announced that if the decision to run a joint race is persisted in no Pipe cars will this year compete for the Cup. Finally, it may be mentioned that there still remains the question whether the French Government, which is apparently willing to permit the Cup race, will give its permission for an open contest.

Some British Opinions of the Changes.

That the decision of the French Club has been received with very mixed feelings by the leading motorists in this country goes without saying. Mr. S. F. Edge, whom we saw on Tuesday, is most emphatic in protesting against the action of the A.C.F. in deciding on a joint race. While not forgetting that formerly the Gordon Bennett was run in connection with longer and probably more important events—for it was in the Paris-Vienna race that he won the much-coveted Cup in 1902—Mr. Edge looks upon the Cup race as a sporting event, which in recent years has assumed too important a character to be run in conjunction with another race organised purely in the interests of French builders. He himself is perfectly willing to compete under the present rules, where the best cars in the eliminating contest are selected for the Cup race. This procedure, which he considers fair to all, is not viewed with equal complacency by French firms, who, now that they find their supremacy in the art of automobile construction attacked by makers in other countries, who have equal chances with them in the Cup race, are seeking to upset this equality to their own advantage by instituting a race in which the French competitors will far outnumber those of other countries, so increasing France's chance of retaining the Grand Prix. Mr. Edge has no objection to the latter as a separate event, and if run on these lines would probably compete in it. He has, as a competitor in the English eliminating trials, however, sent in a strong protest to the A.C.G.B.I. against the proposed joint race. As to the Auvergne course, on which the contests are to be held, notwithstanding that this is credited with being the most difficult so far selected, Mr. Edge has no complaint to make with regard to the decision of the French Club. "However bad it is, it will be the same for all," he remarked, but added that the running of a joint race, and the consequent large number of competing cars on the circuit at one time, would be fraught with considerable danger.

Mr. Chas. Jarrott, strangely enough, views the matter in another light. In the first place, we may say that he has decided not to drive a car in the 1905 Gordon Bennett race. Speaking, however, as a competitor in former years, he cannot see that the decision of the A.C.F. to hold a joint race will inflict any injustice on foreign competitors in the Gordon Bennett event, for he points out that the French Cup team will be equally handicapped by the other cars on the road. From the French point of view the Grand Prix race is an excellent idea, and one with which Mr. Jarrott is not inclined to quarrel. He regards France as the home of automobile racing, and considers it not unnatural the A.C.F. should endeavour to make the event of the year the one controlled by themselves. He even goes further in maintaining that, inasmuch as it is due to the initiative of France-



Digitized by Google

that racing has been permitted in other countries, every encouragement should be given to the A.C.F. to encourage racing by permitting them to organise the annual great event. He looks upon the idea as tending to increase sport—and we all know that Mr. Jarrott is nothing if not a sportsman—for he believes that more competitors are likely to come forward when they are assured that in return for their entry fee they will have a chance of competing in an international event. Although the Auvergne course is admittedly a difficult one, Mr. Jarrott does not consider it will present any excessive danger to competitors by reason of there being a large number of cars on the road at one time. His ground for this opinion is based on the fact that, commencing with the Gordon Bennett in Ireland in 1903, a great change has been effected in circuit racing. Prior to that date the principal danger was found in the dust, which, particularly in the Circuit des Ardennes of 1902, hung over the course like a fog, rendering it exceedingly difficult for one competitor to see another in front of him. The use of dust-laying preparations has now removed this great drawback; to this may be added the greater reliability of the cars now built, so that altogether, even with 60 or 70 cars on the circuit at a time, Mr. Jarrott considers that the risks attendant on racing are at the present much less than at any former period in the history of the sport.

Mr. J. D. Siddeley, who is building a Gordon Bennett racer for Mr. Lionel de Rothschild, is as emphatic as Mr. Edge in his condemnation of the A.C.F.'s action, which he regards as altogether unfair, if not improper. He considers that the decision to run the Gordon Bennett in conjunction with another race can only be classed as an attempt to belittle its importance in the interests of French manufacturers, who apparently view with alarm the rapid progress which is being made by motor-car constructors in other countries, and the consequent reduction of their chances to retain the Gordon Bennett Cup. During the past few years the latter has developed into the great international sporting event of the motoring world, a position it will retain, in Mr. Siddeley's opinion, notwithstanding the inauguration of the Grand Prix de l'Automobile Club de France. Mr. Siddeley has no voice in the matter as to whether the car he is building for Mr. L. de Rothschild will take part in the Cup race under the new conditions, but considers it more than probable the A.C.G.B.I. will take some action in the matter. As to the danger due to the large number of cars which may be expected to be racing on the circuit at the same time, if the decision to run a joint race is persisted in, Mr. Siddeley expresses the opinion that the risks will be exceedingly great, more especially from the point of view of the incapacity of many of the drivers who will be entrusted with powerful racers, the number of men really qualified to handle fast cars being relatively few.

Our Own View.

Our own view is distinctly that the Gordon Bennett contest has now attained such international importance that a separate race is a *sine qua non*. In the early days, when France had to meet but one or two opponents, it was quite feasible to run the event in conjunction with another. The automobile movement is, however, a rapidly progressing one; and now that there are seven countries in a position to challenge France for the possession of the Cup, the Gordon Bennett has become a race between nations each of which has the right to be represented by three cars, and an equal right to a fair field. Whatever the Grand Prix may develop into, the chances of success therein will for many years be in favour of France, which, in the present state of the industry, is in a position to put fully twice as many cars into the contest as those of all other countries combined, and if the A.C.F. persists in running a combined Grand Prix and Gordon Bennett, we cannot see how the competitors in the latter can possibly meet on an equal footing. We have no objection to the Grand Prix whatever as a separate race, for those British or other foreign firms who enter for it will do so with a full knowledge of the fact that it will be a national event organised by the French Club. The Gordon Bennett is an international race, controlled by an international committee, and looked upon as *the* event of the motoring year, a position which we do not think it is likely to lose by any threatened abstention of France. At the present moment the eyes of the British motoring world are on the A.C.G.B.I., the action of whose committee in the matter is awaited with more than usual interest.

The Auvergne Circuit.—The Way out of Rochefort.

If the commutator on a car be on the dashboard, worked by a chain from the half-time shaft, be careful to either mark a link of the chain on a corresponding tooth of the chain wheel (*both* wheels must, of course, be marked), or have some disinguishing mark, so that the firing can easily be set if the chain comes off. On a dark night it is not a particularly easy task to set the firing of a four-cylinder engine.

THE ACT IN SCOTLAND.

By Robert J. Smith.

THE experience of the first year of the Motor Car Act, 1903, in Scotland has been, on the whole, satisfactory. The fears which were freely expressed after it had passed the Commons that the progress of the automobile movement would be stopped and the industry killed have been proved groundless. Both have given evidence of unbroken advance, and the year 1904 has, I think, seen more progress than any that has preceded it. The outcry against identification marks rapidly died out, and they are now treated as a matter of course. I have never heard of an instance of a car being given up or of a person refraining from purchase from this consideration. I believe they have formed in their progressive rotation a telling object-lesson to the general public on the progress of automobilism in the various districts.

The apparently anomalous licensing clauses will be found to have wrought satisfactorily. There can be no doubt that aversion to endorsation is common to every driver, and that this has tended to a stricter observance of the law, and, combined with the stringent provisions of Section I., has operated towards careful and considerate driving. In Scotland prosecutions of motorists have been comparatively few, and I would venture the opinion that this is as much due to good conduct on the part of the motorists and their drivers as it is to the generally friendly attitude and the reasonable conception of their duties and powers on the part of the police.

During the first year of the Act ten applications by local authorities in Scotland for prohibition of roads and restriction of speeds to ten miles per hour have been announced by the Secretary for Scotland. At the moment of writing three or four roads, only one of which is of any importance, but is not a through road, have been closed, and on three or four limited stretches in populous areas restrictions have been imposed. The Secretary for Scotland has initiated a general principle which he proposes to apply to all county applications, viz., that a speed limit of ten miles per hour should be imposed on main roads running through populous places where the circumstances call for such limitation, and he has been careful to make it clear that the circumstances in each and every case must be taken into consideration. Whatever view automobilists may take on this question they must recognise that the general public will be hard to convince that there is any hardship in a restriction in populous places to ten miles per hour or that that limit should be exceeded, and we cannot get away from the consideration that the general public is an important factor in the matter. Bearing in mind that there are thirty-three counties in Scotland and some hundreds of burghs, all of which are "local authorities" in matters relating to speed limits, the number who have moved in the matter is relatively very small. The question has been considered by some other authorities, some of whom, in deference to local representations, have agreed to take no action in the matter, while it is believed that some have been dismissed by the Secretary for Scotland without calling for objections.

The experience of the Act has doubtless revealed a number of weaknesses which were to be expected of such hasty legislation, and which, without involving any important questions of principle or controversy, can be easily remedied in any succeeding statute.

With regard to the outlook everything points to still greater progress in 1905. Leading manufacturers are sold far ahead and are more heavily booked than at the corresponding period in any previous year. There can be no doubt that the use of the motor-car is daily becoming more general and that the more recent cars are being used for town work and are supplanting the horse carriage to a much larger extent than did the earlier vehicles. In addition to this, the commercial vehicle is beginning to come in, and the prospects in that direction are decidedly encouraging. The progress which the automobile movement has made in the past will be nothing to the advance in store for it when the day of mechanical traction for commercial purposes arrives. One feature in this connection occurs to me. The proportion of owners of cars to-day who drive their own vehicle, or who even understand their vehicle, is becoming gradually smaller and the influence of the professional consequently greater, and the greatest care will require to be exercised to insure that this increase of influence does not become disadvantageous to the movement.

By the end of 1905 the Motor Car Act will have but one further year to run, and the question of its renewal or replacement by another Act will call for immediate consideration at the hands of the Legislature. Every indication furthers the belief that no important change will take place after the expiry of the present Act, and it would not be surprising if it is included in the Expiring Laws Continuation Bill. On the other hand, it is not unlikely that a replacement Bill may be introduced, remedying some of the minor weaknesses of the present Act, but continuing the law in its principal features. The question of identification and registration is, to my mind, settled for a lengthy period. I do not think there is the remotest prospect of an early abolition of a speed limit, but by careful and judicious negotiation it might be possible to replace the twenty-mile limit by a larger one, and to introduce a greater latitude with regard to restricted rates of speed which may be imposed by the governing authorities. Bearing all this in mind, the responsibility lying upon every driver of a motor vehicle cannot be too strongly enforced. They have the making or marring of the legislative prospect, and it is incumbent that cars should be so used on the highways, not only that hostility and prejudice on the part of the public may be avoided, and that these feelings in so far as they exist may be conciliated, but that the good feeling and support of the public at large may be engendered and encouraged towards the automobile movement. I have the hope that the attitude of the public towards automobilists and that of automobilists towards the public are running on converging lines, which will ultimately and not far distantly meet.

In Scotland the matter of limits has not been a pressing one. The authorities have largely proceeded on the view that the speed limit clauses should be considered preventive and suggestive rather than penal, and that the true test of offence is contained in Section I. We have no police traps in Scotland, and we hope, by the kind assistance of our friends from the south, to maintain this position.

It is not unlikely that before the present Act expires a general election will take place. We cannot have in any other or any different Government more intelligent or more friendly automobilists than are in the present one, but I do not know that that is a great consideration. In our experience legislators outside of the movement have been as valuable to it and have taken quite as broad a view of the situation as those within. I feel convinced that a general election will help the prospects of legislation, inasmuch as it will demonstrate to members of Parliament and to parliamentary candidates the valuable services of the motor vehicle. Few bye-elections have taken place recently where the motor-car has not been an important agent to the candidate throughout the contest and on the polling day; and if the same use is made of the motor-car at a general election as has been made in these instances, every candidate returned to Parliament will hold his seat indebted, more or less, to the cars of his supporters. I hope that car owners will make certain that this indebtedness is as assured and complete as possible.

Agents are about to be appointed for the sale in Great Britain of the "Maxwell" car, in connection with which Mr. J. C. Kirkham will be glad to meet members of the trade at the Hotel Cecil, London.

CONTINENTAL NOTES.

More Trials in France.

At a meeting of the Technical Committee of the French Automobile Club last week it was decided to organise during the present year at the A.C.F. laboratory a competition of different systems of ignition, one for transmission mechanism and one for silencers.

◆ ◆ ◆

Edison Accumulators in Germany.

An Edison Accumulator Company has been formed in Berlin, with a capital of £100,000, to manufacture the new Edison accumulator. Herr S. Bergmann, of the Bergmann's Elektrizitatswerke, will manage the new concern, which has rented the works of the Garvin Maschinenfabrik Gesellschaft. The production will commence early in the new year.

◆ ◆ ◆

Public Services in Germany.

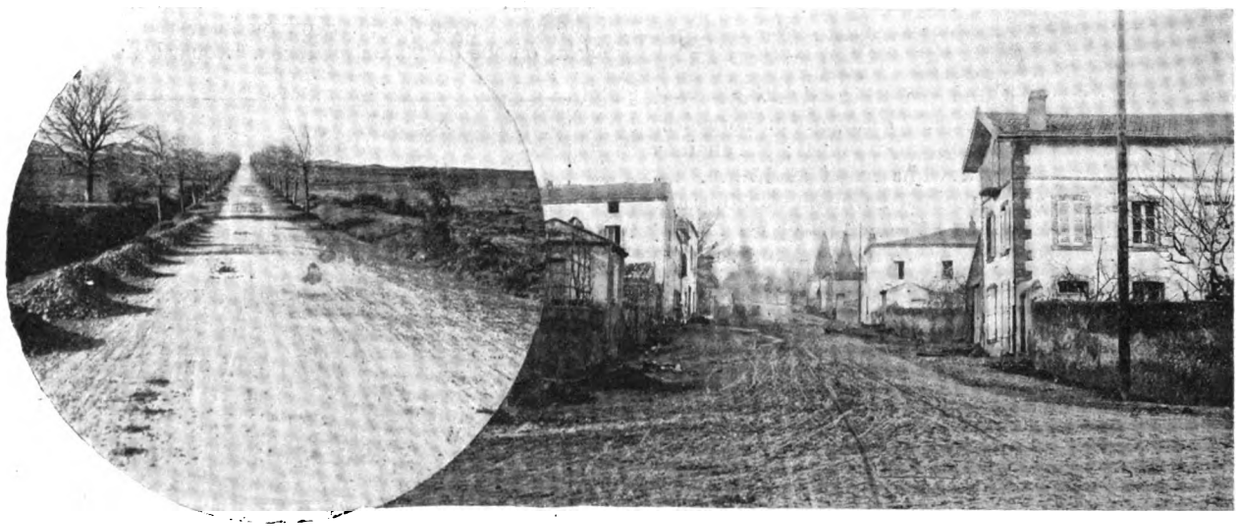
A syndicate has been formed at Gingst to establish public services of motor-cars between that town, Samtens, and Trent. A similar scheme is also under consideration at Willstatt, which town it is proposed to connect with Offenburg on the one hand, and Kehl on the other, by a motor-omnibus service.

The Official Supervision of Garages.

It is announced that the Prefecture of Police in Paris is drawing up a series of regulations for the better control of motor garages, which it is considered should come under the classification of dangerous premises.

◆ ◆ ◆

A Motor-Bicycle Competition.



The annual motor-bicycle competition for the Brugier cup, organised by the Marseilles Moto Club, is to be held on January 15th. The course is over a circuit extending to 122 miles, and already seven entries have been received, these including three Griffon, two Magali, and two Buchet machines.

A Nasty Turn near Pontaumur.

The Village of Laqueuille.

The First Straight Stretch on the Course.

The Probable Starting Point.

MORE VIEWS OF THE AUVERGNE CIRCUIT.

A Renard Train in Tunis.

Official authorisation has been given to a scheme to establish a Renard road train service between Tunis and Bizerta. The train will consist of a tractor, a luggage van, and four 18-seated cars.

◆ ◆ ◆

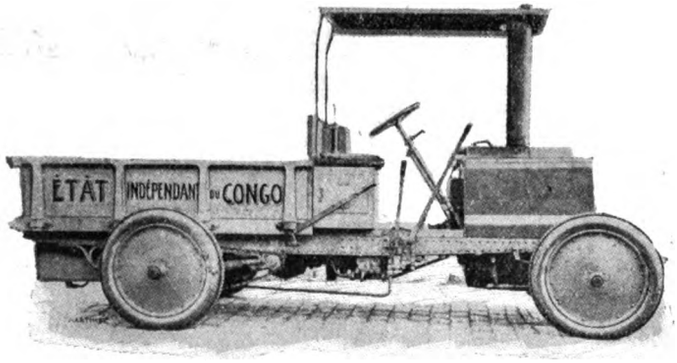
New Low-Tension Ignition Systems.

The Bullock and Simplex systems of low-tension ignition, which were first described in the *Journal*, are apparently attracting considerable attention on the Continent, where new systems on somewhat similar lines are beginning to make their

Digitized by Google

appearance. In the Zabalof device the internal break in the electrical circuit is obtained by a central rod which has an oscillating movement instead of a to-and-fro motion. In the Caron system, which was shown at the recent *Salon*, a magneto is used in place of accumulators to furnish the current. The internal break is obtained by a rod with to-and-fro motion, as in the Simplex method, but Caron builds his magnet round the plug, instead of at right-angles thereto.

◆ ◆ ◆



The Belgian Motor Industry.

The new works of Minerva Motors, Limited, at Berchem, near Antwerp, were inaugurated last week by M. Francotte, the Belgian Minister of Industry and Labour. The company has now three large factories, and during the present year hopes to turn out no less than 5.000 motor-cycle engines, 500 Minervette light cars, and about 400 of the new Minerva automobiles.

◆ ◆ ◆

Steam Wagons for the Congo.

Dr. R. Goldschmidt, the inventor of the "Direct" petrol car with no change speed gear, recently described in the *Journal*, has now turned his attention to steam wagons, and has designed two special types for service in the Congo, where, owing to the absence of good roads, the question of transport is a very difficult one. One of these wagons is fitted with disc wheels shod

with armoured pneumatic tyres, and the other with steel-tyred artillery wheels, a view of the former being given herewith. The boilers in each are adapted to use wood as fuel; the engines are of the four-cylinder type, and while rated at 15-h.p. are capable of developing for short periods as much as 30-b.h.p. The vehicles are very light, weighing without fuel or water only about a ton, and are designed to carry a load of 2 tons. It is stated that the great Belgian iron and steel concern—the Cockerill Company, of Seraing—is taking up the construction of the Goldschmidt vehicles.

◆ ◆ ◆

The De Dion Cup.

The Marquis De Dion has offered a cup to the French Club for an international reliability competition. The Marquis proposes that the trial shall be one not between single cars, but between teams of three of different makes, and that it shall extend over a distance of 1,000 kilometres. The winner would be the firm whose trio of cars made the circuit in the minimum aggregate time. The drivers will be permitted to make such repairs en route as can be performed by the material and tools carried on the cars, but should any car of a team not finish the contest within the maximum time allowed, the whole team will be disqualified. The A.C.F. has accepted the cup, and has referred the matter of drawing up the rules to the sporting committee.

◆ ◆ ◆

Motoring in Algeria.

M. Pierre de Malglaive, a prominent member of the Algerian Automobile Club, has just presented a cup to that body to be awarded annually to the motorist who reaches on his car the most southern part of Algeria. Should the cup be won by the same person three years in succession it will become his own property.

THE "LEONARD" 12-H.P. CAR.

WE illustrate herewith a new 12-h.p. car which is being put on the market by Messrs. J. J. Leonard and Co. to meet the demand for reliable vehicles at a popular price. The car has a pressed steel frame, and in general arrangement follows the usual lines adopted in cardan shaft and live

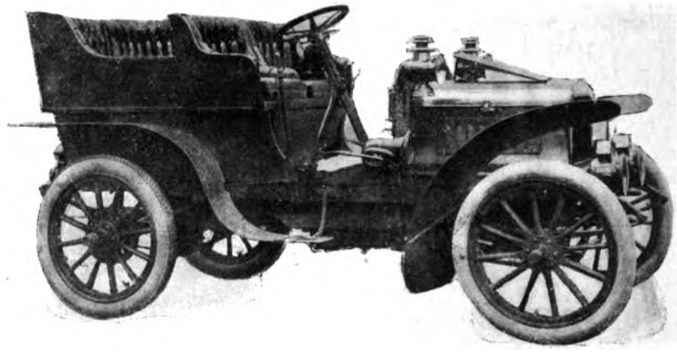


Fig. 1.—General View of Car.

axle cars. The motive power is supplied by a De Dion 12-h.p. engine fitted with the De Dion system of pump oil circulation. The ignition is by accumulators and coil, the latter being mounted on the dashboard as shown in Fig. 2. The power is transmitted through a leather-faced clutch to a gear-box of the sliding pinion type, adapted to give three speeds and a reverse, with a direct drive on the top. A well-designed cardan shaft connects the gear-box with the live axle. The road wheels are of equal size, with 810 mm. by 90 mm. tyres. The steering is of the irreversible type, while ample brake power is provided. The fittings on the dashboard are neatly arranged, as will be seen from Fig. 2, which shows the acetylene generator for the head lamps, a clock, induction coil, water circulation gauge, lubricator for the gear-box, and a force oil feed for the bevel and differential gear on the back axle. Messrs. Leonard are also introducing a

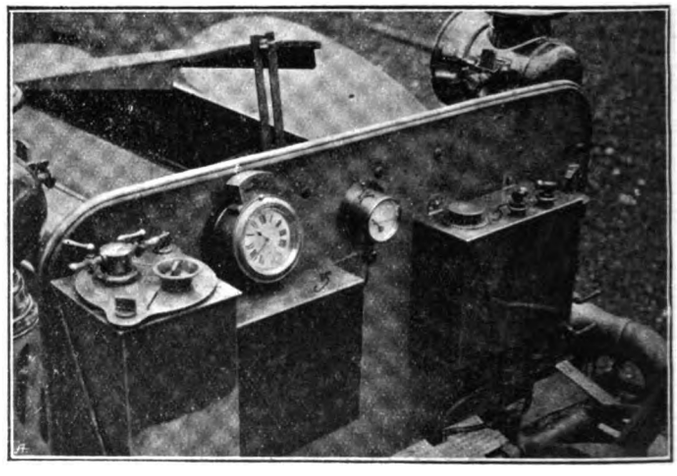

Fig. 2.—View of Dashboard.

double-cylinder two-seated car, with hood and front glass, suitable for medical men, and a 15-20-h.p. touring car, fitted with the new De Dion four-cylinder motor.

AN illustrated catalogue of the various levers and other parts used in the application of the Bowden patent wire mechanism comes from the Bowden's Patent Syndicate, Ltd. The hints that are given on the fitting of the mechanism should be of practical interest to motorists.

THE PARIS MOTOR-CAR EXHIBITION.—IV.

THIS year the stand of Messrs. DE DION-BOUTON AND Co. received an unusual amount of attention, owing to the striking departures which the company is making from its usual practice, particularly in adopting the sliding pinion type of change-speed gear for the larger vehicles. The popular 6-h.p. car is now being fitted with a gear similar to that used on the 1904 8-h.p. car, giving three speeds forward and a reverse; while another new

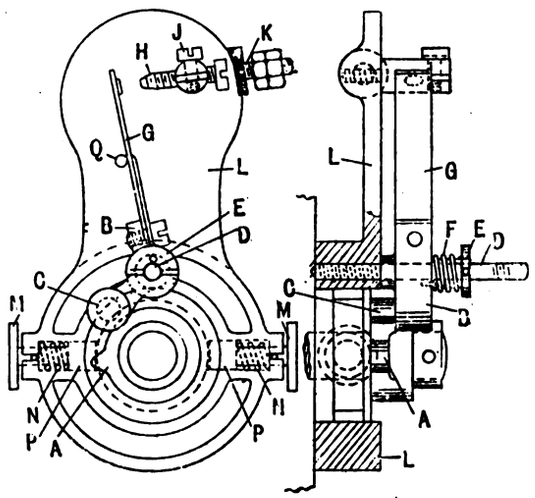

Fig. 60.—Details of new Contact Maker on 6-h.p. De Dion Car.

feature is the adoption of a positive make and break contact-maker in place of the trembler so long used by this concern. Fig. 60 (above) gives a front view and section of the new device, from which it will be seen that the cam A is made with a projection instead of a notch. As the cam rotates its projection strikes the pin C, connected with the bell crank lever B, causing

6. Adjusting bush.
7. Circular groove receiving end of levers 8.
8. Lever serving to produce separation of plates.
9. Fulcrum of lever 8.
11. Spindle connected with lever 8.
12. Piece by which disc 2 is withdrawn.
13. Gudgeon pins driving disc 2.
14. Graphite blocks fitted into discs 1 and 2.
17. Cooling ribs.
19. Ball race.
21. Aluminium gear case.
22. Centreing piece of shaft 23.
23. Change speed gear shaft.
26. Grooved nut for end of levers 8.
32. Coupling piece forming fly wheel.

the latter to move about the pin D. Attached to B by means of a screw is a spring blade G, whose upper end makes contact with the adjustable platinum-pointed screw H. The latter is insulated from the metal body L of the contact breaker, and is connected to the terminal K, which in turn has attached to it one of the wires from the accumulator, the other wire to complete the circuit being "earthed" to some metallic part in connection with the engine. When the blade G makes contact with H the primary circuit is completed as long as the cam presses up the pin C. Immediately the cam A allows the pin to return this takes place rapidly, owing to the action of the spring F, one end of which engages with B and the other with the collar E. The range of movement of the blade G is limited by the peg Q, so that the pin C only makes a rubbing contact with the cam A during the actual time that the circuit is completed. The whole apparatus is so arranged that it can be easily removed *en bloc* from the cam shaft. In addition to the 6-h.p. car the De Dion Company are making vehicles of 8-h.p. single-cylinder and 10-h.p. double cylinder with tubular frames and 12-16-h.p. twin-cylinder, and 15-20-h.p. four-cylinder on pressed steel frames. All these vehicles are provided with a new metal-to-metal clutch of novel design, and sliding gear transmission, giving three speeds forward and a reverse. The motor and ignition of the new 15-20-h.p. De Dion four-cylinder car have already been fully described in the *Journal*. The following description of the new clutch, transmission mechanism and brakes, while referring more particularly to the four-cylinder car, applies equally to the 8-h.p., 10-h.p; and 12-16-h.p. vehicles. The new clutch is clearly shown in the accompanying illustrations. Referring to Fig. 61, it will be seen that the shaft

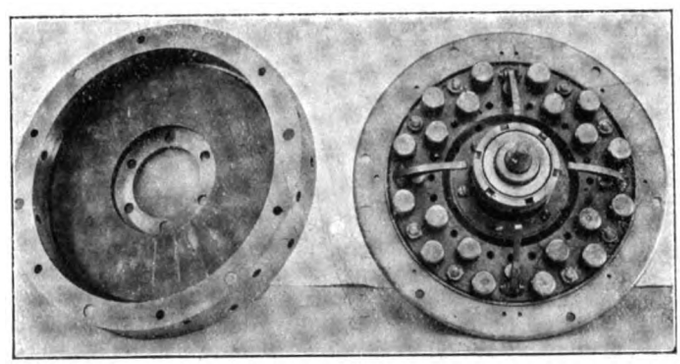

Fig. 62.—Internal Views of the De Dion Metal Clutch.

23, which extends, through cardan points, to the gear box, terminates at its forward end in a disc 3, and is surrounded by discs 1 and 2 fixed on the motor shaft. The fly-wheel takes the form of a hollow drum; to the forward face of the latter is attached the disc 1, while the rear face supports the disc 2. The latter is capable of being moved to and fro through a certain distance by means of the spiral springs 4 (of which there are altogether twenty), the levers 8, and pins 11. When the disc 2 is moved forward the disc 3 is gripped on both sides, so transmitting the engine-power; the levers 8, of which there are four, take their fulcrum on projections 9, and are operated by the grooved bush 26, which can slide on the shaft 23. Holes 15 are formed in the face and periphery of the plate 5 of the flywheel through which air is drawn as the latter rotates, so tending to keep the discs within cool. The outer face of the disc 1 is provided with a series of ribs on its outer face to increase the cooling effect, while in its inner face is inserted a large number of small pieces of graphite 14 to lubricate the discs and so prevent gripping. The disc 3 is perfectly smooth on both sides; the rear disc of the flywheel 22 carries the springs 4, and a series of eight pins which guide the disc 2. The inner face of the latter is provided with graphite insets, and the outer face with radiating grooves. The rear part of the clutch is covered by an aluminium cover 21, made in two halves, and pierced with holes to allow the exit of the air drawn in by the rotation of the flywheel. Provision is made for the ready adjustment of the clutch to take up any wear

Digitized by Google

that may take place. The tension of the springs 4 is relatively weak; but it may be noticed that their action is doubled, since each of the faces of the disc 3 participate in the same driving effort. The doubling of the number of surfaces has therefore the effect of reducing the necessary pressure by half, and the wear is also lessened. The action of the clutch is described as being astonishing, the drive being taken up without shock, and, although between plain surfaces, without any sign of

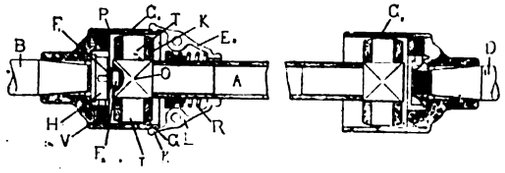

Fig 63.—The Cardan Shaft between Clutch and Gear Box on 15-20-h.p De Dion Car.

slip. Passing now to the transmission, it will be seen from Fig. 67, that although a change-speed gear of the sliding pinion type has been adopted, it is located at the rear and encloses within its case the bevel pinion transmitting the power to the rear live axle, the cardan shaft being located between the clutch and gear box instead of between the latter and the axle, as usual. Details of the joints on the shaft A are given in Fig. 63. The object of the two joints C_1 and C_2 is to remedy possible deformations of the

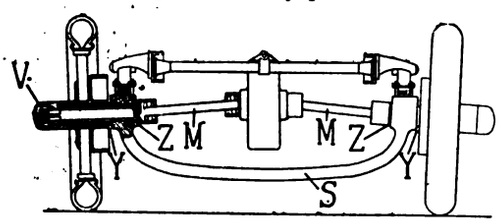

Fig. 64.—Rear Axle Construction of De Dion 15-20-h p Car.

chassis; apart from this contingency, the jolts on the road are sufficient to cause flexions which would be, with a rigid coupling, prejudicial to the running of the car. Provision is also made for the shaft A to have a little play lengthways, not only that it may allow for the variation between the motor and the gear which may result when travelling over rough roads, but also the displacement of the clutch. The change-speed gear, which is illustrated in Fig. 66, is of the sliding pinion type, adapted to give three for-

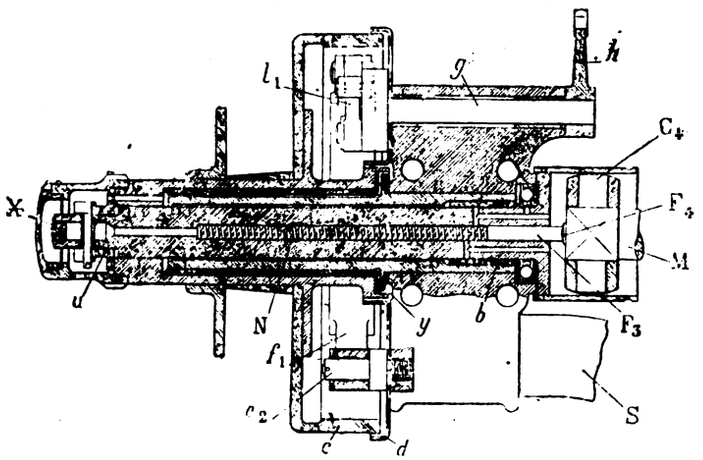

Fig. 65.—Section of Hub of Rear Wheels of De Dion 15-20 h.p. Car.

ward speeds and a reverse. The sliding sleeve 1 (Fig. 66), moves on keys cut on the shaft itself; it carries three gear wheels; the high speed one on the right, the medium speed in the centre; the gear wheel 2, on the left, serves for the low speed when the train is brought towards the left, and if the movement to the right is continued the gear wheel 2 enters into mesh with the pinion 4, which revolves jointly with the larger pinion 5, to produce the reverse. Constantly in mesh with the pinion 6, the pinion 5 revolves at about half the speed of that of the motor. The differential is of the straight pinion type with eight star pinions in place of the usual four. The same as for the motor, a geared oil pump 16 draws up constantly the oil at the bottom of the change-speed gear case, filtered by a gauze, and sends it up to the top in a distributing channel 18. The spindle 19, which actuates the oil pump, is driven by worm gear off the first shaft in the gear box; it is made hollow to allow the oil to pass through its interior and thence be distributed to the gear-box bearings and those of the differential by channels 21 and 22. The well-known type of De Dion rear axle construction is retained, the weight of the car being carried by the fixed axle S (Fig. 64), the differential axle, which has only to transmit the power from the balance gear, being in two parts, each having a double cardan joint allowing both for angular and sliding motions. A spring, placed in the interior of the shaft of the driving wheels (Fig. 65), pushes the cardan M continually towards the differential by means of the thrust pins F_3, F_4. The bearer axles end on each side in a hollow spindle, upon which each wheel rests to carry the vehicle. On the forward end of the secondary shaft of the gear-box is a wide drum 8, on which act two shoes 26, actuated by the levers, clearly shown in Fig. 69. The rear hub brakes are on similar lines, having double shoes, which act internally on drums fixed to the hub, and which a circular sheet-iron dust protector

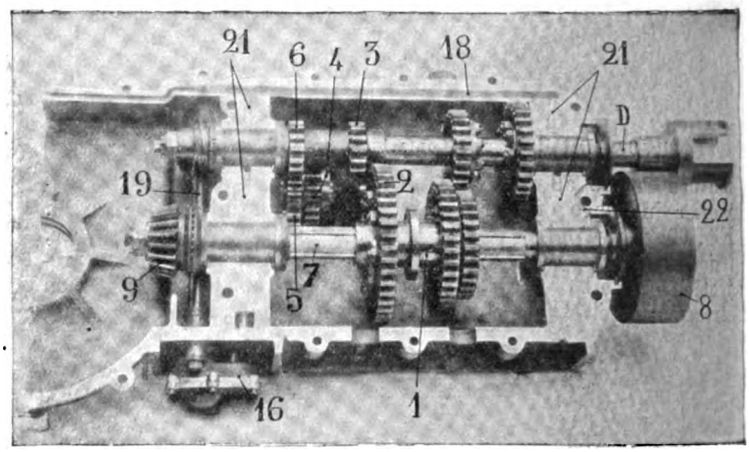

Fig. 66.—The Change Speed Gear on De Dion 15-20-h.p. Car.

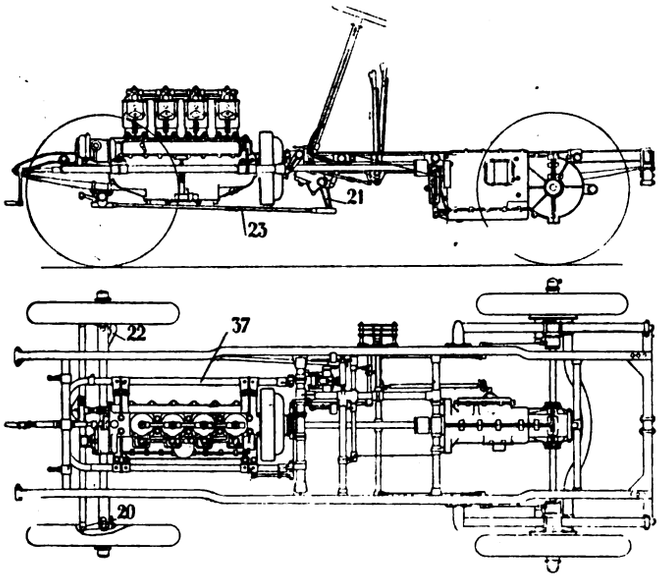
shields from dust and mud. The frame of the vehicle is of pressed steel, narrowed at both front and rear, and provided with several tubular cross stays. Altogether the De Dion exhibit was full of interest, which was increased by the fact that, although delayed slightly by bad weather, Cormier returned from his tour of Europe on one of the new 15-h.p. cars, not only safely, but with an excellent report as to the behaviour of the vehicle.

An interesting display was made by M. PROSPER LAMBERT, of Nanterre, who, in addition to his 9-h.p. single-cylinder and 12-h.p. double-cylinder cars, is now making 16-h.p. and 24-h.p. vehicles, each with four-cylinder motors. In all, the cardan shaft system of transmission is adopted. Among the features of these vehicles is a governor acting on the lift of the inlet valves. The engine of the 9-h.p. car has mechanical valves. The starting handle device is in two parts, and is so geared to the crank shaft that one turn of the handle revolves the shaft about four times. The contact breaker is placed in an accessible position in front, just below the radiator. The clutch and brake pedals are of the push forward type.



An excellent display of the Dixi cars was made by the French agents, LA SOCIETE L'ELECTRIQUE, the types on view including a 7-9-h.p. single-cylinder, 10-12-h.p. double-cylinder, and 12-16-h.p. and 24-30-h.p. four-cylinder. The attraction of the stand was a seven-seated limousine, upholstered in red leather,

Digitized by Google

and equipped with table, revolving armchair seats, electric light, and other conveniences.

Messrs. MICHAUD AND COMPANY had on view a new carburettor known as the "Gallia." It is of the wick type, the petrol falling on to woollen knitted material, around which the air is drawn and pregnated with petrol vapour. In the recent carburettor competition organised by the A.C.F. the Gallia carburettor secured a silver medal.

MESSRS. CHENARD, WALCKER AND CO. had on view two types—12 and 18-h.p. The chief new departure is found in the engine control, the variable lift of the inlet valves having been given up in favour of an improved form of their automatic carburettor. The special combined clutch and brake is still

Figs. 67 & 68.—Elevation and Plan of De Dion 15-20-h p. Car.

retained, as is also the Chenard-Walcker transmission, in which, it may be remembered, the power is transmitted through a cardan shaft to a differential shaft below and parallel with the rear axle. On the ends of the differential shaft are pinions meshing with internally-toothed rings attached to the rear road wheels.

The PIVOT COMPANY, a new-comer to the *Salon*, had a display of its 12-16-h.p., 16-24-h.p., and 24-30-h.p. cars, all fitted with four-cylinder engines. The vehicles, which are being introduced into England by Mr. P. Cuthbertson, Garrick Street, London, W.C., while not comprising any startling deviation from standard practice, show evidence of careful construction. The pressed steel frame is mounted on equal-sized artillery wheels running on ball bearings. The motor has mechanically-operated valves, the inlet and exhaust being on opposite sides. Magneto ignition, automatic carburettor, framed radiator with vertical gilled tubes, and induced draught by means of a fan-shaped flywheel, are other features of the car. Four-speeds and a reverse are provided, the transmission being either through side chains or by a cardan shaft and live axle, as desired.

A good display of Aster engines in sizes extending to 20-24-h.p. was made by LES ATELIERS DE CONSTRUCTIONS MECANIQUES ASTER. The new models comprised a four-cylinder engine with mechanically-operated inlet valves and separately cast cylinders. The valves are interchangeable. The governor is operated from the end of one of the valve camshafts and controls a throttle on the inlet pipe. The crank shaft is provided with five bearings while the pinions driving the camshafts have helicoidal teeth.

The 5-h.p. two-seated car known as the "Minervette" was to be seen at the stand of MINERVA MOTORS, LTD. The single-cylinder vertical engine (90 mm. by 100 mm.) has a two-speed gear enclosed in an extension of the crank case. A single chain transmits power to a small countershaft, on which the clutch is mounted, and thence by another chain to the rear live axle. There are two brakes, one actuated by a pedal and the other by a hand lever. The ignition is controlled from the steering wheel; the water circulation is on the thermo-syphon principle. The Minerva Co. also exhibited a number of cars fitted with 8-h.p. single-cylinder, 10-h.p. double-cylinder, and 14-h.p. four-cylinder engines, the agency for which in England is held by Messrs. C. S. Rolls and Co. In the two and four-cylinder motors the valve chambers are on each side, the cylinders being cast separately. The engine is carried on a bed of angle section steel, fitted to a wood frame reinforced with flitch plates. The change-speed gear gives three speeds and reverse; from the differential shaft the power is conveyed by side chains to the road wheels. Internal expanding brakes are fitted, the springs are of good length, and the lubrication is automatically controlled by the engine itself. Altogether the 14-h.p. four-cylinder car is a very fine piece of work, especially having regard to its relatively low price, and should attract a considerable amount of attention.

LA SOCIETE VINOT AND DEGUINGAND are making four types of four-cylinder cars—10, 14, 20, and 30-h.p. Mechanically-operated inlet valves, on the opposite side to the exhaust, are adopted. The frames are of wood and steel or of pressed steel construction. The change-speed gear, which is of the *train baladeur* type, has been altered, and is now of the Mercedes type. The change-speed lever is on novel lines. By pressing a spring it operates at three different heights; in the highest position it gives two forward speeds, in the middle two more, whilst in the lowest it puts in the reverse gear.

LA SOCIETE DES AUTOMOBILES PILAIN, of Lyons, had on view a 20-h.p. four-cylinder car which was of interest on account of the system of transmission adopted. The change-speed gear-box, which encloses the differential, is placed well to the rear; the two halves of the differential shaft are provided with double cardan joints, and terminate in pinions which mesh with spur wheels bolted to the rear road wheels.

M. C. L. CHARLEY exhibited a 40-h.p. Mercedes car, provided with a novel system of compressed air brakes to all the four road wheels. The arrangement is made in accordance with the Cavello-Charley patents, and consists of a pump driven off the engine through a clutch and gear wheels. Air is pumped

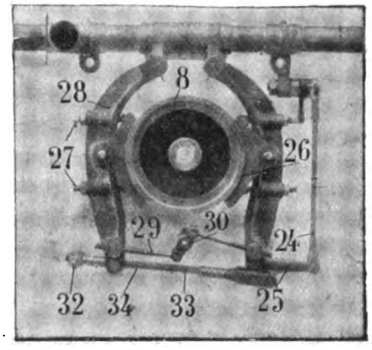


Fig. 69.—The Pedal Brake on De Dion 15-20-h.p. Car.

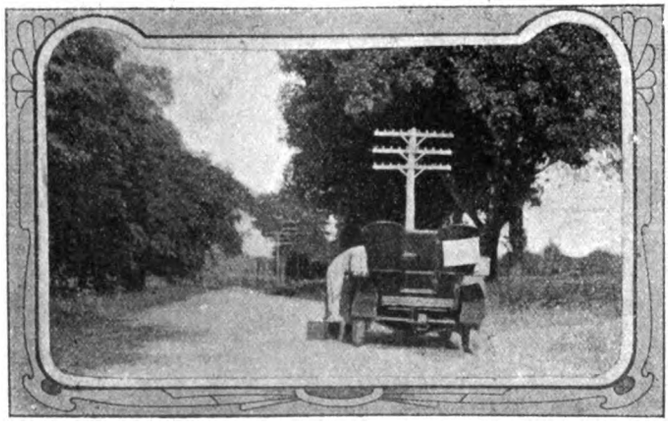
into a reservoir corresponding in shape and size to an exhaust box and fitted with a relief valve. The brakes themselves each consist of a pair of plungers, which force shoes against the inner sides of the brake drums. The control is from a small lever near the steering pillar, and as the device supersedes the ordinary hand-brake system the driver has only the change-speed lever beside him. By slightly moving the controlling lever the clutch is withdrawn. A more pronounced movement releases a quantity of air from the container into the plungers of the brakes, which are fitted internally with leather washers. The device can also be used to pump up the tyres and for restarting the engine. It will be interesting to watch whether the arrangement fulfils in practice the various claims made for it.

(To be concluded).

Digitized by Google

SOME USEFUL NOTES.

WHEN running down a long, steep hill, particularly if the route is unfamiliar, it is a good plan to put the low gear in before starting down, and then stop the motor—usually by switching off the ignition current. The foot brake can now be put on sufficiently to disengage the clutch. In case the brakes fail to hold the car from attaining too high a speed, the motor may be used as an emergency brake by allowing the clutch to engage. This will prevent the car from attaining an excessive rate of speed, inasmuch as the movement of the car will rotate the motor against compression.



◆ ◆ ◆

SHOULD, by accident, petrol catch fire, the most effective way to extinguish it is to stop the access of air to the combustible, *i.e.*, smother the flame. Since petrol is lighter than water, it will float on the surface of the latter, and any attempt to extinguish it with water usually results in spreading the flame. It is therefore advisable to have a supply of sand near at hand in the garage, which can be thrown on the burning petrol. Aqua ammonia is also a good extinguisher of petrol fires, and a large bottle of it dashed upon the floor of a motor-house will often put out quite a stubborn blaze. It is scarcely advisable, however, to remain in a stable in which any quantity of ammonia has been set free.

◆ ◆ ◆

WHEN the inlet-valve spring is not strong enough, the valve does not close with sufficient sharpness, and some of the mixture is swept back, by the rising piston, through the inlet pipe, towards the carburettor. Great care should be exercised in seeing that the inlet valve spring is sufficiently strong in cars of the 3½-h.p. Benz type, in which the carburettor is near the contact-breaker, and has its air-inlet so situated that a draught blowing through the inlet pipe, *away from* the engine, will spray petrol vapour out of this air-inlet on to the surrounding mechanism. When this occurs the petrol may be ignited by a spark from the adjacent contact-breaker, and a serious conflagration result.

◆ ◆ ◆

When "Useful Notes" are Wanted.

◆ ◆ ◆

WHILE a sudden obstruction of the water circulation pipes of a petrol-motor is quite rare, a gradual accumulation of deposit is quite common where the water is hard, containing lime, and such deposit may become loose, as does the scale in a kettle, and, gathered in one place by the circulation, may obstruct the flow. But before this takes place there must have been a notable gradual impairment of the cooling system's efficiency, not only from the reduced cross-section area of the flow, but much more because the scale greatly interferes with heat radiation, being a poor conductor. It is well to remember, however, that a loss of cooling efficiency will be noticed by the motorist only when very hard work is required of the motor on a hot day, while ordinarily less cooling will even increase the motor power.

MOTOR CYCLING NEWS.

AMONG the new features of the 1905 model of the Rex motor-bicycle are the "beehive" silencer and the double air draught to the cylinder, both of which arrangements we are this week able to illustrate. Fig. 1 shows the cylinder with the beehive silencer removed, while Fig. 2 includes an internal view of the beehive. The double air draught is caused through the cylinder being cast with an air passage between the cylinder proper and the silencing chamber; the air passes in at one end of the cylinder and out at the other. A passage is left between the chambers of the two mechanical valves, so

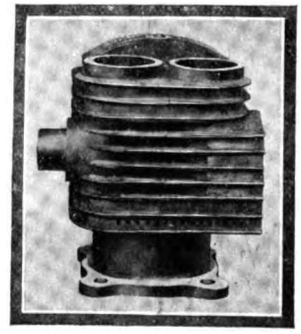


Fig. 1.

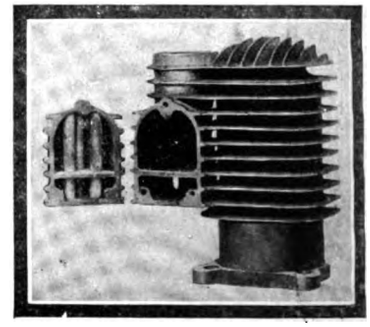

Fig. 2.

that another current of air joins that circulating round the cylinder proper. This air draught reaches to the valve seatings, so that a very high degree of cooling is obtained. With regard to the silencer itself, when the exhaust valve opens the gas expands into a large cavity formed in the top of the beehive; it then filters through a series of perforated pipes into the lower chamber, which spreads the whole length of the cylinder, and escapes through holes perforated between the cylinder flanges. By this system back pressure is claimed to be reduced to a minimum, while the engine is silenced without the use of the exhaust pipe, which, the Rex Company maintain, sets up a large proportion of the back pressure and over-heating usually experienced.

◆ ◆ ◆

THE Auto-Cycle Club's 1,000 miles trial for motor-bicycles will be held from April 3rd to 8th. The weight of the bicycles is not to exceed 100lb. in complete touring trim, without oil, petrol, accumulators, lamp, number-plates, horn, tool-bag or stand. and 11 stone each will be a minimum weight allowed for drivers, any weight below this having to be added. The competition will take place from some central point, journeys out and back of about forty miles each way being made each morning and each afternoon over various routes to be selected. Hill-climbing tests, brake trials, and a speed test will form part of the competition.

FROM Messrs. Bryant and May, the well-known manufacturers, comes a sample box of a special motor match they have lately introduced; the matches, which are 4¾ ins. long, should meet a want amongst motorists, who frequently experience great difficulty in lighting lamps, etc., as they will flame for 20 seconds and keep alight in the strongest wind.

MESSRS. STRADLING AND PLENTY, LIMITED, has been registered with a capital of £9,000 to acquire the business of cycle manufacturers and agents, manufacturers of cycle fittings and parts, etc., carried on by Mr. J. Stradling, at 79, Northbrook Street, Newbury, and the business of motor engineers, motor-car agents, garage proprietors, and dealers in motor-cars and accessories, carried on by Messrs. J. Stradling and E. P. Plenty in partnership. Mr. J. Stradling and Mr. E. P. Plenty are governing directors.

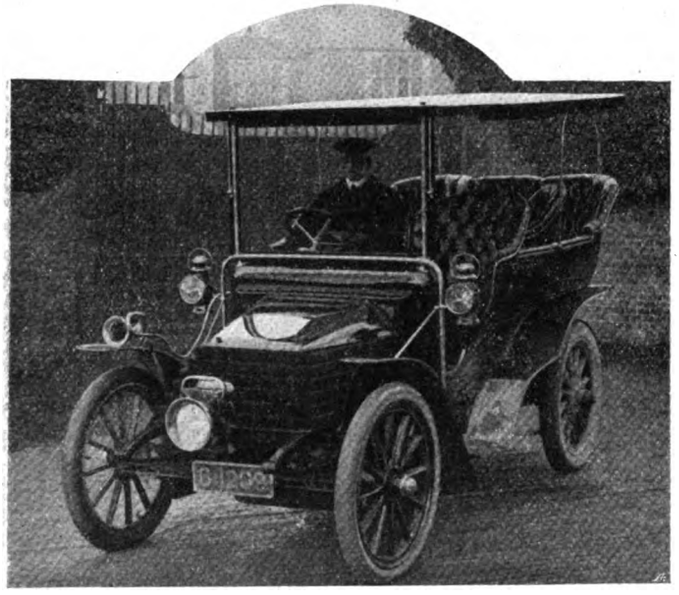
HERE AND THERE.

Mr. E. A. Gilburt has removed to 80A, Salusbury Road, West Kilburn, N.W.

We understand that Messrs. Horner and Sons have obtained the sole agency for Diamond tyres.

The Benz Company have lately completed a 35-40-h.p. Benz-Parsifal landaulet for the Grand Duke of Sachsen-Weimar.



The Limbourg Automobile Club has just been formed. with head-quarters at Hasselt, Belgium, and M. Palmers des Groote as first president.

The Bishop of Liverpool, like the Bishop of Winchester, is becoming a motorist, using a car for the purpose of his diocesan visits.

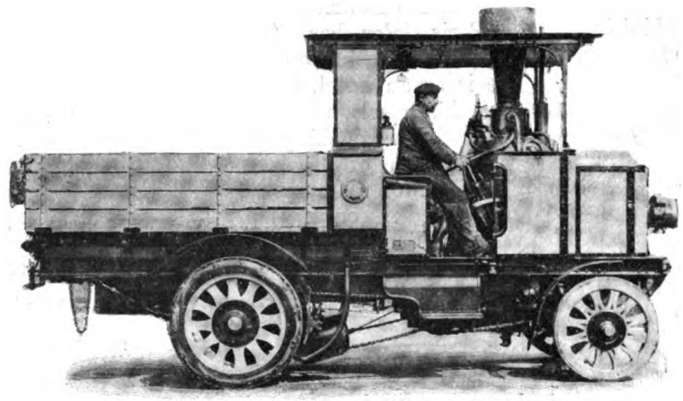
The Right Hon. Earl Wilton has ordered a 1905 F.I.A.T. car, to be fitted with a specially large Rothschild body, from the British Automobile Commercial Syndicate.

Messrs. J. Liversidge and Son, Limited, inform us that they have appointed Mr. A. Casson, 44, Haymarket, S.W., their representative for the sale of the De Nevers patent grooved solid tyres, at whose offices sample tyres can be seen.

We illustrate herewith a special car recently delivered to Lord Hindlip by the Wolseley Co. It is of 24-h.p., and fitted

with a long double-tonneau body with "tulip" seats. A departure from usual Wolseley practice is the fitting of a curved dash, on which is mounted a plated rail, which greatly adds to the car's appearance; this rail is extended to serve as a support for the front portion of the canopy, where a glass weather screen is also fitted.

Messrs. Francis Mulliner (1904), Limited, has been registered, with a capital of £5,000, to acquire the business of coach and carriage builders and harness makers carried on at Liverpool by Francis Mulliner, Limited. Mr. R. Shave is managing director.

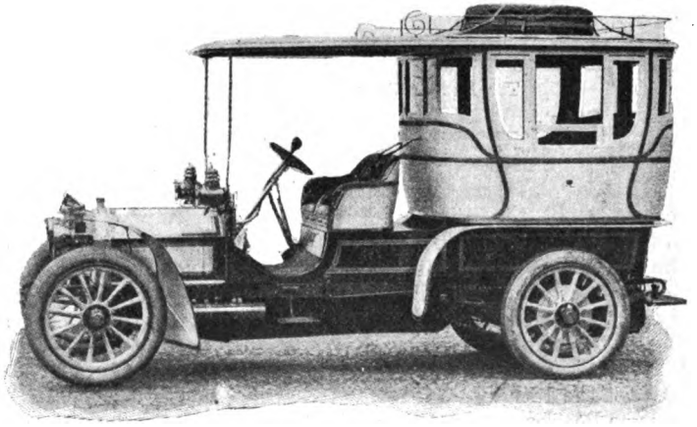


As we have frequently pointed out, medical men are largely making use of the motor-car in their work. Among the latest to adopt the automobile is Dr. Gosling, of Worcester, who has recently acquired a 6-h.p. Wolseley from Mr. James Fryer, of Kington, Herefordshire. The doctor evidently intends to use his vehicle in all weathers, it being fitted with hood and front glass.

The Beaufort Motor Company inform us that all their 1905 cars will be fitted with a tail-lamp having an optical condenser which will throw a powerful beam of light on the off side, so that the driver, by merely looking round, will be able to tell at a glance whether his tail-lamp is alight or not.

Messrs. H. Andrew and Co., of Plympton, Plymouth, send a neat calendar for 1905.

On the 7th prox. the Ladies' Automobile Club will have an illustrated lecture on "Motor Mountaineering in the Alps," by Captain H. P. Deasy.



One of the oldest builders of steam wagons in France is La Société des Chandières et Voitures à Vapeur, systeme Scotte.

The accompanying illustration depicts their latest production—a wagon designed to carry a load of four tons, and to haul on trailers a further six to eight tons.

The German Club has definitely announced that two places in the German team for the 1905 Gordon Bennett race have been allotted to Mercedes cars, and that an eliminating contest will be held to select the third car.

The "De Fornier" detachable non-skid for motor tyres, which Mr. W. J. Mayer is putting on the English market, has features which should commend it to the favourable notice of motorists. It is extremely simple, and can be used on any tyre, from which it can be detached in a couple of minutes. On each side of the "De Fornier" protector is a complete circle composed of thin metal sectors, which are brought together by screw bolts. It is claimed that the device cannot creep, and that side play is impossible. The whole of the rubber of the tyre, is protected, effectually preventing punctures as well as side slips. The non-skid is of pleasing appearance, and a good quality of chrome leather is used by the maker—factors which should materially assist Mr. Mayer in placing the "De Fornier" protector on the market.

The 28-32-h.p. Mercedes recently completed for Kaiser Wilhelm.

The Woolwich, Blackheath, Eltham and District Motor Company, Limited, has been registered, with a capital of £20,000, to carry on the business of motor-car manufacturers, proprietors, etc. The first directors are Messrs. J. J. Messent, W. Busbridge, F. Hoar, E. Furlong, and G. R. Habershon. The registered office is at 10, New Road, Woolwich.

We learn that the car which is being used in Manchuria by General Kuropatkin is an 18-22-h.p. Mercedes.

Messrs. A. Ransome and Co., Limited, are giving up their Chelsea premises and opening new London offices at 63, Queen Victoria Street, E.C.

It is reported that plans are being perfected by an English syndicate at Victoria, B.C., for the erection early next spring of a garage which will be the finest of its kind in Western Canada.

We hear that the De Dietrich Pullman car which was on exhibition at the Paris *Salon* has been sold for £2,000. The purchaser of the car is starting on a long tour later in the year, and will use it as an hotel, sleeping in it, and carrying a servant to cook his meals, the vehicle being fitted with every convenience, including cooking stoves and utensils, etc.

An interesting feature of the 12-h.p. double-cylinder car made by the Phœnix Motor Company, of Southport, is the variable lift device fitted in conjunction with the mechanically-operated inlet valves. The arrangement is illustrated herewith in plan and part sectional elevation. As will be seen, the inlet valves are actuated by rocking levers (A) mounted on

The Phœnix Variable Lift Inlet Valve.

A. Tappet.
B. Eccentric mounting for A.
C. Spindle for B.
D. Nut holding down bridge-piece.
E. Swinging bolt for quick detachment.
F. Bridge piece.
G. Valve actuating rod.

eccentrics (B), the spindles of which are carried and contained in the valve bridge. By the rotation of the eccentric spindles the lift of the induction valve can be varied to any desired degree, and this varied lift is found to control the engine sufficiently without the intervention of a throttle valve, so that there is always a full passage between the carburettor and the valves.

On the 13th ult., at Fresno, California, Barney Oldfield, driving the Peerless Green Dragon, broke all world's track records for from 25 to 50 miles. The former was done in 23 min. 31 1-5 sec. and the latter in 48 min. 39 1-5 sec. The 15 mile record was also broken, his time being 14 min. 3 3-5 sec.

Mr. Havelock Lonsdale, who is responsible for the Star series of Christmas cards, utilised his motor-car during Christmas week almost hourly in conveying cards from his works, at Accrington, to the post office. But for the automobile it would have been impossible to have kept pace with the work.

Mr. E. Nordon has been appointed secretary of the Canterbury (N.Z.) Automobile Association.

The United States Consul at Quebec believes there is a good future for the motor-boat in that city.

A garage has been opened in the Market Square, Retford, by Mr. C. Clark, where accessories of every kind will be stocked.

The Rotorua Motor and Coaching Company has been formed in New Zealand to develop tours by motor-vehicles throughout the colony.

The Institute of Chauffeurs, Westminster, has, we learn, been appointed British agent for the petrol cars of La Société La Metallurgique, of Brussels.

La Societe des Automobiles Eugene Brillie have just supplied two large petrol motor omnibuses for a public service between Tarbes and Trie-sur-Baise, France.

A new garage for motor-cars is to be opened near the Eagle Hotel, Snaresbrook, by Messrs. Burns, Dick, and Co. This should be a great convenience to motorists visiting Epping Forest.

The Manchester and Milford Engineering Company, Limited, has been registered with a capital of £10,000, to carry on the business of mechanical engineers and motor-car manufacturers.

The first prize in the Paris *Salon* Tombola—a 10-h.p. Richard-Brasier car—was won by a lady, Madame Rousset, of Paris. The second prize, a Dufayel piano, was claimed by a visitor from Hungary.

From Messrs. Jarrott and Letts, Limited, comes a copy of the new descriptive catalogue of Crossley cars they have just issued. The illustrations are exceedingly clear, and include cars fitted with different types of bodies.

The Clyde Cycle and Motor Car Company, Limited, of Leicester, have sent us a copy of a booklet entitled "The Clyde Motor Car: How to Use and How to Drive It," they have just issued. The work should prove indispensable to all users of Clyde cars, as it gives in compact form complete instructions as to the adjustment and lubrication of the various parts of the mechanism, and also a number of useful hints taken from the *Journal*.

The Motor Cartage and Transport Company, Limited, has been registered, with a capital of £20,000, to acquire as going concerns and amalgamate the businesses of the Motor Transport Company and of the Motor Cartage Company, to adopt agreements with Mr. E. G. Pamplin and Mr. G. Monro, jun., and to carry on the business of general carriers, etc. The first directors are Messrs. G. Monro, jun. (chairman), W. Deighton, and E. G. Pamplin, and the registered office is at 30, Ben Jonson Road, Stepney High Street, E.

Messrs. Friswell, Limited, who are adopting as their motto "everything *and* the motor," have sent us a catalogue of their latest department, viz., clothing, which has been put under the direction of a West End clothier who has had considerable experience in motor matters. Illustrated in these pages are several good types of leather clothing as well as waterproof coats. A special feature will be made of ladies' rainproof motor coats as also leather clothing to measure. Novelties in head gear, rugs, goggles, and accessories of every description complete a catalogue which will doubtless find a place on the reference shelves of many a motorist throughout the kingdom.

The receiver and manager of the Motor Manufacturing Company, Limited, has removed his London offices and showrooms from New Bond Street to 151-3, Wardour Street, Oxford Street, W., where there are on view a large number of the well-known M.M.C. cars of all the latest patterns. Orders for cars, motors, spare parts, accessories, repairs and the storage of cars receive careful attention at the works at Coventry. It is hoped that arrangements will shortly be made to carry on the M.M.C. business in the future, but in the meantime owners and prospective purchasers of M.M.C. cars may be assured that their orders will receive prompt and careful attention either at the London showrooms or at the Coventry works.

CORRESPONDENCE.

[*Letters to the Editor should be addressed to the new offices, 27-33, Charing Cross Road, London, W.C.*]

THE OPERATION OF THE MOTOR CAR ACT.

To the Editor of *The Motor-Car Journal.*

Sir,—So far as I can make out from conversations with the various Chief Constables and other persons in authority in Yorkshire, the first year of this Act has passed off satisfactorily. The increased speed limit has been of service in allowing the average motorist to increase his usual speed on the road, without the previous dangers of the 12-mile per hour Act.

There has been a diminution of the police trap, and where this has been used, it has generally been in a place where fast driving was not safe. Everybody has got almost used to the identification marks, and it is interesting to note how the cars are now getting a large variety of strange letters. For instance, all cars in, say, Leeds, during the first two or three months had the initial letter U, and any other letter perplexed the pedestrian onlooker, but now, owing I suppose to changes of ownership, etc., almost all letters may be noticed.

There have been many applications by various authorities for speed restrictions in areas under their control, notably Beverley, Huddersfield, Todmorden, and Leeds, and of the few enquiries held, only the Beverley authorities obtained a restriction on one short piece of tortuous highway to their old-fashioned town, and as this is a very bad place I do not think any man could drive along it at above four miles per hour.

When the Bradford Council proposed applying for a speed limit, a deputation of the Y.A.C. met them and talked the matter over, the Council then coming to the sensible decision to leave the matter over for six months to see how the Act worked. During a conversation with the Chief Constable I asked him his opinion of motorists, and he stated that everything was working well, no trouble had arisen with motorists, and he should advise the Council to abandon the idea of application for speed limit. Certainly there are furious drivers passing through towns yet, but they are getting few and far between, and eventually they will get caught.

Getting away from the point, but still of interest, it is high time that something was done to get a universal lighting Bill passed for all vehicles. Sometimes whilst driving on the dark roads, during this misty weather, one may approach quite within a few yards of the rear of an unlighted dray or large van, and it might easily cause a nasty accident.—Yours truly,

A. W. Dougill,
Hon. Sec. Yorkshire Automobile Club.

To the Editor of *The Motor-Car Journal.*

Sir,—In my opinion the outlook of the motor-car, both as an industry and a sport, is on the whole good. Perhaps, however, the outlook is better from the former point of view than from the latter, as there is no doubt that the Motor Car Act has severely handicapped the sporting side. England, unfortunately, has but few spots where, free from the restraint of the law, speed trials may be indulged in.

The sportsman, keen as he may be, is not, however, going to be the *raison d'etre* of the motor industry. The advent of the covered-car and landaulet has opened up a much more extended market for the motor-car, a market which is more solid and less liable to be the sport of fashion. There is no doubt that this market is steadily on the increase, and the number of cars of the covered variety which has been put upon the road during the past year is particularly noticeable. For this type of vehicle, the car that can be used for all purposes and in all weathers, in other words, the car that takes the place of the carriage, I think there is a particularly bright prospect in the present year.—Yours truly,

Hugh H. Gregory.

To the Editor of *The Motor-Car Journal.*

Sir,—Thanks to the broad-minded spirit in which the powers that be have administered the Act in this district, Sheffield automobilists have had nothing to complain of, the numbering has not been found any great hardship, whilst we can now drive at a reasonable pace without fear of being held up. Police traps are unknown within a twenty mile radius of the city, the local authorities acting wisely in the belief that a few beneficent cautions would have a better and more far-reaching effect than a system of espionage and traps—in fact, as a gentleman in an official position intimated to the writer shortly after the new Act came into force, "We prefer to trust to the good sense of the general body of motorists and constrain them to assist us in doing their own police work." And I believe they have been satisfied with the result.—Yours truly,

Fred. B. Cawood,
Hon. Sec., Sheffield Automobile Club.

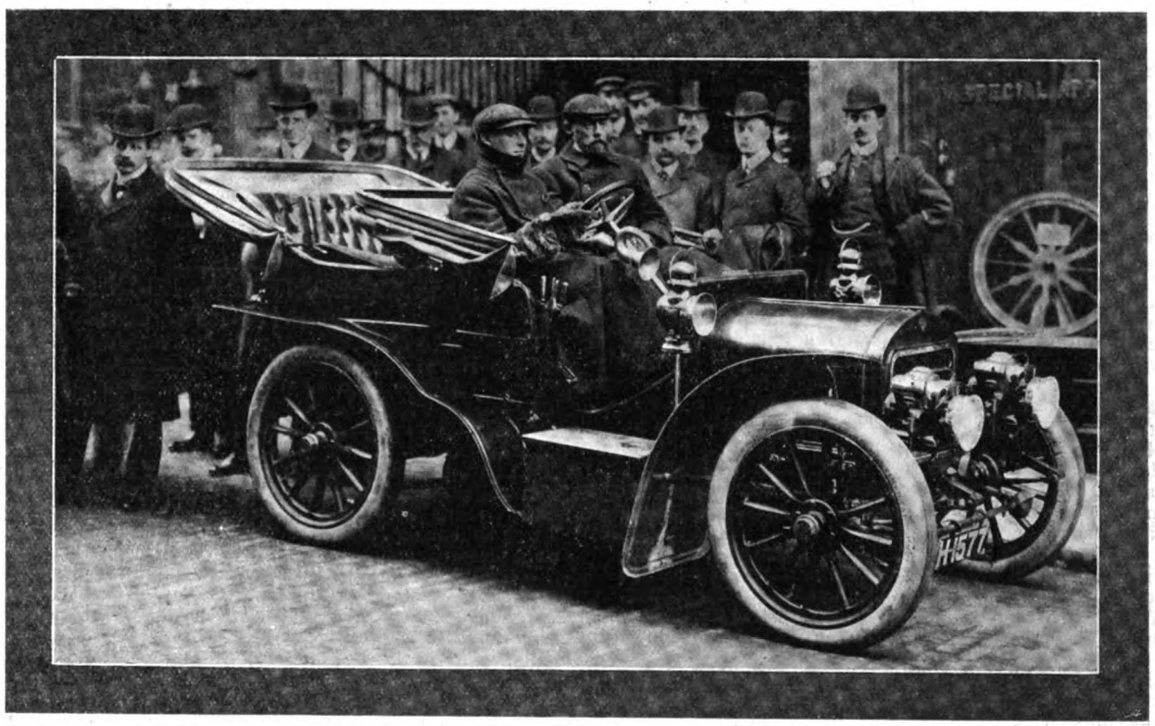

Photo by] The Siddeley 12-h.p. Car starting on its 5,900 Mile Pilgrimage (*see page* 923.) [*Argent Archer.*

THE USE OF THE ACCELERATOR—FOOT v. HAND CONTROL.

To the Editor of *The Motor-Car Journal.*

Sir,—Your correspondent Mr. J. Coop confesses himself to be a nervous driver, and to have lost his head in the quiet and seclusion of his own coach house—a poor combination for a motor driver. Let us hope there are not many about. I do not, therefore, think his criticisms on foot control will carry much weight. I am a novice, having only driven a car little more than six months, and do not know what nerves are. My first and present car is a four-cylinder 16-h.p. vehicle, and after three lessons of half an hour each in Regent's Park I took over the car and drove to my home in Ireland *via* Holyhead. If I had lost my head at any time and used the wrong pedal I would not have had the pluck to confess it. Who could make such a mistake as to use the accelerator pedal driving into a yard, much less a coach house? My experience is that after a day the use of the two pedals becomes second nature. In traffic, or when careful driving

Digitized by Google

required, the foot naturally leaves the accelerator pedal and hovers over the brake to be ready instantly to cram down both clutch and brake pedals; in traffic the right foot goes to the accelerator pedal to dart through an opening, but at once goes back to the brake pedal, and it is only on open roads, when the driver can see a long way, and there is no traffic and no cross roads, that the foot remains near or on the accelerator pedal, and that any mistake can happen. I would make this suggestion, that in a car where the push pedal is used, the accelerator pedal should be a press down one, and *vice versa*; this would help the nervous driver and the day dreamer.—Yours truly,

TALLY HO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to this correspondence, I have a Fiat with foot control, and, after having previously driven other makes with hand controls, I much prefer the foot method.

One point which has not, I think, been previously mentioned is that with the foot control as usually fitted, in case the driver should have a fit or faint the foot would generally relax or slip off the pedal, and thus materially reduce the pace of the car, and perhaps avoid a serious smash.

My car has also a special extra hand control, and I like to have both, as under certain conditions it is useful, but I generally drive on the foot accelerator alone.—Yours truly,

H. K. G.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the article by Mr. Richardson on "The Use of the Accelerator—Foot v. Hand Control," in your issue of 10th December. I may say that we have experimented very widely on various systems of control, and, needless to say, we consider the method adopted on our Albion cars the best, as we have selected it after extended trials of various methods. As you are probably aware, our engine is entirely controlled by the Murray patent governor, which not only controls the speed of the engine by controlling the amount of mixture, but also controls our patent carburettor at all speeds and loads in such a way as to ensure the most efficient and most economical mixture under all conditions, and also controls the advancing and retarding of the ignition. The governor can be instantly set by the driver to hold the engine at any speed from 200 revolutions per minute up to 1,000 revolutions; and at whatever speed it is set for the time being, the car maintains this speed up and down hill and on the level without any intervention or attention on the part of the driver, provided, of course, that the hill is not too steep for the car to negotiate on that gear. The lever controlling the governor is arranged below the steering wheel, and it can be controlled with the fore-finger of the driver's right hand without necessitating the removal of his hand from the steering wheel. This system of control we venture to say is perfect, as the car can be slowed down to five or six miles an hour on the top speed, and it is seldom necessary to de-clutch even in busy traffic unless the driver has to make a dead stop.

We have the strongest objections to a third pedal for the accelerator, as we think the brake and clutch pedals provide ample occupation for the driver's feet, especially in an emergency. Driving in weather like the present, with heavy rugs, etc., mistakes in changing from one pedal to another are sure to be made, except, perhaps, by the most expert drivers. In our car we have eliminated the mixture and ignition advance levers, which only an expert driver could adjust with any degree of accuracy, and which in the hands of an inexperienced driver were, especially the latter, a fruitful source of trouble.—Yours truly,

F. BLACKWOOD MURRAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the interesting subject "Foot or Hand Control," now being discussed in the *Journal*, the plan is not new, and I have tested it myself on a Mercedes car for many thousands of miles, and it answers well, I think. I simply have a thumb switch on the left hand arm of the steering wheel, and work it with the left hand thumb; the switch is earthed to the arm of the steering wheel, and the other wire is carried to the distributing board on the motor. When I change speed I do not have to close the throttle at all, and consequently I do not disturb the action going on in the carburettor (a most important thing, I think, especially with some of these new carburettors). I suppose silencers would not stand it, but I hardly ever have an explosion in mine, and when I do it is never very bad.

I may say I adjust all my brakes to be independent of the clutch, and with Mercedes hand control and a thumb switch I do not want anything better. From what I read, I think the new Mercedes arrangement will be simply a foot throttle (not an accelerator at all), probably on the lines of the Wolseley, which I think is very good of its kind. If you have a thumb switch, or if you like a foot throttle on Wolseley lines, I do not think you want an accelerator other than the hand control on Mercedes cars.—Yours truly,

T. 136.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The correspondence relative to the above is peculiarly interesting to me, inasmuch as I have for some time been endeavouring to reduce the number of levers required to work my cars. I am sure it must have occurred to all users of cars at various times that they needed two or three more hands or feet in order to work their vehicles to advantage; and this should not be. In my opinion, no car should ever be turned out without some arrangement whereby the engine is controlled when the load is taken from the same. It is not right, and under some circumstances it is positively dangerous, *i.e.*, such as mentioned by Mr. Edge. Up to the present manufacturers have invariably fitted one or two systems, the hand or the foot system of accelerator, and I think that your various correspondents have fairly pointed out the advantages of both of these.

In my opinion, however, neither the hand nor the foot system alone is correct, and I claim the system of control as fitted to my "Sandringham" cars to have a tremendous advantage. I arrange it that my accelerator is placed in a most convenient position, on the top of the spokes of the steering wheel, and this is capable of causing the engine to run at any desired speed from maximum to minimum; but in order to prevent the racing of the engine when the load is removed, I have the clutch pedal so connected with the same working parts that immediately it is depressed the engine is perfectly controlled. This system works magnificently in traffic, or in emergencies such as sudden stoppages, sharp corners, etc., and under no circumstances will the engine race. Both hands and both feet are thus perfectly free for manipulating those parts primarily intended for their use.

I am, however, going still one step farther towards the simplification of the driving of the modern motor-car, and that is in the matter of ignition. Whilst I am aware that this hardly comes under the above heading (so far as the mere speed of the engine is concerned), I trust the fact that a lever is at present required to manipulate this part will justify my introducing the matter. This lever I am now doing away with entirely, and substituting therefor a system of ignition which is automatically controlled and governed by the engine itself. Not only does this reduce the number of levers about the car, but it is the means of obtaining from the engine the maximum of power whether it be driven by the expert or the novice. I am convinced that this system will be bound to become universal in the course of time for reasons which will be obvious to your more practical and expert readers.—Yours truly,

FRANK MORRISS.

MOTOR DRIVERS' ORGANISATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of your admirable *Journal*, allow me to express my approval of your correspondent "Terminal's" letter. In my own case I served two years as a premium apprentice to motor engineering, and have had some considerable experience in repairing and driving cars since, for which I have excellent references, but have been out of employment for some months.

I have known of an instance of a young fellow of well-to-do parents, who was put under a repairer to obtain some knowledge of the motor trade. After some little time he (the repairer) was told he would no longer be required, as this young fellow would try his hand at repairs and work for nothing.

If such a union can be formed, as it may be by all decent motor mechanics combining, I should be glad to undergo any test of my mechanical abilities, as everyone of such would doubtless do, to the advantage of owners and servants. Fair play is required and no favour.—Yours truly,

ANOTHER WOULD-BE MEMBER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reading "A Would-be Member's" letter, I quite agree with him that we should have a society. We ought to have more stringent regulations as to who should be permitted to drive motor-cars. A motorman on an electric tram car has, in every case that I know of, to pass an examination before he is placed in charge of an electric car. I am in charge of petrol motor-cars in a tramway power station, and what I am saying is true to the letter.—Yours truly,

J. M. B.

SEE TO THE BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in the last number of your excellent *Journal* you give a piece of timely advice under the heading "See to the Brakes," and it has occurred to me that the experience of some of my friends might be useful in regard to this matter. They use a simple fluid called Plaxine, sold by Messrs. Riches and Company, a small quantity of which being applied to the drum of the brake cures slipping instantly, or prevents it if a small quantity is occasionally applied. One friend has told me he could stop his car in the middle of a hill; another always carries it to cure a slipping clutch. My impression is that many other motorists might be glad to know of this preparation.—Yours truly,

J. THOMPSON.

CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Cells'" letter in the last issue of the *Journal*, I would state that for the past three months I have been using Boron cells for

Digitized by Google

charging my motor accumulators, which are forty, fifty, and sixty amp-hours (four-volt); for the forty amp-hour six cells in parallel charge them admirably, and leave nothing to be desired; for fifty and sixty amp-hour batteries, eight cells are best in two sets of four. These should be left charging overnight, when the accumulators, if true, will in the morning be thoroughly charged. The relative cost of charging such an accumulator is about 4½d. A four-cylinder car takes a deal of current, and the fact that your correspondent's accumulators show 4·5 volts when taken from the cells is evidence that they have been properly charged. The reason that the voltage falls rapidly would indicate softening of the positive plates. The cells would in this case be best charged by using for each jar 8 ozs. bichrome and 8 fluid ozs. of sulphuric acid; fill up with water, and use solution whilst still hot. If the zincs waste much, use less acid in the porous pots. Both the chemicals and zinc can be obtained without difficulty at any wholesale chemist's or metal works.—Yours truly,

SATISFIED USER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having three (forty ampere hours) accumulators, and at the same time considerable trouble in getting them charged, I have procured a six-cell set of Boron charging batteries; these I keep with solution standing in them and wires attached, and after a run of say 50 miles or so I connect the accumulators up a few hours to the Boron cells; this keeps the accumulators in splendid condition and costs about 1d. each charge. The zincs will last a long time if only a small quantity of acid is used in the porous pots.—Yours truly,

M. HENDERSON.

AN INTERESTING MOTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The replies of Mr. Fortune and of "Saxilby," in your issue of the 24th ult., do not, I think, afford any reasonable explanation of the phenomenon referred to by "Inquisitive One." A moment's consideration will show that any variation in the proportion of oxygen in the atmosphere would be so small as to be inappreciable in the volume of air forming, with petrol vapour, the explosive charge in the cylinder. Then it is difficult to see why equally good running could not be attained at any time of the day by proper adjustment of the mixture. In my humble opinion the motor will probably run better, other conditions being the same, in the evening, when the lower temperature of the air tends to more efficient cooling, which would give a slight increase of power.

Having myself, however, frequently noticed the same phenomena which are mentioned by "Inquisitive One," I have come to the conclusion that they are more apparent than real; in fact, that the increased speed is due to the limited field of vision afforded by the light of the lamps, in the same way that, if in the daytime the eyes are kept fixed on the ground close to the car, it will appear to be moving much faster than if one is looking well ahead. This same explanation will also cover Mr. Fortune's apparent increase of speed on getting into the country from town, the number of lights in which so extend the range of vision as to destroy the illusion to which I have referred. I should suggest that next time "Inquisitive One" thinks his motor has taken "the bit in its teeth" he should try it against his watch, and I think he will find, as I did, that he was only going his normal speed.—Yours truly,

A. 710.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Inquisitive One," I will endeavour to explain where the oxygen comes from, to cause the increase in power. The gain in power is only noticed after a very dry or sunny day, soon after sunset. As we know, pure air is breathed in by all human and animal life. The oxygen contained in it is used to consume any waste matter in our bodies, and is afterwards breathed out by us as carbonic acid gas. Plants, on the other hand, breathe in the carbonic acid gas, decompose it or divide it into its elements (carbon and oxygen), retain the carbon to build up their stems, leaves, etc., and set free the oxygen in the air. But plants can only decompose gases in sunshine, or on very bright days, hence the growth of plants in summer and not winter. If we walk in the country, or near vegetable life, after sunset, we shall feel the effects of this liberated oxygen, by the brisk and lively atmosphere around us. Oxygen supports combustion fiercely, and so a highly inflammable and cool mixture is carried to the cylinders. The engine is given a cool and correct mixture, which ignites readily and almost without any additional heat to the cylinders.—Yours truly,

B.U. 7.

THE LOCOMOBILE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In response to your Croydon correspondent's note in the *Journal* of the 24th ult., I beg to say that I have had a Locomobile fitted with a paraffin burner for over two years and have had not the slightest trouble with the boiler. The car is a splendid hill-climber, if the pressure of steam is maintained. To keep a good pressure of steam, however, experience is required.—Yours truly,

B. 254.

A PLEA FOR THE MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I enter a friendly protest against the reference last week to the effect that "even a motor-bicycle can be made a means of pleasure?" Why this "even"? There seems to be a growing tendency among car-owners (owing to the "kerridge folk" tradition, perhaps) to belittle the motor-cycle.

May I suggest that in all likelihood the ideal delight of fast travelling—the nearest approach to flying that we are, for long, likely to know—is to be experienced on the motor-bicycle? I keep a car as well as a bicycle; I have toured under the fairest conditions and amid the loveliest scenery, yet I have no hesitation in saying that, but for the purpose of carrying a companion, I would not now even consider a car. The trouble of the business is that so few ladies can be taught to handle a motor-bicycle; resort to the cumbrous and usually much slower four-wheeler being, therefore, requisite. The tri-car I dislike as uncomfortable.

The drawbacks to the motor-bicycle are chiefly its unpleasantness on grease and its vibration on very bad roads. On good roads its flight (especially in the case of the high-powered type) is most comfortable and exhilarating to a degree which the mere car-driver is powerless to understand. To ride a high-powered bicycle, however, requires skill and nerve, and I must admit, accordingly, that not everyone is able to face the music. A doctor, discussing this matter with me at the show, observed that he kept his car for wet weather and work, but always resorted to the motor-bicycle when he required "real pleasure." And after all, those who know what it is to skim along the level at "forty" or over and leave big cars

An Oldsmobile in front of the Kremlin at Moscow.

standing on hills, the delicious sweep of the one tracker making the car but a dull vehicle, will not need much argument. For myself I always suspect that the car-driver who despises the motor-cycle is usually unable to ride it. Or again (if one may judge from the awful specimens of mankind seen on cars, on the Ripley Road for example), perhaps the tradesman in his motor "kerridge" is too often prone to consider himself as the superior of all other folk who use the road.—Yours truly,

E. DOUGLAS FAWCETT.

MOTOR-CAR WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like "Inquisitive One" in your issue of 24th December, both back wheels of my two-cylinder Gladiator collapsed. I took advice, and thereupon incurred considerable expense in having new road wheels built by Messrs. Mulliner, of well-selected oak spokes stouter in the centre than the original spokes, and new chain-driving wheels from Messrs. Brampton in metal they specially recommended. I also had a steel ring fixed round the spokes for the studs to pass through, for extra strength. This latter I believe the Gladiator people have also since adopted.—Yours truly,

A. C. DAVID.

GRAPHITIC LUBRICATION OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I sincerely hope none of your readers have introduced graphite into their motors. Some years ago, from reading an article in a Yankee journal, I was foolish enough to try the experiment. I destroyed a number

Digitized by Google

of plugs owing to graphite getting burned into the porcelains, and the motor misfired dreadfully. It almost seemed impossible to get rid of the stuff, once introduced, and it was quite a fortnight ere the motor ran as it did before. Graphite, but only pure graphite, introduced into the gear case and other parts in moderation gives very good results and forms an excellent lubricant in conjunction with grease and oil. But in the cylinder! Well, as I have said, "I have had some."—Yours truly,

GEORGE GIBSON.

LENT PLUG WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When returning from Gravesend to London on the night of Sunday, November 27th last, we found a two-seater car hung up, and on offering assistance the driver asked if we could lend him a sparking plug. We accordingly pulled up, and after testing the ignition lent him a new E.I.C., which immediately rectified the trouble, and after giving him my card we proceeded on our journey, since when we have heard nothing from him.

I trust you will favour me by inserting this letter, as I feel sure the card has been mislaid, and that on learning my address (11, Therapia Road, Honor Oak, S.E.) the gentleman will return my property, as, although the cost in this case is small, one does not wish to make a practice of distributing spares.—Yours truly,

F. DENNISON TAYLOR.

THE LANCHESTER CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the correspondence on the Lanchester car, but note that the writers say very little about the valves, air cooling, petrol consumption, etc., and would be pleased if some of them would answer the following queries:—

(1) Are the valves easy to get at to grind in? (2) About how long would it take to replace a broken exhaust or inlet valve? (3) Are the fans liable to get noisy or out of repair? (4) Will the fans keep the cylinders cool on warm or hot days? (5) Are the nuts and threads standard or only made by the Lanchester Company? (6) About what is the average mileage per gallon? (7) Is the Lanchester Company reasonable or otherwise in its charges for repairs or replacements?—Yours truly,

A. U.

MISFIRING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be greatly obliged if you or any of your many readers will assist me in the following matter:—I am having trouble with the back cylinder of my 14-h.p. Clement-Talbot (high tension ignition.) When the engines are running slowly this cylinder fires just when it thinks it will, which is very seldom, yet it will repeatedly start up on it (not always), but when this is accomplished it then remains inactive for many revolutions. When the throttle is opened, and the ignition lever in any position, it fires regularly; but, as the car is very sluggish and won't climb on its top speed anything like what it used to do, and also gets very hot, I attribute the loss of power to this cylinder.

I have spark gaps fitted, so am sure the coil is right, and have also had the commutator tuned up.—Yours truly,

PUZZLED.

["Puzzled's" trouble seems to point very strongly to faulty coil; undoubtedly the condenser has broken down, or there is a bad contact on the primary. Trouble of this kind is sometimes caused by the burnt oil getting foul of the point of sparking plug, and although when tried out of the cylinder proves all right, short circuits inside when replaced. This appears to be the only suggestion, if coil, sparking plug, etc., are correct.]

CHANGING IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Free Manse" in the *Journal* of the 24th ult., who enquires how to apply electric ignition to a Leon Bollée tandem, if he will communicate or call upon me at the Beehive Works, Ryton Street, Worksop, I will let him know how I have altered mine. Originally the machine was similar to the one you illustrated a week or two ago. I have, however, constructed a new body, put it on springs, altered the steering wheel to centre, fitted electric ignition, and made it an up-to-date car. It is belt-driven, has three speeds, and I can get up any hill I have met with so far. The little machine, which carries three persons, can average twenty miles per hour; I never have any trouble with it, and I can do sixty miles on a gallon of petrol.—Yours truly,

J. NICHOLSON.

SPARE PARTS FOR STEAM CARS.—The manufacturers of the Turner-Miesse steam cars inform us that they keep a full range of spare parts always in stock. Messrs. W. Galloway and Co., of Gateshead-on-Tyne, and Messrs. Paris Bros., of Southport, also send assurance that they hold large stocks of spare parts for American steam cars. In view of these facts, together with the similar assurance from the representatives of the White steam cars, intending users of such vehicles need have no hesitation on that account.

THE LOCAL GOVERNMENT BOARD'S REGULATIONS re HEAVY MOTOR VEHICLES.

THE Local Government Board have had under consideration the report made by the Departmental Committee which was appointed to inquire with regard to any regulations which should be made under Section 12 of the Motor Car Act, 1903. The recommendations appended to the report of the Committee aim at giving effect to the objects of the section by facilitating the development of motor traffic of a heavier character than that at present allowed by law, but subject to the observance of suitable conditions for the protection of the roads against damage, and the avoidance of inconvenience to other users of the highway.

Hitherto the weight of a motor-car, unladen, has been legally limited to three tons. This limit is now raised to five tons. At the same time a corresponding increase is made in the limit on the joint weight (unladen) of the motor-car and trailer, namely, from 4 tons to 6½ tons.

Up to the present time no limit has been placed by law on the weight permissible in the load on a motor-car, but an innovation in this respect is made by the regulations, as it has been generally accepted that an increase in the tare weight of motor vehicles ought to be accompanied by the adoption of some safeguard against an excessive total moving load. The regulations, therefore, make the use of the heavier form of motor vehicle upon the roads legally dependent upon the observance of limitations, not merely on the weight unladen, but on the total joint weight of the load and the car. For convenience of designation, all motor-cars exceeding two tons in weight (unladen) are grouped together by the regulations under the description of "heavy motor-cars," and the joint weight of any heavy motor-car together with its load is restricted in the following respects.

In the first place, the total weight of car and load is limited to twelve tons. Next, the weight borne on any axle is not to exceed eight tons. Thirdly, the weight on any axle at any time is not to be allowed to go beyond the weight accepted as for that axle at the time of the registration of the car (such accepted weight for the axle being termed the "registered axle-weight"). As to the relationship between the above-mentioned limitations of twelve tons and eight tons, it is to be borne in mind that the greater part of any load, approximating to two-thirds of the whole, may ordinarily be expected to be carried on the axle to which the driving power is directly applied.

The question of the character and dimensions of tyres suitable for heavy motor-cars was fully considered by the Departmental Committee, it being felt that the admissibility of a new form of heavy traffic on highways greatly depended upon the arrangements which could be made for minimising wear and tear of the roads. Special and detailed provision is made by Article VI. of the regulations for the purpose of securing a width of tyre duly proportionate to the moving load and the size of the wheels, in cases where the wheels are fitted with ordinary tyres, *i.e.*, tyres which are not pneumatic or are not made of a soft or elastic material. No ordinary tyre is, however, to be less than 5 in. in width. The scale of sizes is laid down in the Article, and tables, fully showing the operation of the scale as regards different sizes of wheels and different axle-weights are contained in an exemplification which the Board have caused to be prepared. As instances of the scale, it may be mentioned that, in the case of a wheel of three feet in diameter attached to an axle with an axle-weight of six tons, the tyre would have to be 8 inches in width, whilst for a similar weight on a wheel five feet in diameter the width of tyre would be 6½ inches.

Where pneumatic tyres or tyres made of a soft or elastic material are used, the width is not prescribed by the regulations, as the practical necessities in such cases will doubtless be enough to secure the selection of tyres of suitable strength and durability and hence of adequate size.

The regulations contain other minor provisions and requirements as to the construction and use of heavy motor-cars. In the case of any wheel with an ordinary tyre, the diameter is not to be less than two feet; all heavy motor-cars are to have suitable and sufficient springs between the axles and the frame; in regard to ordinary tyres, although a smooth surface is usually required, the method of tyring wheels by strips of metal with intervals between them is, subject to definite conditions, not excluded; and cars with a weight unladen amounting to three tons or more are allowed a width of 7 feet 6 inches.

Under the special powers of Section 12 of the Motor Car Act, 1903, the rate of speed allowed to motor-cars generally by the Act is considerably reduced by the regulations in the case of all heavy motor-cars. A heavy motor-car is restricted to a speed of eight miles an hour, or to five miles an hour if the car exceeds in weight three tons unladen or has any axle with an axle-weight exceeding six tons or draws a trailer; but to this rule there are exceptions allowing somewhat higher speeds to cars having pneumatic tyres or other tyres of a soft or elastic material.

With respect to vehicles ("trailers") drawn by heavy motor-cars certain provisions are included, which in several respects are based on those relating to the cars themselves; but there are some special requirements as to trailers. The axle-weight on any axle of a trailer is limited to four tons. If the trailer exceeds a ton in weight unladen, the provision as to the proportionate width of tyres applies; but a minimum width of 3 in. is allowed. A trailer is not allowed to be drawn by any motor-car used as a stage carriage, or for the conveyance of passengers for gain or hire. A trailer does not require registration.

For the purpose of securing that heavy motor-cars shall duly comply with the new requirements as to construction and fittings, some

Digitized by Google

additional provisions have been made with regard to the process of registration. The owner when applying for the registration of a heavy motor-car is to declare (*a*) the weight unladen, (*b*) the axle weight of each axle, and (*c*) the diameter of each wheel. Before registration, the weight unladen and (if the registering authority so direct) the axle-weight of each axle are to be ascertained by or in the presence of an officer of the authority. He is to certify the results, and, if necessary, correct the owner's statement. He is also to satisfy himself whether the tyres (if not pneumatic or not made of soft or elastic material) are of the prescribed dimensions, i.e., of the width required having regard to the size of the wheels and the axle-weight. For the above purpose the car is required to be driven or brought to the place appointed by the registering authority. Detailed entries of the facts relating to the particular car are to be made in the Register of Motor Cars. A new and separate part of the Register in which the entries relating to a heavy motor-car are to be made is prescribed.

It will devolve on the registering authority, under Article III. of the Motor Car (Registration and Licensing) Order, 1903, to furnish the owner of a heavy motor-car with a copy of the entries in the Register relating to the car; and upon receiving a copy of these entries the owner is to cause the unladen weight, the axle-weight of each axle, and the highest permissible rate of speed under the regulations for the particular car to be painted or otherwise plainly marked on the sides of the car in the manner specified in the regulations, the marking of the weights being placed on the right side, and the marking of the speed on the left. It is suggested that the weights and speeds might be thus indicated:—

The unladen weight	U.W. tons.
Registered axle-weight of each axle	A.W tons cwt.
Maximum speed permissible (in miles per hour)	Speed m. p.h.

With regard to existing cars coming within the definition of "heavy motor-car," it has been found necessary to include certain additional regulations. The regulations, generally, come into force on the first day of March next. The clause, however, in Article XIII. provides a period of grace of six months from that date for heavy motor-cars registered before that date; the object of the clause being to allow time for cars to be brought up before the registering authority, and for any structural alterations to be made which may be necessary so as to alter the cars as to secure that they shall comply with the regulations. The period allowed will avoid an inconveniently sudden disuse as motor-cars of any vehicles which cannot properly be altered.

A further provision, however, is made by Article IV. (5) in order to meet the case of existing cars. Every heavy motor car registered before the date of operation of the regulations must, within six months, be brought before an officer of the registering authority with whom it has been already registered, or must be registered anew, its existing registration being cancelled; and in either case the same procedure must be followed as in the case of a first registration of a heavy motor-car under the regulations. The provisions as to weight unladen, axle-weight and tyres will apply as fully as in the case of a new car. But if a car which was registered before the 1st September, 1904, and which has, when unladen, a weight exceeding five tons but not exceeding seven tons, is brought before an officer of the registering authority, and the prescribed procedure followed, compliance with this regulation is to be sufficient authority for the use of the particular car upon the highway.

In every case in which a heavy motor-car is brought up for inspection and not registered anew a certificate of the facts is to be given by the registration authority to the owner, to serve as evidence of the right to use the car. After six months, the previously existing registration of any heavy motor-car in respect of which no such certificate has been given will cease to have any effect.

Article XII. of the Order contains provisions enabling the officer of any local authority having control of the highway, or of any registering authority, to test the weight of the actual load for the time being on any heavy motor-car. The power, however, can only be used if the car is upon a highway within half-a-mile by road from a public weighing machine or other weighing machine which is conveniently accessible.

With respect to bridges, Article XIV. provides for notices being placed on any bridge forming part of a highway, and in each approach to the bridge, with a view of prohibiting the passage over the bridge of any heavy motor-car with a registered axle-weight exceeding three tons on any axle, or with a higher axle-weight to be specified in the notices. Where such notices are placed, cars of the class referred to are not to be driven upon the bridge except with the consent of the person liable to repair the bridge. In the event of disputes arising as to the insufficiency of any bridge to carry the traffic specified in the notices, the Article provides for the settlement of the matter by resort to arbitration.

The same Article prohibits heavy motor-cars, where the axle weight of any axle exceeds six tons, from being driven on a bridge forming part of a highway, if another heavy motor-car, or an ordinary road locomotive (*e.g.*, a traction engine), is on the bridge at the time.

Subject to the new regulations, the existing regulations contained in the Motor-Car (Registration and Licensing) Order, 1903, and the Motor Cars (Use and Construction) Order, 1904, will continue to apply as regards all matters not expressly mentioned in the new regulations. The new regulations are, like the previous regulations, made under Section 6 of the Locomotives on Highways Act, 1896, and consequently any breach of them will be punishable by a fine not exceeding £10.

In addition to the foregoing statement of the effect of the new regulations, the Board think it well to add the following observations.

As regards the meaning to be attached to the expression "weight" when applied to a heavy motor-car or trailer unladen, the question has been raised whether a new definition of "weight" should be substituted for that hitherto employed, so as to determine more exactly what separate or detachable parts or fittings may properly be excluded from, or included within, the scope of the above expression. The present definition of "weight," however, follows in its terms the language of Sub-section (2) of Section (1) of the Act of 1896; and the Board have not thought it desirable to depart from that language. All that the sub-section requires is that in calculating the weight of a vehicle unladen, the weight of any water fuel or accumulators used for the purpose of propulsion shall be excluded. The expression "weight" when applied to a motor-car or trailer unladen, therefore, does not in itself determine what can be regarded as part of the vehicle, and what can be regarded as part of the load; and it appears to the Board that whilst any essential part of the vehicle or its mechanism is clearly included in calculating the unladen weight, the circumstances of construction may in certain cases permit of a detachable framework or body being treated as part of the load rather than of the car itself.

The requirement as to the ascertainment of weights, prior to registration, by or in the presence of an officer of the registering authority, is intended to supply an opportunity for testing the accuracy of the facts declared by the owner. The precise steps, however, to be taken by the officer for this purpose are not set forth in the regulations; and, as regards the ascertainment of the axle weights, the officer is not bound to act under the regulations except upon the direction of the registering authority. The necessity for greater or less severity in the tests applied will, of course, in practice depend on whether some limit of weight is approached which has to be regarded for a special purpose, such as load, tyres, or speed. Especial care should be taken in any case where the exact weight would affect a structural detail or a permanent marking on the car. In relation to the acceptance of the declared axle weights, the principal point requiring attention will be that the total of the axle weights fairly represents the joint weight of the car and of the maximum load which it may be expected to carry.

In connection with the provisions of Article XII., it has been suggested that if the officer of a council acts under it and finds that the axle weight for the time being is within the proper limit, the Council should be required to make good and pay for any loss of time occasioned by the action of their officer; but the Board are advised that it is not legally competent to them to include a provision of this nature in the present regulations. This circumstance, amongst others, has led the Board to restrict the operation of the Article to cases where the heavy motor-car is within half-a-mile from an available weighing machine.

It is desirable that the Council should proceed to have the needful forms prepared for the new part of the Motor-Car Register which is to be appropriated for heavy motor-cars. It would be convenient if, before the regulations come into force, the Council sent a notice to the owner of every motor-car already registered with them the weight of which as entered in the Register exceeds two tons. The notice should state that the new regulations apply to all motor-cars exceeding two tons in weight unladen, and that as already mentioned such cars must within six months either be registered anew or must be brought up for inspection and for variation of the registration in compliance with the procedure prescribed by Article IV. of the regulations.

It should be pointed out that if the owner of a heavy car prefers to register anew with another registering authority, notice of cancellation of the existing registration should be sent by him to the Council under Article VI. of the Registation and Licensing Order, 1903. On the expiration of six months after the date of commencement of the Order the registration of any heavy motor-car which was registered before that date, and with respect to which the procedure prescribed by the regulations has not been followed, will cease to have effect, and the entries in respect of that car can be cancelled in the Register.

COLD WEATHER PRECAUTIONS.

By Henry Southeb.

In dealing with the results of my experiments with anti-freezing mixtures and recommendation of alcohol-glycerine, one important fact was omitted, in that I did not state that wood alcohol affected the rubber connections of the cooling system to a very slight degree. One entire season with a 33 per cent. solution affected the rubber so little that after close examination with a knife and by tearing the inner lining of the hose I was not sure that there had been any change. Certainly there was nothing that had affected the hose in any great degree. Glycerine does soften the rubber, but any ordinary hose will stand a year in the presence of it, possibly longer. The glycerine, alcohol and water mixture affects it to a very slight degree in the proportions given in my diagrams published in a recent issue.

The right way to handle the mixture is to find out the equation for your own car, using all the alcohol you can possibly stand and not boil the mixtures on the mild days to be met with in winter in this climate. Some machines will stand all alcohol—that is mixed with water—others will not, and glycerine must be used to keep up the boiling point. Any

Digitized by Google

number of chemical solutions are advertised in the market. It is quite possible that all of them will prevent freezing; I am not able to say to the contrary. One thing must be remembered, however, and that is every salt dissolved in water forms an electrolyte through which electric currents pass with the greatest readiness. Unless the entire system of water-cooling surface is of exactly the same metal, one or the other of the different metals is sure to dissolve. A cooling system may last a year or two, but, sooner or later, the fatal results of electrolysis will be felt and some part of the system will disintegrate. These remarks apply to every chemical soluble in water that can possibly be used to advantage as far as lowering the freezing point is concerned. It is also a not unusual experience to discover that some of the anti-freezing chemicals have left a plaster-like deposit in the bottom of the tanks that finds its way into the pipes or tubes and actually cakes therein.

DRIVER SENT TO PRISON.

William Thomas, who was in the service of Mr. Arthur Kohn, of 79, Queen's Gate, S.W., was summoned, before Mr. Horace Smith, at the Westminster Police Court, on Friday of last week, by Inspector Spencer, L division, for driving a motor-car in a manner dangerous to the public at Westminster Bridge Road. At two o'clock on the morning of the 10th ult., a constable on duty at Lower Marsh, Lambeth, saw a motor-car being driven at a furious rate towards Westminster Bridge. The officer, from the speed, could not take the number or in any way identify it, but at the junction of Lambeth and Westminster Bridge Roads it crashed into some trestles and poles surrounding a large excavation. There were ten warning red lamps around, but these were scattered with the broken woodwork, and the car, jumping a hole 9 ft. long, 4 ft. deep, 4 ft. 6 in. wide, continued its wild career minus the greater part of one of the back wheels. Then the driver managed to get away, at apparently the same rate of speed. A letter from the owner of the vehicle to the police led Inspector Spencer to trace the defendant, and ascertain that he had had the car out, with a party of four, without the knowledge of his employer. The defendant said it was a wet night, and he had on some new skidding tyres from Paris, he having just finished a Continental tour. He could not see very well, because the rain was on the glass panel in front, and there was the glare of an electric car. He saw but one red lamp, and was obliged to go on at the full pace—to have pulled up then would have had still more serious consequences. Inspector Spencer said last June the defendant was convicted of reckless driving at Coventry. Mr. Horace Smith did not regard this as a case for a fine. He ordered the defendant to be imprisoned for two months.

CASE DISMISSED.

Mr. P. P. Prebles, of Russley Park, was summoned at Leicester, on Monday, for driving his motor-car to the danger of the public in that town. Mr. Staplee Firth conducted the defence, and the magistrates dismissed the case.

A SUCCESSFUL APPEAL.

At Folkestone Quarter Sessions on Monday the appeal of Mr. Louis Sinclair, M.P., against his recent conviction for driving a motor-car at a rate exceeding the speed limit was concluded.

The Recorder said that he approached the evidence anxiously and carefully. Having dealt with the evidence for the Crown and the expert evidence for the appellant, he said that the speed evidence of the constable—which was, of course, the principal evidence—was unreliable. Mr. Sinclair, when before the petty justices, did not tender legal evidence, and possibly did not appreciate the gravity of the charge. On the evidence given them, the justices were right in their decision, but on the evidence of the appeal case he could not find Mr. Sinclair guilty of any offence under the Act. The conviction was therefore quashed. No order was made as to costs.

IMPORTS OF AUTOMOBILES.

Below we publish our monthly official list of the imports of motor-cars, motor-cycles, and the parts thereof, into the United Kingdom during the month of November, 1904:—

UNITED STATES.

Shipped from	To	Description.	No.	Value.
Boston	London	Motor-cars	2	£140

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JANUARY 14, 1905. [No. 306.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

AT its meeting in London on Monday the Committee of the Automobile Club passed the following resolutions of protest against the proposal of the Automobile Club de France to run the race for its Grand Prix over the same course and at the same time as the Gordon Bennett event. It resolved, on the motion of Mr. S. F. Edge, "That the principle of another race being run at the same time and over the same course as the Gordon Bennett Race will decrease the interest in the Gordon Bennett Race, and is bad in principle from a competing Club's point of view." It further resolved—"(1) That this Club immediately send to the Automobile Club of France a strong protest against any other race being held on the same road and on the same day as the race for the Gordon Bennett Cup. (2) That a copy of the protest be sent to Mr. Gordon Bennett, and also to all Clubs eligible to compete, together with an invitation to them to send a like protest to the Automobile Club of France."

◆ ◆ ◆

The British Team.

SINCE our last issue the official list of entrants for the honour of representing Great Britain in the Gordon Bennett race has been issued. It is exactly as published in these columns last week, with the exception that the Weir car—to be constructed by the Scotch firm who built the British Darracqs last year—will be driven by Mr. A. L. Guinness. The two Stars will be driven by Messrs. J. Lisle and F. R. Goodwin, the latter thus making his first appearance in an event of such importance as the Eliminating Test.

◆ ◆ ◆

Seaside Race Meetings.

MOTORISTS are apparently regarded by the Corporations of seaside towns as fair game for the summer season, and already meets are being suggested for Hastings, Clacton, Blackpool, Southport, and Brighton, to say nothing of the attractions at Douglas towards the end of May. Of course the municipal authorities of these places are solicitous as to the prosperity of the boarding-houses and the hotel-keepers who are on the rate book, and welcome any scheme likely to attract wealthy visitors, as well as to popularise and advertise their towns. But the motorists should be allowed a word or two before any definite schemes are suggested. Firstly, we would urge that the central authority should withhold support from any of these suggestions until all the likely applications are before it. Corporations wishing to hold such gatherings should submit their claims to consideration by a certain date, after which no new applications should be considered, so far as the present season is concerned. Then the merits of each place might be studied and approval given to events arranged at convenient dates from each other, to avoid the clashing of programmes and the inconvenience of those who may be persuaded to enter. As far as possible each meeting might be given a distinctive character, so that the enthusiasts who ride for the delight of the public might not be provided with a round of sameness such as is often presented to the squirrel when in captivity.

◆ ◆ ◆

Hotel Charges during Race Meetings.

PROVISION having thus been made to prevent overlapping, local promoters should impress upon hotel-keepers the fact that the goose that lays the golden egg has only one life; and that extortionate charges on the two or three days of an automobile race meeting may endanger the reputation of the town with a class of people which hotel proprietors are usually glad to welcome. The motorists should be regarded more in the light of guests, and not pounced upon as victims. Garage accommodation might well be provided by the organisers for the convenience of competitors, so that they should not be left to the mercy of landlords with extravagant notions with regard to the value of services often inadequately rendered. We would even go so far as to say that the tariffs at the leading hotels during the race week should be submitted when inviting motorists to entertain the town and its visitors. They would thus be able to estimate their expenses; and landlords would be made to recognise that a spirit of justice should prevail—even to motorists when on holiday bent.

◆ ◆ ◆

Timing Races.

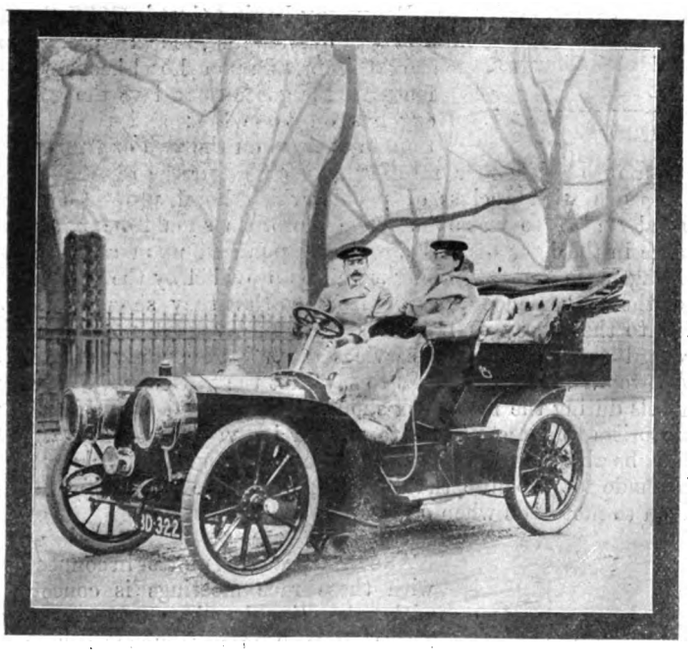
ANOTHER practical matter in connection with these race meetings is concerned with the time-keeping arrangements. These have been a frequent source of discussion among motorists, and at no contest hitherto held in this country have they been entirely satisfactory. The electrical timing device has been both disappointing and expensive, and recourse had had to be made to the stop-watch. In such circumstances no one should be engaged unless he has a chronograph which has recently passed through Kew, and when such appointments are made the equipment of the official in this respect should count quite as much as the person himself.

◆ ◆ ◆

The Value of Prizes.

A FURTHER point we would emphasise has regard to the awards given. The man who has a motor stud valued at many hundreds of pounds does not race for the sake of the diploma or prize; but he does like to feel, should he win a place in a contest, that when he mentions the fact to friends and produces the evidence they will not laugh at the character of the prize. At one of the seaside race meetings the medals were almost as valuable as the tokens that are presented to members of school football teams who show prowess in the game. The event we have in view was successful from the pecuniary and the popular points of view, so that there was no plea of poverty to be raised. Events where gentlemen enter as much to advance the cause as to enjoy themselves should not be made a source of profit to the towns that are supposed to entertain them as guests; hence the plea that before the English

Digitized by Google



racing season of 1905 is planned such matters as those we have raised should be thoroughly discussed, and everything done to secure fair play to every motorist who enters and respectable awards to all who win.

◆ ◆ ◆

Medicos and Motors.

MEDICAL men are becoming increasingly partial to the motor-car. They recognise the saving of time that can be effected by its adoption, and on all hands we hear reports of doctors disposing of their horses and visiting patients by means of the automobile. During last month—the quietest month of the year in many respects—the Mobile Motor and Engineering Company, Limited, of Birmingham, supplied a car to Dr. Underhill, of West Bromwich, and another to Dr. Dewdney, of Kingskerswell. Both gentlemen have sold their horses and are depending entirely on the motor-car to do their work.

◆ ◆ ◆

Mr. and Mrs. Claude Borrett on their 22-23-h.p. Crossley Car.

Mr. Borrett, who is an enthusiastic motorist, has already run his car over 2,000 miles in England, and has just left for Cannes with it. It will be noticed that, although the *chassis* is only of the standard length, it is fitted with a neat side entrance body.

◆ ◆ ◆

Heavy Motor Traffic.

A QUESTION referring to the Local Government Board's order relating to heavy motor traffic, which comes into force on March 1st next, was asked at the meeting of the Paddington Borough Council by General Laurie of the chairman of the Works Committee. The order proposes that heavy motors with a weight of eight tons on each axle shall be permitted to travel at a rate of eight miles per hour in the borough. General Laurie expressed a fear that the Council's roads might be found unsuited to this new traffic. Alderman Whur said the town clerk had only just received a copy of the Local Government Board order, and the borough surveyor had had no opportunity to consider it. He proposed to do so at the earliest possible moment, and to bring up a report. The use of heavy vehicles would of necessity increase the wear of the roads, and some of the roads in the borough were not suitable for heavy traffic. General Laurie said action must be taken before March 1. Alderman Whur promised that all necessary steps to protect the interests of the borough should be taken.

A Lesson for the Police

AT the Clerkenwell Sessions one of the magistrates at the West London Police Court has received a lesson which, it is to be hoped, will not be lost upon him. As recorded on another page, the appeal of a motorist from a decision of Mr. Kennedy has not only been allowed, but costs have been given against the police—a fact even more notable than winning the appeal. The police had a quartette of witnesses, but, despite such an array of evidence, the defence was able to convince the superior Court as to the unfairness of the conviction, and so clearly was this the case that the police were ordered to pay the costs of the appeal. This order should also have included the costs of the defence in August last.

◆ ◆ ◆

Reference Books.

WHITAKER'S ALMANAC for 1905 is before us with its 800 pages of information on nearly every subject that the man of affairs is likely to be interested in. Special attention is given to the movement of British trade in 1904, and a new feature is that dealing with holiday and health resorts from the hygienic point of view—a section in which motorists will have much interest. Reliability is, as usual, the characteristic of Whitaker's Almanack, but the list of places of interest in London might be extended to include the Tate Gallery.—The catalogue of the principal English books in circulation at Mudie's Library is a comprehensive guide to literature, the plan of "subject classification" enabling the leading volumes on any particular topic to be found with ease and rapidity. Only one criticism need be offered, viz., the separation of books on motoring from the volumes on cycling, the recent development of automobilism warranting such a division.—As an annual work of reference the "Daily Mail" Year Book has rapidly come to the front, and the value of the 1905 volume is enhanced by a series of special articles.

◆ ◆ ◆

A Motor Launch Service.

THE first motor launch public service will be inaugurated during the coming summer by Mr. L. W. Iliff, of Birkenhead. He intends to run a motor launch between Beaumaris and Carnarvon, and is undertaking the venture with a spirit and enterprise that we hope will be successful. The present intention is to run six trips a day between the places named, calling at intermediate towns. That the local authorities view the suggestion with some approval is evident from the fact that the Carnarvon Harbour Trust have decided to charge only a nominal sum for the landing and embarking of passengers at their place during the season. This is quite a new development of the automobile industry, and one that should ultimately do something to re-awaken the prosperity of many seaside towns, just as the motor-car movement is doing much to revive fading hopes in some of the smaller towns on the main roads.

◆ ◆ ◆

Motor Boats on the Wye.

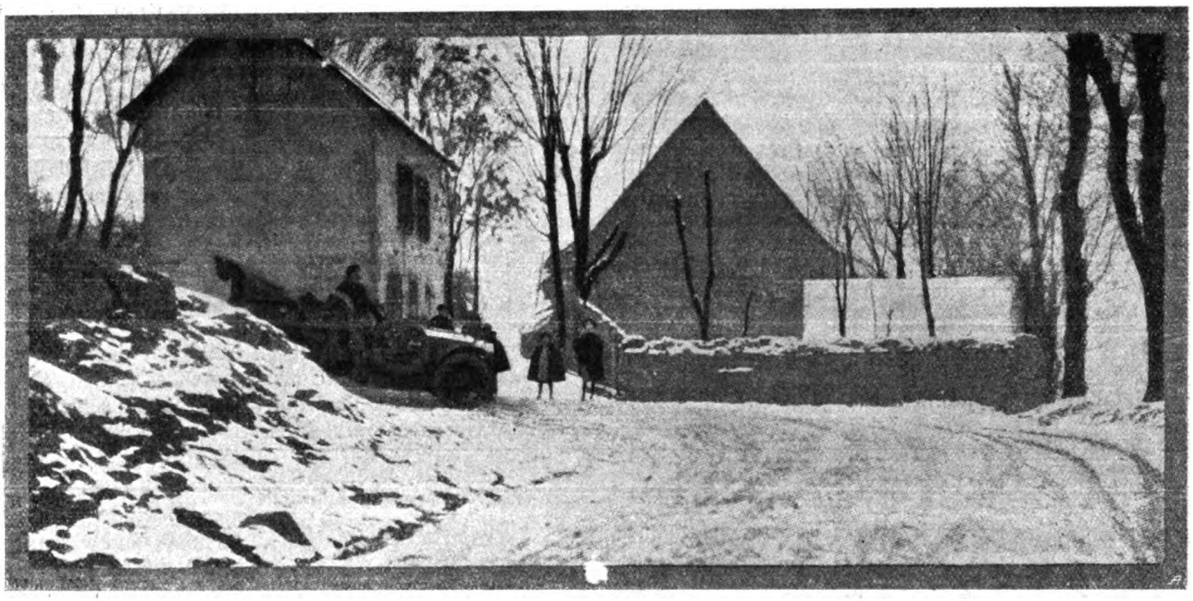
IN addition to the motor launch service in Wales, there is a project afoot for providing a new boat service on the Wye—that delightful river of which those who took part in the trials at Hereford had glimpses, and which has been glorified by Miss Braddon as "the Rhine of England." Mr. C. Curtis suggests that the river should be cleared of the rocks and great stones throughout its sinuous course of ten miles between Hereford and Fownhope. Then a service of motor-boats should be established, which would undoubtedly prove attractive not only to the residents of the district, but also in drawing visitors to the delightful scenery about the banks of the Wye.

Digitized by Google

A Club for Ceylon.

THANKS to the initiation and energy of Mr. Harold North, the well-known planter of Kadugannawa, Ceylon has, as we mentioned in our issue of the 31st ult., a club to safeguard and support the interests of motorists in the Island. At the inaugural meeting Mr. North, the originator of the movement, detailed the various objects of the club. He announced that H.E. the Governor, Sir Henry Blake, G.C.M.G., had consented to be the first patron of the club. Officers and a committee were then elected. General Money, the commander-in-chief of the forces in Ceylon, was elected president, and Mr. L. Creasy, of the Public Works department, vice-president. Mr. North was unanimously elected to fulfil the duties of hon. secretary. The main objects of the club are, firstly, to render the roads safer for motorists, by urging the Government to enforce the law forbidding the trespassing of native-owned cattle on the public highway. At present herds of cattle are allowed to graze uninterruptedly on the edges of the road. The second danger on the road is that of pariah dogs. In every roadside village, and near every roadside habitation, swarms of unfed, hideous, and diseased abominations come flying savagely out at every passing vehicle, and constitute a most serious danger. The animals are for the most part unowned, and it is impossible to find and prosecute the owner, but as motor-cyclists now nearly always carry a small revolver, the numbers of these roadside pests will doubtless diminish considerably in the future.

◆ ◆ ◆



Petrol Facilities.

THE Government has already been approached on the matter of allowing greater facilities for conveying petrol by rail, and has consented, by amending the petrol ordinance, to meet the wishes of the club in a reasonable manner. The club has also considered the best manner of combatting the extremely high rates of petrol and motor accessories. Messrs. Walker, Sons and Company, of Colombo, have agreed to supply members of the club with accessories at 10 per cent. over English retail prices. The greater number of the members are motor-cyclists, but there are at present about thirty cars of all sorts in the island, ranging from a big steam car recently imported in connection with Messrs. Thomas Cook and Son, to the small Oldsmobile runabout. A fair number of Humberettes are running, and also a 6-h.p. Wolseley, only one of which has up to the present been imported. The owner, Lieut. Skelton, R.A.M.C., speaks most highly of its performances over the long and trying gradients of Ceylon roads.

◆ ◆ ◆

Advice to Makers.

MANUFACTURERS and agents should understand clearly that the motor trade in the East is a very important and steadily-growing industry, and they will do well to make strenuous efforts to secure the lion's share from foreign competitors. This they should be able to do, the quality of British made motor-bicycles already imported giving great satisfaction in a country where there are very few facilities outside Colombo for repairs. Against this, however, must be placed the fact that the foreigner realises far better than his English rival that his customers require their orders executed promptly and according to specification. Motorists in Ceylon do not make alterations from standard specification from a spirit of mischief, but because they know the peculiar conditions under which they want their machines to run. Manufacturers should take pains to send out both cars and motor-bicycles amply tyred and with the best possible makes; the climate there is very trying to tyres. For cars particular attention should be paid to the water cooling arrangements, and the radiating surface should be larger, for obvious reasons, than would be necessary for cars intended to be run in a temperate climate. The temperature of Ceylon is high, and the gradients, though seldom stiffer than 1 in 10, are frequently four or five miles long. The main roads are beautifully traced, and the surface, except at the beginning of the road-mending operations, is excellent. Like all roads in mountainous countries, they abound in sharp curves and unexpected corners, careful driving is therefore imperative. The Automobile Club of Ceylon has made a most auspicious start, and it is to be hoped that British manufacturers will take full advantage of the splendid field that is spread out before them. Ceylon is not a country of rich men, and neither roads nor purses out there are suitable for high power or expensive vehicles.

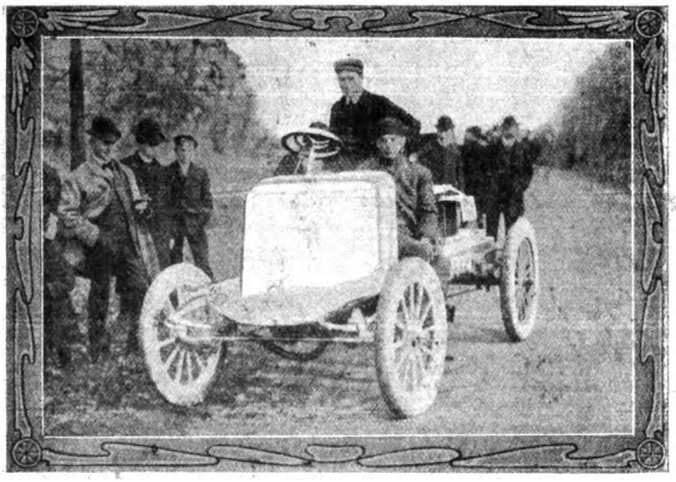
The Gordon Bennett Course under Snow.—A Bad Turn near Rochefort.

◆ ◆ ◆

The 5,000 Miles Trial.

THE 12-h.p. two-cylinder Siddeley car continues its long trial, the variations of weather encountered since the start providing a good test of its capabilities and merits. The distance covered last week was 1,000 miles. On Monday 185 miles were covered on the Coventry road, and on the following

Digitized by Google



day 149 miles were traversed on the Bath road, no involuntary stops and no incidents occurring on either occasion. In fact, the steady running of the vehicle—neither climatic conditions nor varying roads interfering with its progress—must make the journey somewhat monotonous to the Observer of the A.C.G.B.I., who has had practically nothing to record.

◆ ◆ ◆

Licences and Registration.

CONFUSION as to licensing drivers and registering cars seems to exist in some quarters, and an alarmist note has been struck in a contemporary by suggesting the liability to be required to buy "new plates" unless driving licences are promptly renewed. Such a mistake is quite incomprehensible. A licence to drive has to be renewed annually, and is a personal matter entirely. The registration of a car is, as Rudyard Kipling would say, "another story." It is an official recognition of a vehicle and the assignment of a number, which remains in the possession of the owner so long as he retains the car. His licence may expire, but the number of the car remains. A reference to any handbook would have obviated an error which scared at least one motorist into writing to the Press

Centre Tramway Poles.

IT has recently come to the knowledge of the Roads Improvement Association that the Board of Trade have provisionally sanctioned the erection of central poles in connection with the light railway which is being constructed through East Finchley and North End, Finchley. The light railway in question commences near the London County boundary in Archway Road, and runs thence in a north-westerly direction for nearly five miles along the Great North Road. These five miles form part of one of the most important thoroughfares out of London, and the Council of the Association is making representations upon the matter to the Board of Trade. The evidence before the Royal Commission on London Traffic has been overwhelmingly against the erection of central standards on main trunk thoroughfares, and this particular thoroughfare is, without exaggeration, the most important thoroughfare out of London. Practically all the through traffic to that part of the country lying between the London, St. Albans and Birmingham road, and the London, Baldock and Cambridge road, viz., the greater portion of Great Britain, leaves London by this particular road in preference to all others. The experience gained at Ealing and elsewhere shows that the erection of central standards reduces the traffic capacity of a road by about one-third, and greatly multiplies the dangers of accident. The possibilities that a side-slip may result in a disastrous accident are greatly increased by the existence of obstructions in the centre of the highway, and, as is well known, greasy tramlines are a principal cause of side-slip in the case of rubber-tyred vehicles. We understand that the Board of Trade has submitted these representations of the Roads Improvement Association to the local authorities interested for their observations.

◆ ◆ ◆

Motor 'Buses.

THIS is the year of the motor-'bus, so far as London and its suburbs are concerned, and, in addition to the important developments made in connection with the traffic to and from the main streets of the metropolis, the suburbs are being awakened by the advent of the omnibus without horses. In the Woolwich district a company has been formed to run a service of motor-omnibuses between that place and the suburbs beyond. Already the motor vehicle is plying for hire in the main thoroughfares of London, and crowds are gathering at the termini for the chance of a ride. The formation of the London Motor-'Bus Company is a sign of the times.

◆ ◆ ◆

Proposed Highway Legislation.

THE Council of the Roads Improvement Association have under consideration the draft of a Bill which it is proposed to introduce into Parliament at the beginning of next Session. The Bill will give effect to the more important recommendations of the Departmental Committee. In particular, it is designed to create a central department for the purpose of assisting the local highway authorities: to largely increase the highway powers of the county authorities; to provide for the construction of new main roads through and out of the large urban districts; and to protect the interests of the ratepayers by providing that suburban districts shall be laid out according to some definite plan, under which new trunk roads of adequate width shall be built and the existing ones widened before building operations commence, and so render unnecessary costly street widening and improvement schemes. Such reasonable proposals should have practically universal support.

◆ ◆ ◆

Differential Treatment.

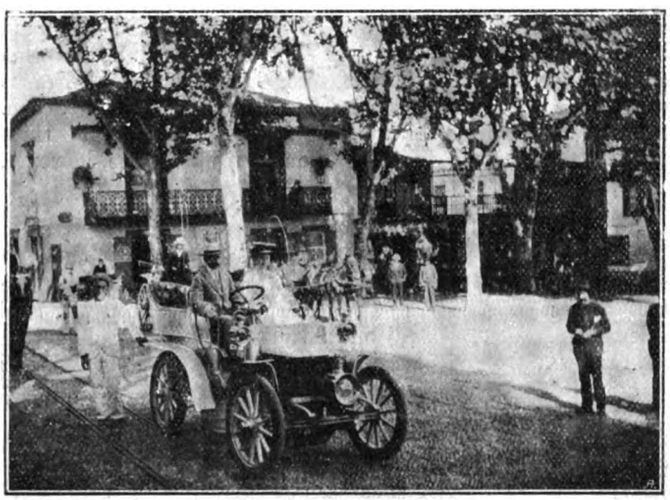
FOR not exhibiting a red tail light on his car, a Rugby motorist has been heavily fined, and a reader, whose letter appears in our correspondence columns, draws attention to the case as another piece of evidence showing the preferential treatment accorded to motor-drivers and horse-drivers. For this offence the motorist was fined £5; had he been driving an ordinary vehicle a nominal sum would doubtless have been imposed. Surely the necessity for equality of fines is becoming increasingly apparent—even to the most convinced anti-motorist.

MESSRS. LINTINE AND CO. have been appointed sole concessionnaires for the "Le Radium" motor lamps.

THE *Motor-Car Journal* is now fully installed in its new offices, 27-33, Charing Cross Road, London, W.C.

THE Birmingham Corporation have placed an order for a Clement-Talbot car with Messrs. Piercy and Co., of Birmingham.

MESSRS. CARLESS, CAPEL, AND LEONARD inform us that they have reduced the price of their standard petrol 1d. per gallon.



A CORRESPONDENT writes us that, in returning to town from a hundred-mile journey, on a muddy day last week, a hansom cab jockeyed the car. On the occasion of one of the numerous stoppages in Piccadilly, the two vehicles were enabled to draw up side by side, when the owner of the car remonstrated with the cabman. Looking down at the muddy passengers, the Jehu ironically remarked, "Now, governor, don't be dirty; don't be dirty!"

THE FIRST MOTOR-CAR IN MADEIRA.

By Harvey Foster.

AFTER deciding to spend the winter at Madeira my thoughts turned towards the cars I was leaving behind, and, speaking to a friend, he suggested taking one with me; but, knowing the bad roads and terrific hills, I hesitated, and after thinking the matter over once more decided to put my faith in a 10-h.p. Wolseley. I ordered a car and arranged for its shipment, also made inquiries regarding petrol, which I found could not be obtained on the island, and was told by the Consul

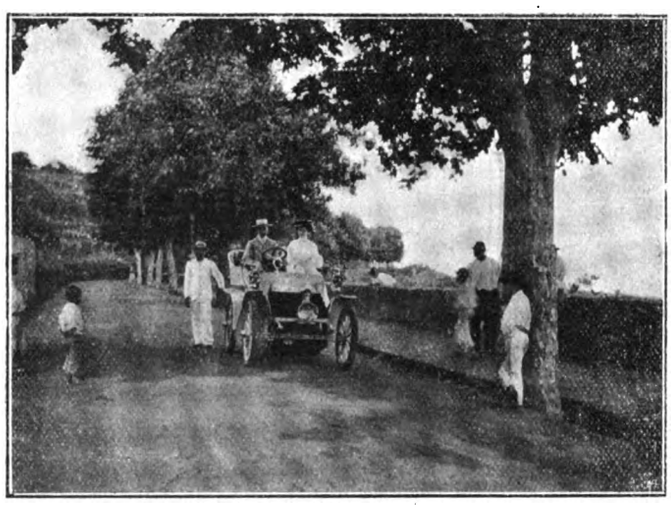
Motoring in Funchal.

there would be some considerable difficulty in passing same through the Customs. At last I succeeded in getting a Lisbon firm to make me a special consignment in a small sailing ship.

Then the difficulty arose as to how to land the car, as the Union Castle Line's ships all stop half a mile out in the bay. My first idea was to drop the car into the sea and tow it to the shore, but after consideration I found this would be impossible, and then arranged for one of Cory's large lighters to take it. Our next difficulty, after getting the lighter pulled up on the beach, was to get the car off. This we eventually did after tremendous labour by erecting a scaffold, which I thought would break every minute.

It was well on to 9 p.m., and, of course, the Customs were closed. I was told there would be a special officer on duty to watch the car all night, for which I had to pay later. Next morning I went down to the Customs about 10, and was met by the kind and courteous Mr. Alfred Reid, who said he would see to all the necessary Customs formalities. After about three hours' delay I was towed in State by two bullocks to the Carmo Hotel yard, where I lubricated and filled up with petrol.

I had taken the precaution to take out a charged accumulator with me, as I was doubtful about having them charged there, but need not have been, as Mr. Beazley, managing director of the Electric Light Works, was kindness itself, and charged my accumulator splendidly. By this time half the population of Madeira were waiting to see the "Land Ship," as they called it. I drove through the town, and up and down the Pontinie two or three times. The engine ran splendidly, and we thought the car fit to tackle one of the worst hills in Madeira, which it did in good style, we arriving at Reid's New Hotel greatly pleased with the car.



The next three days I used the car continually, but on the fourth I received a notice from the Governor of the island to say the car was not to be used again until I had proved to his satisfaction that the vehicle was quite safe to be at large, and that I was a competent person to drive same. I immediately went to my friend Mr. Reid, who said he had no doubt he could help me out of the difficulty. After two days' delay, two men who had never seen a motor-car before came to examine it and make sure it was not an infernal machine. The examination lasted an hour. Then I took them a run to prove I was competent to drive, and on their return they assured me through the interpreter that I should have the necessary permission to drive anywhere on the island. In about a month's time I received a formidable bundle of papers which they had specially printed, as mine was the first car on the island, and my number was "1." Amongst the papers was a special permission from His Majesty the King of Portugal, also a passport for my wife and family. What the passport had to do with the car I never could find out.

The roads in Madeira are the worst I have ever driven on: in fact, they are beyond description. They are all paved with what I call inverted petrified kidneys, as will be seen by the photograph; the steepest hills have the same paving, only in the form of steps. They are, of course, made in this style to suit the curious mode of locomotion on the island, namely, sleighs (carros) drawn by bullocks. There is one exception, namely, the New Road to Camera de Lobos. This is a small fishing village about five miles from Madeira, where you can get a good spin and a small stretch of top speed. I think I am right when I say there are only about half a dozen wheeled vehicles on the island. The natives (I mean the adults) did not pay the slighest attention to the motor. I am told it is a curious trait in their character that nothing surprises them. The children are worse than any I have ever come across. They several times absolutely walked right into the car, and it is the greatest wonder I never had a bad accident. The only one I had was running over a pet dog belonging to the matron of the Seamen's Hospital. The following morning an amusing little rhyme appeared in the paper as follows:—

"Here lies poor J., whose soul is departed;
"He went for a walk and got motor carted."

I may say all my doings were chronicled in the papers.

I saw several well-known motorists whilst in Madeira Messrs. S. F. Edge, Andrew Fletcher and A. Beuer. The two latter I had the pleasure of giving several rides to, and they were both surprised the way the Wolseley took the hills. I

The New Road to Camera de Lobos.

ascended what the inhabitants assure me is the steepest hill in Madeira, namely, the hill from the Pontinie to Cassino. I must say the car never failed me during the whole of the six months, except once when I ran out of petrol. The non-skid tyres stood marvellously, never having one puncture over the most awful roads I should think a motor has ever travelled on; in fact, taking everything into consideration, I think the motor-car has once more proved its superiority over every other means of locomotion, and since returning I hear from friends at Madeira that there are several cars on order for the island, but I cannot recommend the roads or the hills to motorists in general.

THE "AMAC" WATER-CIRCULATING PUMP.

THE new water-circulating pump for petrol cars known as the "Amac" has recently been introduced by the Aston Motor Accessories Company, Limited. Probably, excepting ignition apparatus, none of the auxiliary mechanisms necessary to the modern car give more trouble and annoyance than the pump. It is apparently a small detail, yet, should it become deranged, the engine stops, and the owner is fortunate if nothing more serious than a temporary "panne" results. The pump, which is made in accordance with Mr. F. C. Haste's patent,

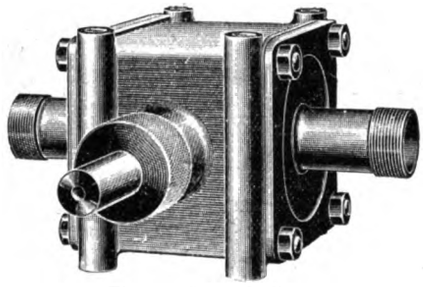

Fig. 1.—General View.

is claimed to possess all the advantages of the rotary and centrifugal types, with the defects of neither. It can be run at a great range of speeds and gives a steady discharge at relatively low speeds. It can be driven in any convenient way, either "rotary" by chain or belt, or "reciprocating" coupled to some convenient part of the motor. The mechanism is entirely enclosed in a grit-proof case specially designed to enable constructors to fit the pump in the most convenient place on any motor or frame. The bearings are large and are made on the interchangeable system. The valve is made of "Dermatine," a special material of great wearing capacity,

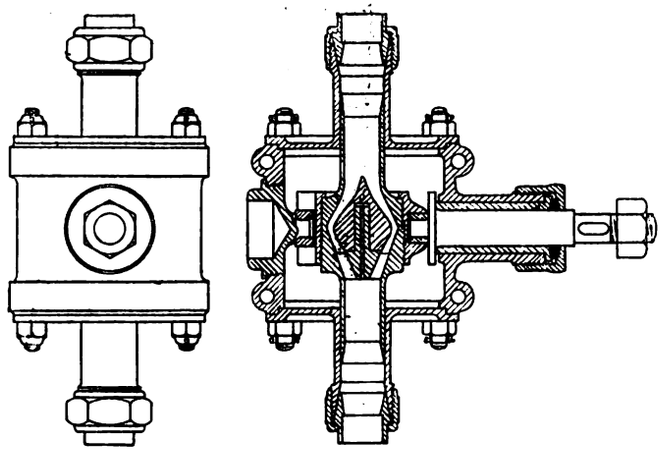

Fig. 2.—End and Sectional Views.

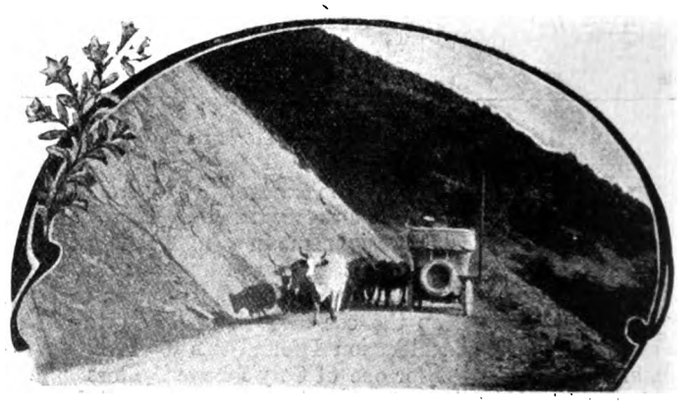
unaffected by either oil or heat. One of the great advantages of the centrifugal type of pump lies in the fact that it is not liable to clog, nor to internal damage owing to the presence of grit in the circulating water, an advantage equally shared by the "Amac" pump. Should a temporary block occur the pump immediately becomes positive, and removes the obstruction. At ordinary speeds and under normal conditions, the discharge of this pump presents all the desirable characteristics of a centrifugal pump. The apparatus is very compact, the case measuring only 3 3-16 inch by 3 3-8 inch by 3¾ inch.

THE ALUMINIUM CASTINGS COMPANY, of Greenock, report considerable activity in their department for motor-car castings.

CONTINENTAL NOTES.



The Gordon Bennett and A.C.F. Grand Prix Race.

The decision of the French Automobile Club to organise a race for its Grand Prix in conjunction with the 1905 Gordon Bennett race is still the chief subject of conversation in motoring circles, and is affording subject matter for column after column of "copy" in the French automobile Press. Notwithstanding this, no very definite change in the position has taken place during the week. The challenge of the Belgian Club for the Gordon Bennett Cup has not been accepted by the A.C.F., as it was made with the provision that the two races should be held on different days. As regards Italy, the Fiat Co. has announced that it will take part in both the Gordon Bennett and the Grand Prix. There is some talk of making the latter an invitation race, limited to forty-two competitors. It is said that France would be allotted fifteen places, England and Germany six each, and America, Belgium, Switzerland, Italy, and Austria three each. No definite announcement on the matter has, however, yet been made by the A.C.F.

◆ ◆ ◆

Some French Views.

M. Paul Meyan, of "La France Automobile," endorses the action of the A.C.F., and considers that there will be no more risk of accident than there was in Ireland or Germany. M. Paul Sencier, of "L'Automobile," on the other hand, considers that the A.C.F. will probably discover that the old adage of "there's

A Continental Touring Experience.

many a slip between the cup and the lip" is a true one, and that it is improbable foreign countries will agree to an alteration in the rules of the Gordon Bennett race merely to meet the wishes of France.

◆ ◆ ◆

The French Eliminating Trials.

Doubts are being expressed as to whether the Government will give its permission for the races to be held on the Circuit d'Auvergne; and as, owing to its hilly nature and sharp turns, the competing cars will have to be of special design, more than one firm is delaying work on its racers until definite information on the point is available. The steam racers which the Serpollet Co. are building for the eliminating contest will, it is announced, have a relatively short wheel base in order to enable them to take the sharp turns on the Circuit with safety. The generator will be located in the front end of the *chassis*, and the engine under the driver's seat, It is stated that Messrs. Turcat-Mery and Co. will not take part in the eliminating trial, it having being arranged for the De Dietrich Co. to enter three cars on the Turcat-Mery licence. The probable drivers of these will be Gabriel, Rougier, and Duray. Messrs. Alexander Burton, Salleron and Leger are named as the drivers of the three Mors cars.

◆ ◆ ◆

The German Team.

THE German eliminating contest is to be held on a 50 kilometre circuit in Schleswig-Holstein, the start taking place

Digitized by Google

at Lubscher Brunnen, near Itzehoe, between Hamburg and Kiel. Herr Opel has written to the German Club, protesting against its action in allotting two places in the German team for the Cup race to the makers of the Mercedes cars, and only allowing one place to be competed for.

Motor-Boat Racing at Monaco.

A record entry has been received for the motor-boat races which will be held at Monaco from the 9th to the 16th April next. In all 103 vessels have been entered; these comprise thirty-nine racers, fifty-one cruisers, three yachts, six canoes, and four fishing vessels. A very large number of special boats are being built for the meeting, and, as compared with last year, a great increase in engine power is taking place, several being arranged for motors of 200-h.p.

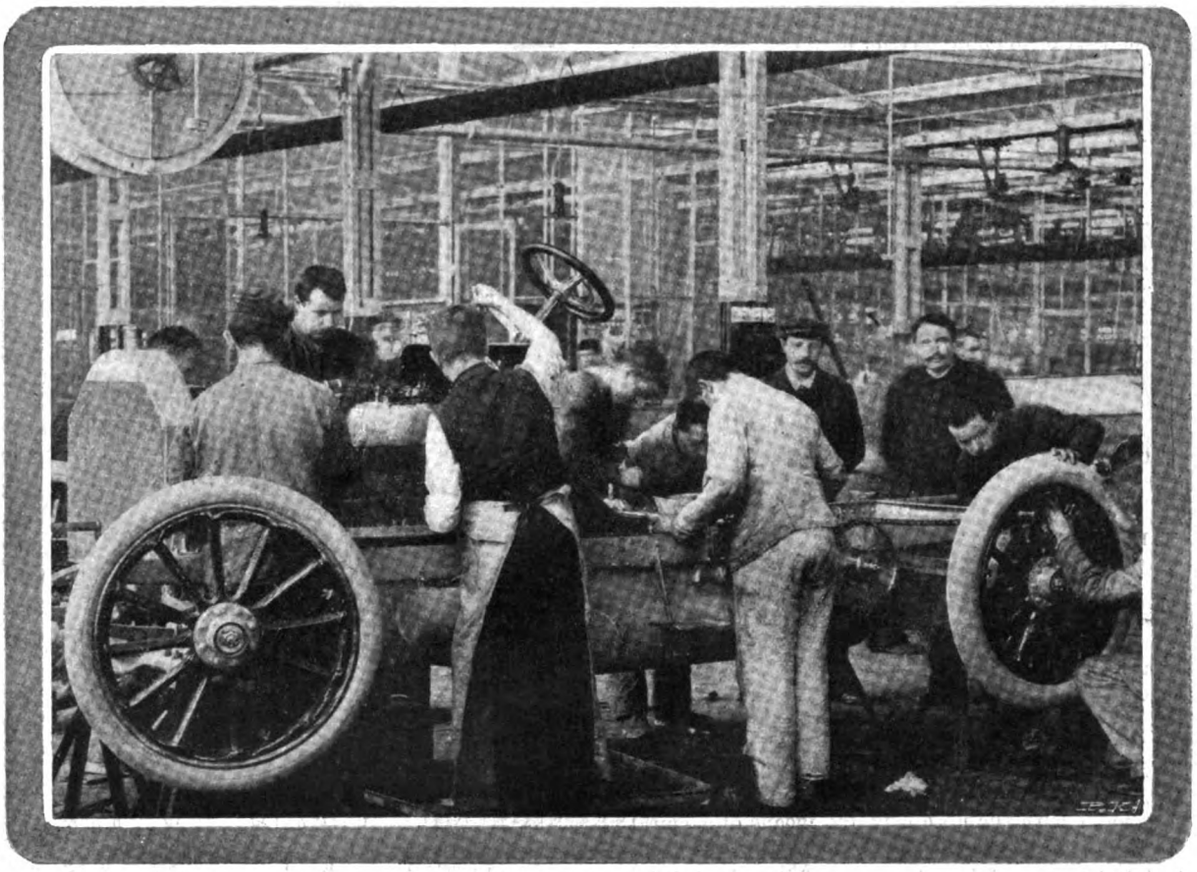
The Cannes Automobile Fete.

The Cannes Automobile Club is organising an automobile fete to extend from the 11th to the 25th February next. The programme will include a touring competition on the Esterel Hill; a consumption trial, a paper chase, and a flower fete.

Public Services in Germany.

Quite a number of projects for the establishment of public motor-car services in Germany are at present under consideration. Among them may be mentioned one between Einbeck and Vorwohle, one between Schwenningen and Donauschingen, and one between Nordhorn and Freren. A service has also just been started between Wolfenbuttel and Semmenstedt.

A German Motor Volunteer Corps.



The formation of a German volunteer automobile corps on the lines of that in England is now assured, and the important question of the uniform for the members has been settled. Baron von Brandensteim, of the German Automobile Club, was commanded to appear at the royal palace last week wearing the new uniform for the Kaiser's inspection. His Majesty suggested several improvements, and, on understanding these would be introduced, expressed his approval of the effect produced. Members of the corps will be armed with a navy revolver and a big deer knife.

Motor Mail Vans in Russia.

Following the example set by the postal authorities in St. Petersburg, motor mail vans are now being adopted in Odessa. One van has already been put in service, and two others are to be started at an early date.

The Northern Games in Stockholm.

Four years have gone by since the great sporting feasts under the above title took place in Stockholm, and still the memory lives with those who came from far and near to partake in the proceedings of those memorable eight February days during which the competitions were held. The games were popular because of the many different events which constituted the programme and for the excellent achievements which the several matches and competitions occasioned. For the 1905 meeting, which will be held from February 4th to 12th, an excellent programme has been drawn up, this including skating, skate sailing, ice yacht sailing, hockey, curling, ski running, etc., while an innovation consists of a series of motor-car races on short straight courses on the ice at Stora Vartan.

Building a Mercedes Car.

[*Allgemeine Auton.-Zeitung.*

BRIGHTON is evidently preparing for a busy season, for not only is a large motor garage being erected at the back of the Grand Hotel by the Brighton and Sussex Motor Company, but rumour has it that the proprietor of the Royal York Hotel, in conjunction with a Long Acre firm, also proposes erecting another large garage.

D

MOTOR CYCLING NEWS.

THE Auto-cycle Club de France has decided to organise another motor-cycle reliability contest in 1905, on the lines of that held last year between Paris and Bordeaux. The date of the contest and the course over which it will be held have not yet been decided.

THE "Provence Sportive" of Marseilles has offered a challenge cup for an international motor-bicycle touring competition. The rules for the trial have not yet been issued, but the event will probably be held in May next, and be over a distance of 300 kilometres.

THE two-seated motor-tandem introduced by the Rover Cycle Company, Limited, has already been briefly alluded to in these columns. The machine, however, comprises a number of special features, of which a more lengthy description may be of interest. The motive power is supplied by a 4-h.p. engine water-cooled on the thermo-syphon system, no pump being used, a combined water-tank and radiator being mounted in front of the steering column. The usual form of high-tension ignition by coil and accumulators is provided, while the mixture is furnished by a "Rover" carburettor. From the engine the

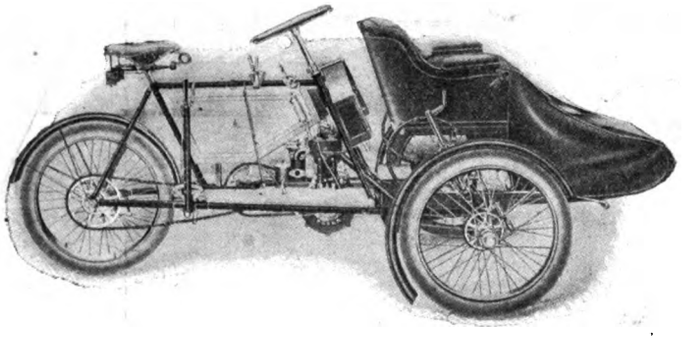

Fig 1.—The Rover 4-h.p.-Tri-Car.

power is conveyed through a friction clutch and chain to a small gear-box, giving two speeds, and thence by a second chain to the rear road wheel. A sectional view of the clutch, which is mounted on the engine shaft, is given in Fig. 2. An outer member 4 is carried on a ball-bearing on one end of the crank shaft 2; to this is fixed a chain pinion-wheel 7 for transmitting the power to the gear-box. The outer member contains a fibre friction ring 5. A conical disc 12 is arranged to slide on a squared portion of the crank shaft and is normally forced into engagement with the fibre ring by means of a spiral spring 13, thus coupling the chain wheel to the crank shaft. On the outer side of the crank shaft bearing 3 is a square thread fitting a corresponding thread in the boss of a lever 15; a ball-thrust-bearing is arranged between the boss of this lever and the inner face of the conical disc. When it is desired to disconnect the engine from the machine, or *vice versa*, the lever is partially revolved on the square thread by means of a hand or a foot lever, thus forcing the cone, against the pressure of the spring, out of engagement with the fibre of the ring. By this arrangement an efficient clutch devoid of all end thrust and friction when driving, and which runs freely on ball bearings when out of action, is obtained. Detail drawings of the Rover two-speed gear are given in Figs. 3 and 4. The gear is contained in an oil-tight case 1, arranged between the engine and the rear road wheel; it consists of a shaft 2, to one end of which is keyed a chain sprocket 3, which is connected by a roller chain to the engine clutch. In the centre of the shaft is a squared portion on which is mounted a sliding double claw clutch 4. At one end of the squared part of the shaft is a small spur gear 5, and at the other end the larger spur gear 6, both of which are capable of revolving independently of the shaft, but, by means of the claw clutch, either can be locked to the shaft when desired. At the rear of the shaft and parallel with it is another shaft 7, with the spur gears 8 and 9 cut on the ends, and in mesh with the spur gears previously mentioned. The spur gear 6 has an extended boss projecting through the case on the side opposite to the chain sprocket 3, and on this boss is secured the chain pinion 10, which

transmits power to the road wheel. The two shafts are carried on ball bearings, and the sliding clutch 4 is operated by a slipper 11 and forked lever 12, carried on the rocking shaft 13, which can be moved by a lever 14 fixed on its outer end; this lever being coupled by a rod to a hand lever on the top tube of the machine. When the clutch 4 is in engagement with the low gear 5, the motion of the square shaft 2 is transmitted to the chain pinion 10 through the reducing gear on the back shaft 7,

whilst, if the clutch is in engagement with the high gear 6, it locks the chain pinion to the square shaft and gives a direct drive for the high gear. The machine is steered by means of an inclined hand wheel as on a car, while both hand and foot controlled brakes are provided. Two comfortable rubber-covered footboards, brought well back to facilitate mounting, are provided for the rear rider. The extreme length of the machine is 8 ft. 9 in., and the width 3 ft. 9½ in.

THE PARIS MOTOR-CAR EXHIBITION.—v.

IN concluding our report of the Paris *Salon*, it may be of interest to give a few extracts from some useful statistics compiled by M. Lucien Perissé for "L'Auto." We therefore append a table showing the percentage of petrol cars on view ranged in order of horse-power.

6-h.p. ..	3 per cent.	20-h.p. ..	11·2 per cent.
7-8-h.p. ..	8·5 per cent.	24-25-h.p. ..	15 per cent.
9-10-h.p. ..	9·9 per cent.	28-30-h.p. ..	4 per cent.
11-12-h.p. ..	12·2 per cent.	35-h.p. ..	2 per cent.
14-16 h.p. ..	22 per cent.	40-50-h.p. ..	4·7 per cent.
17-18-h.p. ..	7·5 per cent.		

From the above it will be observed that French manufacturers are paying relatively little attention to the demand for cars for the man of moderate means, the most popular type being that with engines of 14 to 16-h.p. Cars of from 24 to 25-h.p. are next in popularity, followed by those of 11 to 12-h.p. M. Perissé emphasises the reduced attention motor-car builders in France are devoting to the popular priced vehicle by showing that whilst at the 1903 *Salon* cars of from 6 to 8-h.p. represented 17 per cent. of the total, at the show just closed the percentage was only 11½.

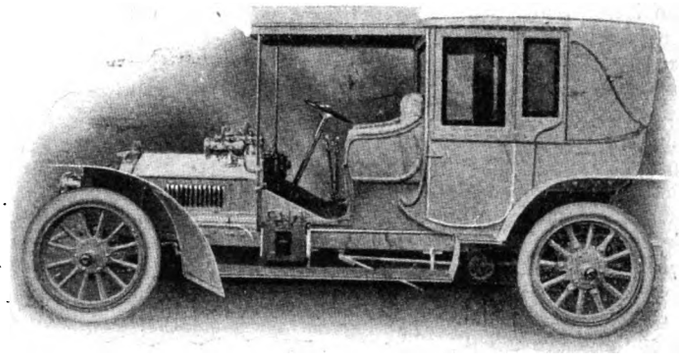

Fig. 70.—A Benz 35-40-h.p. Landaulet.

The ADER COMPANY had a very interesting display of cars, the larger models of which are fitted with vertical engines having four separate cylinders. The inlet valves are mechanically actuated off their own cam shaft. An automatic air-regulating carburettor is provided. The transmission is by cardan shaft and live axle, the latter being entirely enclosed and transmitting the power to the road wheels at the ends. Pressed steel frames, magneto and accumulator ignition, clutch pedal acting on the throttle are other features of the 1905 Ader cars.

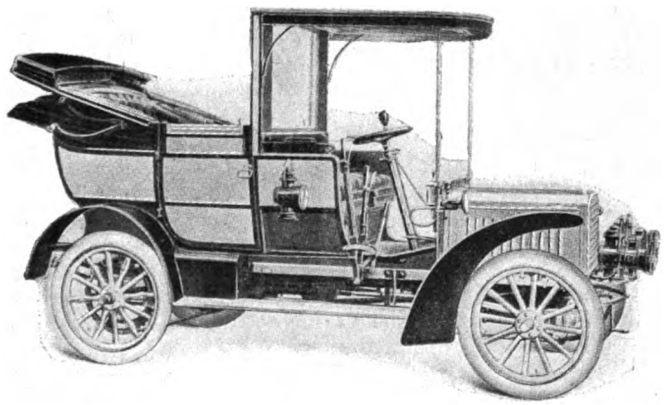

Fig. 71.—The Ader 12-16-h.p. Four-Cylinder Landaulet.

In the exhibit of the SOCIETE CLEMENT interest was chiefly centred in the 16-20-h.p. car, which comprises many new and distinct features. The *chassis* is narrowed in front, allowing a large "lock" for the steering wheels. The motor has the four cylinders cast separately, enabling the crank shaft to have five different bearings. The cylinders are 95 mm. bore by 130 mm. stroke, the normal speed being 1,000 revolutions per minute. The valves are mechanically operated, and distributed on opposite sides of the motor, the valve chambers being completely encircled by water. The ignition is by high-tension magneto driven off the right-hand cam shaft by spur gear enclosed in a small aluminium case. The change-speed gear is similar to last year's except that the Mercedes type of ball bearing is used in place of the ordinary brasses. Transmission is by means of cardan shaft, the live axle being so constructed that three different ratios of crown and bevel wheels can be fitted, enabling the owner to have one ratio of gear for hilly work and one for very fast work over level ground. The differential pinions are of the straight tooth type, instead of the bevel pinions formerly used. The control levers are mounted on the top of the steering wheel, the wire cables connected with the throttle and ignition being carried through the centre of the steering column. In addition to the above-mentioned, 10-12-h.p. and 12-14-h.p. cars were also shown. The former has a two-cylinder engine, 88 mm. bore by 140 mm. stroke, the general details being similar to the 1904 model. The 24-30-h.p. car has a four-cylinder engine, the cylinders (105 mm. by 140 mm.) being cast separately, as in the

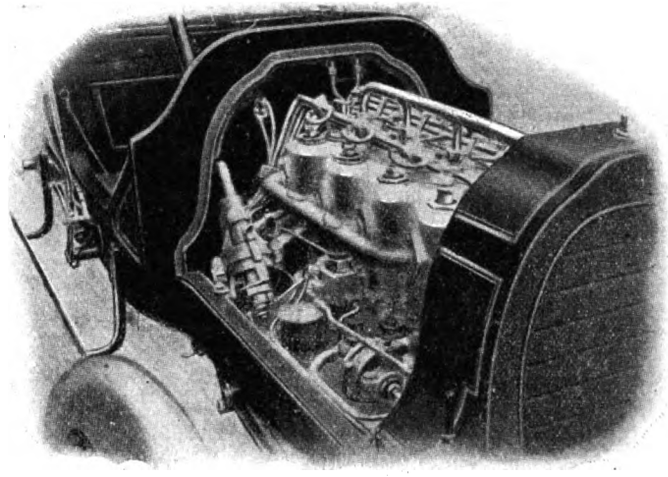

Fig. 72.—The Ader New Vertical Four-Cylinder Engine.

16-20-h.p. model. The transmission is, however, by means of side chains, instead of cardan shaft as in the other three models. The differential casing is quite independent of the gear-box, a strong shaft transmitting the power from the latter to the countershaft, enabling the gear-box to be placed under the front foot-boards, where it is easily accessible, while the differential box is under the floor-boards of the tonneau. The *chassis* of the two larger models are sufficiently long to receive side entrance bodies, of which some excellent specimens were on view.

M. BERLIET, of Lyons, is making for the 1905 season four standard types of four-cylinder cars—14-h.p., 22-h.p., 40-h.p., and 60-h.p. In each a pressed-steel frame is employed, narrowed at the forward end to give the front wheels as full a "lock" as possible. The cylinders are cast in pairs; the inlet valves are mechanically actuated, and are interchangeable with the exhaust valves, the two cam shafts with the cams being enclosed in the crank case. The centrifugal governor is adapted to act on the inlet. The water circulation is maintained by pump and a combined tubular radiator and tank. One of the special features of the Berliet cars is the clutch. The flywheel of the engine is provided with vanes, which serve to induce a strong current of air through the water cooler; the centre of the flywheel is made in the form of a hollow boss, inside which is a metallic segment connected with the gear-shaft, which may be expanded or contracted as desired by the clutch pedal. The clutch, which works in oil,

Digitized by Google

is claimed to work progressively, and without any jerky action. Four speeds forward and a reverse are provided, the transmission of the power from the gear-box to the rear road wheels being by side chains. All the speeds are controlled by one lever, and on the fourth the power is transmitted directly from the engine to the differential shaft. The latter is provided with two band-brakes. The road wheels and the shafts in the gear-box run on ball-bearings. Some excellent specimens of complete cars were shown on the stand, a side entrance coupé-Limousine being particularly noteworthy. We may add that the Berliet cars, which are very much on Mercedes lines, are being introduced into this country by Messrs. Watson and Company, of Liverpool.

A new automatic carburettor which is just now attracting considerable attention in France is that which has been introduced by La Société Force Motrice Economique, of Neuilly sur-Marne. The carburettor consists of a large upright cylindrical chamber, A, provided at its lower end with a float chamber, D, of very restricted dimensions. The interior tube, B, is surmounted by an air inlet chamber, C, which is closed when the device is not in operation by means of a valve, c c, which is normally held to its seat by a fairly stiff spring. Within the float chamber, D, is arranged an annular metal float of substantially the same specific gravity as the liquid, which is guided at its centre by a standpipe depending from the cone F. The

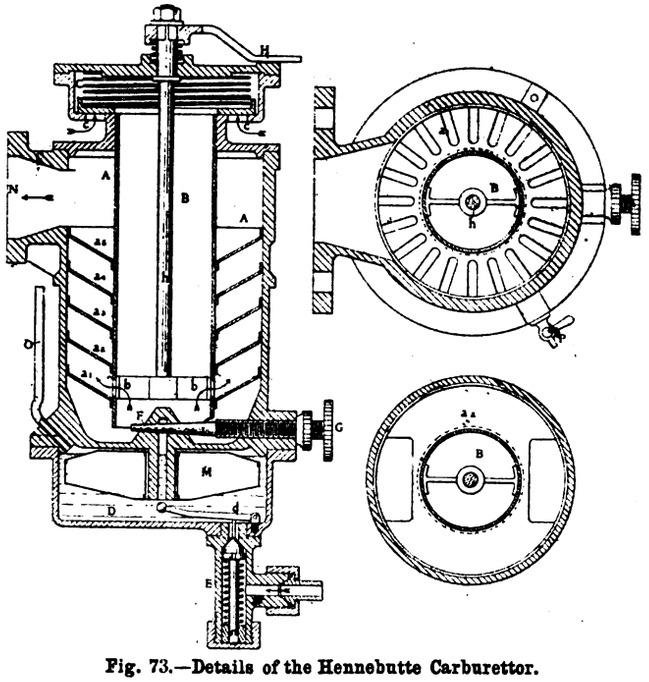

Fig. 73.—Details of the Hennebutte Carburettor.

latter is pierced by a horizontal, slightly flaring passage, cutting at right angles the standpipe depending into the float chamber. A needle valve, G, called the petrol adjusting valve, is arranged in the horizontal passage and is adjusted according to the feed of liquid desired. The petrol arrives from the tank, located at some distance above the carburettor, through the tube, E. Its entrance into the float chamber is controlled by an inverted, spring-pressed, conical valve. Every time that the level of the liquid in the float chamber is lowered, owing to the suction of the motor, the annular float, M, becomes immersed to a lower depth, and bears on the small lever, d, which in turn forces the petrol valve from its seat. There is some difference in the action of the annular float, M, as compared with the usual carburettor float, as the float M is hardly ever fully supported by the weight of the liquid it displaces, and begins to act only when its unsupported weight overcomes the pressure of the spring surrounding the petrol valve. It is claimed that owing to this arrangement the height of the fuel level in the float chamber is less affected by the vibration of the vehicle than in other carburettors. The petrol drawn through the horizontal passage cutting the standpipe flows through the orifices of this passage to ooze in a thin sheet against the wall of the cone, F, where it is vaporised instantly under the influence of the slightest vacuum. At each suction stroke of the motor, the valve, c, is raised from its seat, and air is drawn into the chamber, C, and descends vertically to the bottom of the interior tube, B, rising again through the tube, A, to the outlet orifice, N, after having passed through a zone of petrol vapour, and having become saturated with it, and having also undergone a "brewing" process, which intimately mixes the combustible and the air. The means by which this "brewing" process is effected are as follows:—Outside the tube, B, are superposed five inclined discs (truncated cones), a_1, a_2, a_3, a_4, a_5, which divide the annular space between the inner and outer tubes into six chambers, communicating freely with each other. Three of these discs are provided with radial slots, while the discs a_2 and a_4 are provided simply with two large openings each. The result is that when the air, saturated more or less evenly with hydrocarbon vapour, passes through the slotted discs, it is cut up into thin streams, which are forced to combine again in two large streams in order to pass the two discs with only two openings each, a_2 and a_4. The whole mass of the mixture is thus divided and again united three times in succession, which insures a perfectly homogeneous product. A supplementary air valve, bb, controlled by a handle H, secured to it through the rod, h, allows of admitting additional air between the two lower discs, and thus varying the richness of the mixture at will. The tube, O, is a vent pipe for the float chamber. Aside from the question of homogeneousness, the constancy of proportions of the mixture generated in the carburettor, independent of differences in the speed of the motor, is due to three distinct causes, as follow:—(1) The air inlet valve, by regulating the suction, prevents jerks; (2) the petrol when it rises in the stand pipe is forced to abruptly change its direction in order to pass through the two branches of the horizontal passage; (3) if it is drawn with great force, a shock is produced within the cone, F, which reduces the speed at which the fuel is discharged from the horizontal passage, according to the intensity of the shock. Under these conditions, variations in the speed of the motor do not appreciably affect the feed of the spirit. Finally, it appears that by reason of the interior arrangement, the air where it penetrates to the base of the carburettor by the tube, B, also plays the part of a regulator, in so far as a vertical current of air strikes the discharge orifices of the cone, F, with more or less force, and consequently obstructs more or less the emission of the petrol in proportion to its speed.

At the stand of La Societe des Moteurs and Automobiles Herald, of Levallois-Perret, we met M. Dubois, whose agility with a small Decauville car in the first 1,000-Miles Trials will long be remembered. The *piece de resistance* at the Herald stand was a 24-h.p. *chassis*, the frame of which is of stamped steel. The motor comprises four cylinders cast in two pairs. The inlet valves are actuated mechanically off their own cam shaft. The carburettor is provided with a device by means of which the supply of air is automatically regulated. The vehicle is chain driven and has four speeds forward and a reverse, the change speed gear running on ball bearings. The Herald Co. also showed a 10-h.p. two-cylinder, 14-h.p. and 18-h.p. four-cylinder cars, the latter being fitted with an engine having separate cylinders, and of course, mechanically-operated inlet valves.

The Germain Co., represented in England by Mr. Theo. Masui, inform us that as a result of the satisfaction with separate steel cylinders for the engine, these are being retained. The cylinder heads are of cast-iron, while the water jackets are of brass. Three models are being made—16-h.p., 24-h.p., 35-h.p.—each with four-cylinder engine. Improvements have been effected in the water-cooling arrangements. At the slow speed at which the Germain engine is occasionally run it was found that sometimes the current of air induced by the flywheel fan was not sufficient. The flywheel is therefore no longer made to act as an air inducer, a special belt-driven fan being now utilised.

Digitized by Google

The position of the pump has also been altered, it being now at the rear of the engine under the bonnet, and driven by friction off the flywheel. The carburettor is equipped with a jacket through which hot water can be circulated, means being provided for controlling the circulation. While still using the combined wood and steel frame, arrangements have now been made to supply *chassis* with one-piece pressed steel frames where desired. The inlet valves are provided with a device controlled by a pedal, by means of which the lift of the same can be varied, and consequently the speed of the motor regulated. Both battery and Eisemann high-tension magneto are fitted, one advance and retard lever controlling both systems. The change-speed gear is placed well back, this and the differential being enclosed in the same box. We noticed that the radius rods are now formed of heavily flanged plate bolted to a disc.

La Societe des Automobile Aries, represented in this country by the Anglian Motor Co., had on view four types of cars—12-h.p. double-cylinder, and 15-h.p., 22-h.p., and 30-h.p. four-cylinder; the engines have separate cylinders, while a feature of the vehicles is the special type of double rear axle adopted. The road wheels are carried on a fixed axle mounted below the live axle, the latter transmitting its power through its ends to a jaw clutch formed in the hubs of the road wheels. The Aries Company also displayed a handsome coupé limousine built for M. Tampier, the well-known A.C.F. timekeeper, the interior of the vehicle being so arranged that it can be used as a sleeping compartment.

An exceedingly novel car was to be seen at the stand of M. Rene Legros, of Fécamp, this being fitted with a three-cylinder engine working on the two-cycle system, in which an explosion takes place in each cylinder at each revolution of the crank shaft. In this class of engine the crank chamber is usually employed as a receptacle for the incoming charge. M. Legros, however, uses a very long hollow piston surrounding a smaller fixed piston. There is a separate carburettor to each cylinder. In place of a central connecting-rod two are furnished, one on either side, thereby allowing for the fixed piston.

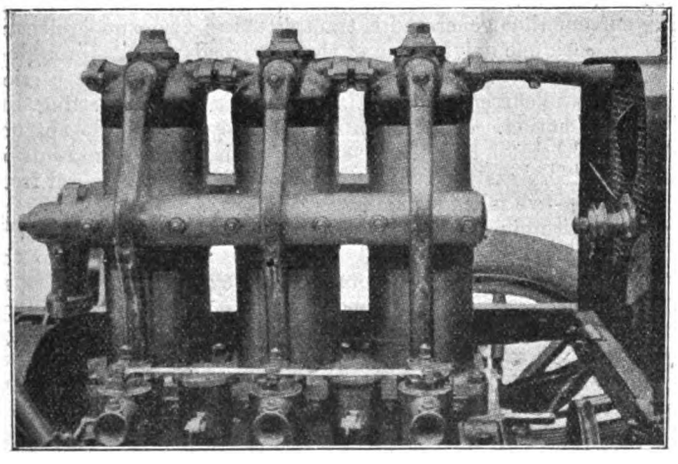

Fig. 74.—The Legros Three-Cylinder Two-Cycle Engine.

A charge of explosive mixture is drawn in within its cavity, and upon the descent of the piston during the firing stroke this charge is delivered through hollow guides and a non-return valve to the induction pipe, and into the cylinder through the usual automatic valve. On the compression stroke the hollow piston is again charging itself with mixture from the carburettor, and upon the explosion stroke a fresh charge enters at the top of the cylinder, chasing out the burnt products at two ports in the lower end of the cylinder walls, uncovered by the travel of the piston towards the end of its stroke. A universal joint of novel design is also found on the Legros car. The device is employed on the cardan shaft as an auxiliary type. The shaft is made triangular in place of circular at that portion where the joint occurs. The wider cone that meets it is likewise triangular a stout washer of specially prepared rubber about two inches thick by three in width, and of similar shape, being inserted tightly between the opposing faces of metal. The result is that when the twisting strain is brought to bear, to communicate the power to the road wheels, the resilience of the rubber softens the initial shock.

Practically the first stand one ran against on entering the *Salon* was that of the Clement-Bayard firm, where a large range of the cars known in this country was the Talbot were to be seen. A noticeable feature of the new models is the abolition of the

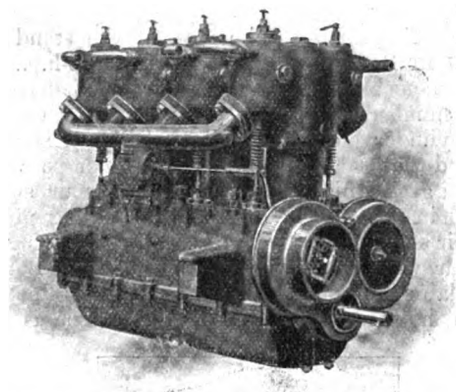

Fig. 75.—The New Aster 20-22-h.p. Four-Cylinder Engine.

automatic governor, the speed of the engine being controlled by a pedal-operated throttle and a device working in conjunction with the clutch pedal, whereby when the clutch is withdrawn the speed of the motor is also cut down. We first inspected the new 10-12-h.p. car; this has a pressed steel frame and a double-cylinder engine, 106 mm. bore by 120 mm. stroke. The valves are all mechanically-actuated and interchangeable. The water circulation is maintained by a pump gear driven off the half-speed shaft, and a honeycomb radiator with fan. For the ignition a new type of high-tension magneto working with ordinary sparking plugs is being employed. The ignition is controlled by a small lever on the inclined steering wheel. The power is transmitted through a leather-faced cone clutch to a gear-box, giving three speeds and a reverse, with direct drive on the top speed. A cardan shaft and bevel gear connect the gear-box with the rear live axle. The brakes are of the internal expanding type, and entirely protected from dust and mud. A comfortable form of body for four passengers is provided, the rear tonneau being detachable. The 12-16-h.p. car has a four-cylinder engine, the cylinders being separate and each 85 mm. bore by 120 mm. stroke. The general arrangement is similar to the 10-12-h.p. vehicle, but four speeds are provided, and the *chassis* is of such a length as to allow of a very roomy side-entrance body to be fitted. Two new models with side chain transmission were to be seen in 24-30-h.p. and 35-50-h.p. cars, the engine of the latter having four cylinders, 120 mm. bore by 140 mm. stroke. Four speeds and a reverse are provided by a gear of the sliding pinion type. For the man of moderate means an 8-9-h.p. car, with detachable tonneau body, has been introduced. This has a pressed steel frame, and a double-cylinder engine 85 mm. bore by 100 mm. stroke. The ignition is by high-tension magneto as on the larger cars, and the water-cooling and controlling arrangements are on similar lines. This is a very attractive model, and should become a popular type in the 1905 season.

A new combination petrol-electric car was to be seen at the stand of the Etablissements Sage, but owing to its position in a side gallery did not attract the attention it deserved. In general arrangement the vehicle follows the usual lines of cardan-shaft driven vehicles, the motive power being furnished by an 18-22-h.p. four-cylinder engine. Two dynamos arranged to act as motors when necessary are provided in place of the usual

Digitized by Google

change-speed gear box, the connections being such that the car is electrically driven at slow speeds only. On the top speed the power is transmitted directly from the petrol engine to the rear road wheels with an efficiency, it is claimed, of 88 per cent. The car, which has been built to the designs of M. Gasnier, was recently submitted to a 7,000 kilometre trial in France, which was accomplished without trouble of any kind.

A name well known in the early days of the industry was revived by the exhibit of Messrs. F. ROSSEL AND COMPANY, of Sochaux (Doubs), who displayed two types of four-cylinder cars, respectively 22 26-h.p. and 28-35-h.p. Of the latter a handsome side-entrance limousine, built for Mr. F. B. Jameson, of Dublin, was shown.

An interesting car was to be seen at the stand of Messrs. CORNILLEAU ET SAINTE-BEUVE. It is of 16-h.p., and, while following the general design of cardan shaft driven vehicles, comprises a number of special features. One of these is found in the four-cylinder engine, the inlet valve cam shaft of which is so arranged that the lift of the valves can be varied. The change speed gear, which is adapted to give four speeds and a reverse, is claimed to be "fool-proof," the sliding pinions being loose on their shaft when the clutch is out, no driving being done until the gear wheels are half-way into mesh. Both magneto and accumulator ignition are advanced by the same lever on a quadrant on the steering wheel. The live axle is enclosed in

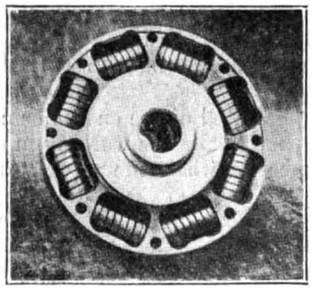

Fig. 76.—The Cornilleau-Ste. Beuve Spring Differential Gear.

the tubular casing carrying the weight of the car, the power being transmitted to the road wheels at the outer ends. The differential gear is made to give a spring drive, a set of eight spiral springs being arranged inside the drum between the actual differential and the bevel driving pinions. These springs are tested to support 1,760 lbs. before being compressed, and as the effort of the engine on the differential is stated not to exceed 132 lbs., it follows that there is always a margin of resilience even when starting under the heaviest load. In fact, the engine makes half a turn before the springs are compressed sufficiently to give a positive drive.

MESSRS. COTTEREAU AND CO., of Dijon, represented in England by Messrs. McNeil, Hutchison and Co., had an extensive display of cars fitted with one, two, three and four cylinder engines, each of which comprise a number of new features. The 7-8-h.p. single-cylinder car has a tubular frame. Three speeds and reverse are provided, transmission being by a single chain to the rear live axle. The motor has mechanical valves, and is governed on the inlet. An 8-h.p. double-cylinder car was also shown, this having side chain transmission. Much interest was shown in the *chassis* of the 15-18-h.p. three-cylinder car, which has a gear-box running on ball bearings, pressed steel frame, and rear internal metal brakes. The 20-24-h.p. car was also well worthy of close examination; it possesses all the features of modern vehicles, and not only in design, but in workmanship, is entitled to rank among the high-grade productions of France.

LES AUTOMOBILES "LA MAGNETIC," of Levallois-Perret, exhibited an 18-20-h.p. car, which was interesting on account of the novel change-speed gear system adopted. In this the various pairs of pinions are always in mesh. Connected with each of the spur wheels on the primary shaft in the gear-box is a magnetic clutch, so that by sending a current of electricity through the corresponding clutch the power may be transmitted through any one pair of the change-gear pinions. The ordinary clutch is dispensed with, as is also the usual change-speed lever.

When we visited the stand of MESSRS. MARTINI AND CO., of Frauenfeld, Switzerland, the new models had not put in an appearance. They turned up later, however, and we find that for the 1905 season the Martini cars are to be made in three sizes—16-20-h.p., 18-22-h.p., and 30-40-h.p. All are fitted with four-cylinder engines, the 18-20-h.p. having cylinders 100 mm. stroke by 130 mm. bore, the dimensions of the 30–40-h.p. motor being 125 mm. and 140 mm. The water circulation is maintained by a gear-driven pump and a honeycomb radiator with fan. The carburettor has been improved, the jet being mounted on a conically-seated plug, held in position by a spring underneath the mixing chamber in such a way that it can be quickly removed for cleaning purposes. A useful fitting in the form of a lever, easily operated from the driver's seat, is also provided to entirely shut off the petrol supply to the jet, when coasting down long hills, enabling a considerable economy of petrol to be effected. The change-speed gear, the bevel drive to the countershaft, and the differential on the latter, are all enclosed within one case. A long shaft fitted with a universal joint transmits the power of the engine through the clutch to the gear-box. Four speeds and a reverse are provided, the two shafts in the gear-box being now in the same horizontal plane. The countershaft runs on four sets of ball bearings, the outer pair being close to the chain wheels, in order to obviate any danger of the shaft springing owing to the pull of the chains. A pawl and ratchet arrangement on the rear chain wheels serves the purpose of a sprag; it is controlled by means of a small lever near the driver's seat. The countershaft brake is pedal-operated and water-cooled; the hub brakes are of the metal-to-metal expanding type.

The KRIEGER COMPANY, which has for some time past been at work on a combination petrol-electric car, exhibited a *chassis* of this type which attracted much attention. Outwardly it closely resembles a petrol car; a 20-25-h.p. Richard-Brasier four-cylinder petrol motor, with magneto ignition, supplying the motive power, is connected up through a spring joint to a dynamo, the armature of which forms the flywheel of the engine. The current thus generated is transmitted to two small electric motors, each one driving one of the rear road wheels through a pinion and internally-toothed ring. A small battery is carried to supply the current for exciting the dynamo and setting the engine in motion. No differential is employed, while the absence of the usual clutch and change-speed gear is claimed to result in a exceedingly easy and quiet-running vehicle, at any speed from six to forty-five miles per hour.

The exhibit of MESSRS. LOUET AND BADIN, of Paris, is always an interesting one, and this year was no exception to the rule. Claiming to be pioneers in three-cylinder engines, they have now introduced a six-cylinder motor said to develop 70-h.p. Perhaps the most noteworthy feature of the cars is the change-speed gear, in which, instead of the pinions sliding sideways into mesh with those on the parallel shaft, they are brought into engagement directly upon the face of the teeth. The *chassis* of this vehicle has a length of no less than 16 ft. The transmission is of the cardan shaft and live axle type, the connection between the two being through a worm gear very much on the lines of that adopted in the Dennis cars.

Of anti-skid devices the number on view was legion, and we have only space to mention a few of them. The PARSONS COMPANY showed their well-known chain device. LES USINES DURANDAL, of Lécluse (Nord), displayed the Durandal non-skid covers and garters. M. LEMPEREUR, represented in England by Messrs. Mann and Overtons, kept his band well to the front. Messrs. BILLET, COUVERCHEL AND CO. were present with the "Billet" anti-skid cover, which is handled in this country by the Civil Service Motor and Cycle Agency, Ltd. M. FORNIER displayed the "De Fornier" detachable band, which is being put on the English market by Mr. Wm. J. Mayer. The OTTO-BENNETT COMPANY also endeavoured to make their band as familiar to French motorists as it is to those in this country.

HERE AND THERE.

A SCHOOL for motor-car drivers and mechanicians is about to be started in Tunis.

AN Austrian society for the abatement of the dust nuisance has just been organised in Vienna.

An Argyll 20-h.p. Saloon among the Welsh Hills.

THE BRISTOL WAGON AND CARRIAGE WORKS COMPANY, LIMITED, have a garage at Victoria-street, Bristol, where they also act as local agents for the Clement-Talbot, the Darracq, the De Dion, and the Wolseley cars.

THE LACRE MOTOR CAR COMPANY, LIMITED, have been appointed sole concessionnaires for England and Wales for the Albion Motor Car Company, Limited.

THE BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, LIMITED, inform us that they have been appointed wholesale factors and distributors of the well-known Spyker cars in England, Scotland, and Ireland.

THE BALCOMBE MOTOR COMPANY, 12, Balcombe Street, Marylebone, N.W., have been appointed by the Eclipse Machine Company, Limited, of Oldham, as their sole agents for the London district for the "Rothwell" cars.

MESSRS. H. M. HOBSON, LIMITED, ask us to remind readers that the genuine "Pognon" plug has the name printed on the top porcelain with the word "exporta" underneath, and in addition to this each plug bears the manufacturer's number.

MESSRS. J. HENDERSON AND CO., the Glasgow coach-builders, more than trebled their output in motor-car bodies last year. Another Glasgow firm, Messrs. J. Buchanan and Co., have also experienced great activity in the same line.

THE WHITLOCK AUTOMOBILE COMPANY, LIMITED, has been registered with a capital of £10,000, to carry on the business of motor-car manufacturers, etc. The first directors are Messrs. T. P. Bryant, W. R. Arnold, S. D. Begbie, and H. M. Simmons.

THE French Customs officials at Halluin, in the Nord Department, are reported to have captured a motor-car containing about 4 cwt. of smuggled tobacco. The movements of the car had for several days attracted the attention of the Customs officials, trips being made across the Belgian frontier and back.

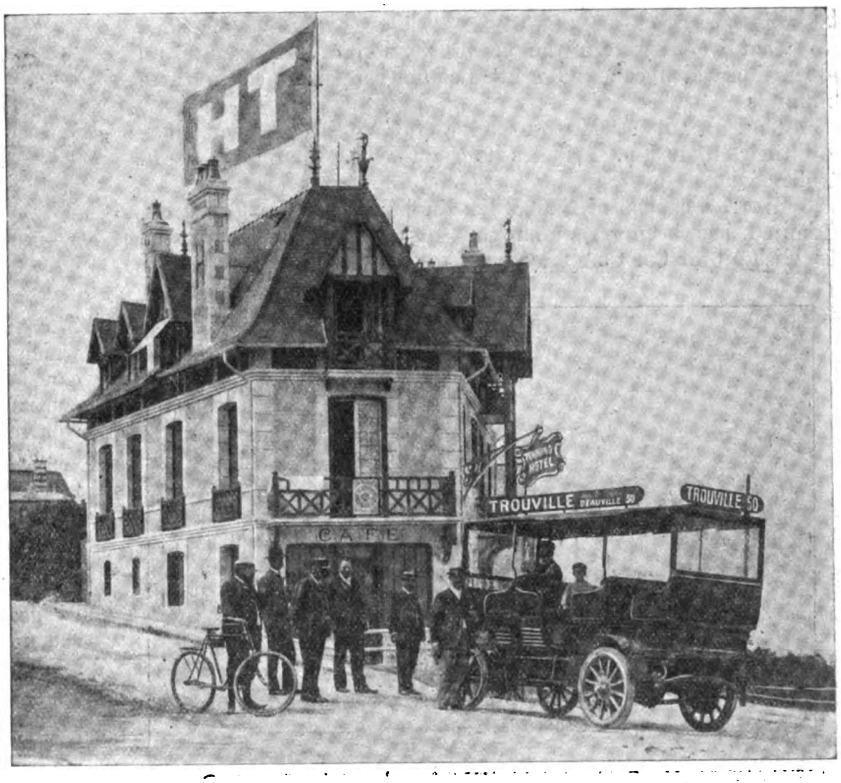
FROM the Eclipse Machine Company, Limited, Oldham, comes a catalogue of the "Rothwell" motor-cars, which are being made with engines of 6 and 12-h.p. The company are also building a neat 12-h.p. delivery van, fitted with solid rubber tyres and designed to carry a load of from 8 to 10 cwts. at speeds up to twenty miles per hour.

IT is announced that an automobile tournament will be held in Havana, Cuba, beginning on the 4th prox.

MR. W. FLINT is opening a garage and motor repair shop at North Hanover Street, Edinburgh.

A PUBLIC service of Serpollet steam cars is about to be started between Nice, La Turbie and Mentone.

MR. HERBERT SMITH, 9, Strand, W.C., will be pleased to arrange trial runs on the Rexette for residents in the London district interested in the vehicle.



CAPTAIN MASUI has done something to further the development of motor-'bus traffic in London, the Germain 'bus which he supplied to one of the omnibus companies having been very successful on its trial runs.

THE Essex County Council have had to make a special allowance to their chief surveyor to meet expenses incurred in connection with extra work caused by the operation of the Motor Car Act.

A MEETING of the Automobile and Cycle Engineers' Institute is to be held at the Acorn Hotel, Temple Street, Birmingham, on the 19th inst., when a discussion will take place on the subjects of four-cylinder motor-bicycles, new electric plating machine, carburettors and silencers.

WE understand that Mr. C. H. Schofield, who has been for the past two years closely allied with Mr. D. M. Weigel in the building up of the reputation of the Talbot car, has resigned his position with Clement-Talbot, Limited, and is seeking fresh fields for his energies.

"THE Sussex County Handbook" is the latest addition to the list of useful county works of reference. It comes from the office of the "West Sussex Gazette," and evidently much care has been taken in its compilation.

A De Dion Public-Service Vehicle at Trouville.

THE owner of a 16-h.p. car has covered on an average 500 miles per week through all sorts of weather and over all kinds of roads with a pair of Palmer cord ribbed tyres on the driving wheels. They gave every satisfaction, covering 11,000 miles, only puncturing three times. They will stand good for a few thousand miles yet before being retreaded.

THE other week, in our report of the Paris *Salon*, we briefly referred to the novel detachable *chassis* exhibited by La Societe Luc Court and Co., of Lyons. We are now able to give two illustrations of the system, which shows that not only does the ability to detach the *chassis* into two parts facilitate repairs but it enables a motorist to utilise his engine and transmission

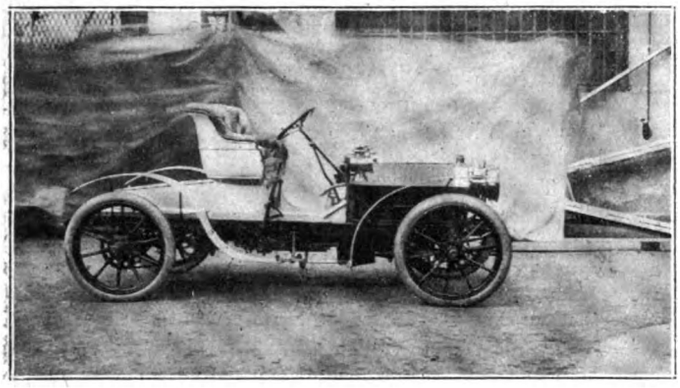

Fig. 1.—The Luc-Court Vehicle as a Two-Seater.

mechanism with two or more different types of carriage bodies with varying wheel-bases and sprockets. The front wheels, steering gear, motor and gear-box are all mounted on a separate frame, the car body, rear wheels and axle and the differential shaft being supported on another frame. In Fig. 1 the vehicle is shown as a two-seater with a wheel base of 7 ft. 8 in. and sprockets giving a top speed of 44 miles per hour. In Fig. 2 the rear part of the car has been detached, the spare one—a coupe limousine for winter use, with a wheel base of 9 ft. and sprockets to give 34 miles per hour—brought into position ready to be attached to what we may term the power portion of the *chassis*, an operation which can, the makers claim, be performed in three minutes.

THE BEAUFORT MOTOR COMPANY have just delivered one of their 15-19-h.p. Princess four-cylinder phaetons to Lord Tollemache.

WITH a capital of £5,000, the English Motor Car Company, Limited, has been registered to acquire the business of the English Motor Car Company, carried on at Hanover Court, W.

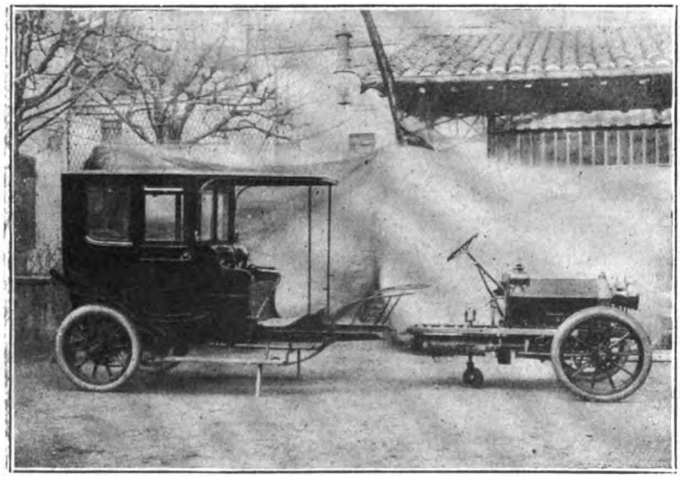

Fig. 2.—The Luc-Court Vehicle in Course of Transformation to a Coupe-Limousine.

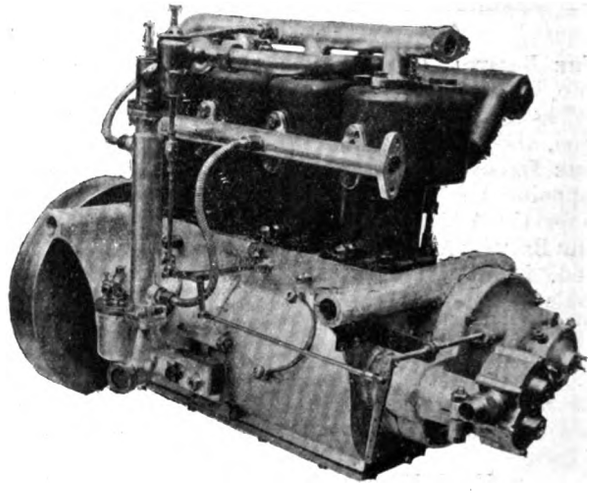
MESSRS. FULLER, MACLEOD AND CO., LIMITED, have removed their offices to Norfolk House, Laurence Pountney Hill, E.C., and their stores to 115, Cannon Street, E.C. The firm will henceforth devote special attention to Hellesen's dry cells and electric ignition apparatus for motor-cars.

MR. D. DOYLE has removed to Nelson House, 9, Charing Cross Road. London, W.C.



VISCOUNT HAMPDEN has lately acquired a 16–20-h.p. J.P. car from the Britannia Motor Garage, Limited.

ON Saturday the King and Queen had a motor-car trip from Chatsworth to Buxton, and on Sunday Her Majesty the Queen enjoyed a run by automobile through some of the scenery of the Peak.

OWING to increased business in motor tanks, radiators, etc., Messrs. C. Harlow and Co. have removed to larger premises in Hillsboro' Road, Hillsboro', Sheffield, where additional plant has been laid down.

THE American Postal Progress League has suggested the installation by the U.S. Postal Department of automobile travelling post offices, in which the mail could be assorted while the car is travelling, and collections and deliveries made with greater celerity.

WE illustrate herewith the 18-20-h.p. motor lately introduced by the Forman Motor Company, Limited, Coventry; it has been designed with a view to supplying the demand for an up-to-date model of four-cylinder engine, fitted with mechanically operated valves, perfectly balanced, elastic, and moderate in price. It consists of four separate cylinders, 94 mm. bore by 110 mm. stroke, mounted upon a special base-chamber. It is fitted with a solid four-throw crank, with ample bearing surfaces.

The whole of the cam gearing is enclosed in oil-tight cases, which are readily opened out for inspection, and the camshaft can be removed complete with the least possible work. The centrifugal governor, which acts upon the incoming charge, is so arranged that it can be set to act at any desired speed, while the engine is so elastic that the makers claim that it is capable of running at any speed from 100 to 2,500 revolutions per minute; this is obtained by a special automatic carburettor. Further, a "snifting" valve is provided, so that when the engine is cutting out the cylinders are drawing in cold air. The engine is also fitted with a water-circulating pump, driven direct by gear wheels from the crankshaft; it is held by a socket in the crank case, and is easily accessible, the unfastening of a set-pin being all that is required to detach it.

THE MAIDENHEAD MOTOR MANUFACTURING COMPANY have opened a garage at 122, High Street, Maidenhead, where they have every facility for the execution of repairs, the storage of petrol, oils, etc. Being open day and night, this new garage should be a great convenience to motorists in the Thames Valley.

FROM the De Dion-Bouton Company, of Puteaux, France, comes a copy of the pamphlet they have just issued descriptive of M. Cormier's recent 8,000-kilometre tour on a De Dion 15-h.p. four-cylinder car. Reproductions of a number of snapshots taken in the various countries passed through add greatly to the interest of the work.

CORRESPONDENCE

[*Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.*]

THE USE OF THE ACCELERATOR.—HAND *v.* FOOT CONTROL.

To the Editor of *The Motor-Car Journal.*

Sir,—I have been very interested indeed in the controversy regarding Mr. Percy Richardson's article on the above subject, especially as some time ago this gentleman showed me the "Brotherhood" car confidentially, and this was one of the points that particularly struck me at the time as being a distinct improvement on the usual type of control as fitted to modern motor-cars. I have now been an enthusiastic motorist for over five years, during which time I have owned and driven Benz, Mors, Daimler, Renault and Panhard cars, whilst I have studied all other makes very closely at every opportunity. In the ordinary car, when one wants to pull up quickly, it seems necessary that some arrangement should be made to leave the hands free to manipulate the steering, horn, and side brakes without also having to throttle the engine. On one of my cars the levers for these were not arranged at all well; but in the Panhard which I am now driving the control is very much more to hand, as I can keep a good hold of the steering wheel whilst throttling and altering the spark, which I find is a very great improvement, and I think an arrangement as explained by Mr. Richardson will be a great help in driving, particularly in London.

In the Panhard car, the foot accelerator may be used in a somewhat similar manner; but as this is liable to be moved owing to the vibration of the car over rough roads, and is actuated by the same foot as the brake, it is, I should say, not so convenient or practical as the one fitted in the manner suggested. I have now had experience of the usual types of foot accelerators which are so arranged as to prevent a fine variation in engine speed, and even this variation is seriously affected when travelling over a rough road, owing to the varying pressure of the foot on the pedal. One of the chief advantages, I think, in the "Brotherhood" control is that the foot lever is arranged to get over these well-known difficulties, as it enables the finest possible variation of engine speed, without in any way being affected by foot pressure. In many cars, owners have fitted a second horn to be used by the passenger beside them, and I venture to think that at times the driver's hands are too full.

Judging by my own experience, I can quite appreciate Mr. Richardson's statement that he finds the "Brotherhood" method of control enables a driver to take a far greater advantage of the elasticity of the engine, and as I understand the ideal motor-car is one that can be driven at any degree of speed from zero to maximum, either by means of the flexibility of the engine or the gear, I must say that I think the control mentioned by that gentleman in his article is a decided step in the right direction for the attainment of this end. As regards Mr. Maudsley Brooke's ideal control, I cannot think that motorists who have had any experience with modern four-cylinder cars fitted with an effective automatic carburettor can agree with this. My own experience has shown me that a governor is rather a detriment if one wishes to take full advantage of the elasticity of the engine, and I am now contemplating taking off the governor of my car, and replacing this with a throttle I am having made, which will, I think, enable me to get much smoother running results with a greater range of speed.—Yours truly,

W. J. Peall.

To the Editor of *The Motor-Car Journal.*

Sir,—Your correspondent "Tally Ho" is very much to the point in his remarks about mistaking the pedals. A driver who could mistake his pedals after learning to drive is surely a danger to us all. At the same time, I think everything possible should be done to render the mistake difficult, and the best method of doing this is to have push pedals for clutch and brake and a press pedal for the accelerator. There appears to be a general inclination amongst your correspondents towards fitting both foot and hand control, and this undoubtedly is the correct and most convenient form under existing conditions of car construction.

As embodying in a simple and practical form all the best points mentioned in this correspondence, may I mention the car which I have driven all last year. I refer to the Darracq. In the 1905 type there is a centrifugal governor, the action of which can be modified to any extent by a press-down pedal to the right of the brake pedal. Both clutch and brake being push-pedals, it is very difficult to confuse them with the press-down accelerator pedal. The movements of pressing to sprint and pushing to retard are both automatic and positive, and the difference between them removes all inclination to press accelerator and push clutch at the same time. The hand control on the wheel acts in conjunction with the pedal to this extent, that to whatever speed the hand lever is set, the engine speed will not fall below that speed, as the effect of the hand lever on the throttle gives a positive minimum, and after a sprint with the pedal the speed will again fall to that minimum when the pedal is released; the minimum, of course, being determined by the position of the hand lever.

For open country work the hand lever is perfection, while in traffic it may be set to give a minimum speed of about five miles per hour, and all variations given by the foot control, which can be operated as sweetly as the throttle of a steam car almost. The advantages are felt particularly in changing speed. In going from second to top the hand lever can be set to the position which gives, say, fifteen miles per hour on the top, the engine raced with the pedal to get the car going well, and when the clutch is pulled out the foot pedal is simultaneously released, and on slipping the top speed in the engine will be going at the correct pace.

I think it would be difficult to imagine a simpler or more convenient control than I have found this to be. It is certainly far and away ahead of anything I have driven yet. The possibility of mistaking the pedals has been a serious drawback in some of the cars I have seen where the usual arrangement of placing them has been altered to suit the passing fancy of the builder, but it is merely a bogey in a properly designed car, and should not be reckoned at all in discussing the question of hand *v.* foot control.—Yours truly,

Donald Straker.

To the Editor of *The Motor-Car Journal.*

Sir,—This discussion is most interesting. There is no system but what has its drawbacks. One has to choose that one that has least. I prefer to have both foot and hand control. At present my favourite car is a 10-h.p. Motobloc, originally fitted with foot accelerator only. I have adjusted the governor to cut down the speed of the engine to the slowest it will run at when free. I have since added a hand control on steering pillar, which enables me to run the car at any rate of speed, leaving the foot control to accelerate independently. When coming into traffic, or bad roads, the hand control is thrown out of action altogether, and the speed regulated by the foot control alone, and so when coming to a state of rest in traffic or anywhere the engine immediately drops to its governed speed, and does not race. I cannot understand anyone making a mistake between brake and accelerator pedals, and anyone that could lose his nerve as Mr. Priest suggests should never drive. A driver should not require to use his eyes to look for the position of his levers. He should be able to manipulate each, including the change-speed lever, without looking at it. What about night-driving if one cannot do this? It is perfectly easy to control the accelerator or anything from the clutch pedal, but it, of course, necessitates further complications and their not infrequent adjustment. I prefer my clutch pedal to be free, and have disconnected it, even from my side brakes, as I find it an advantage at times on greasy roads to have my side brakes slightly on; moreover, for starting on a hill it is safer to have side brakes and clutch to act independently.—Yours truly,

Leonard Baynes.

To the Editor of *The Motor-Car Journal.*

Sir,—With regard to the correspondence taking place in your *Journal re* the Foot *v.* Hand Control, I think for all-round purposes that the combination of both the foot accelerator and the hand control lever on the steering wheel is the most satisfactory, but where there is only one system fitted I think it is far better to fit the foot accelerator than to depend only on the hand control lever, as one would be always taking their hand off the steering wheel to work the throttle; and it is not safe to depend only on your left hand to steer a car at times. On the 7-h.p. Little Star, which is considered to be one of the easiest cars to handle, the foot accelerator only is fitted, with very good results, but on all the larger Star cars a combination of the foot and the hand is fitted, and this I consider by far the best system.—Yours truly,

J. Lisle.

To the Editor of *The Motor-Car Journal.*

Sir,—I notice that the opinions of your several correspondents as to foot or hand control are far from unanimous. It has been the fashion, up to now, for the majority of the leading makes to fit a foot accelerator, but, from practical experience with both, give me the hand control. It is a very common occurrence for even expert drivers to use the accelerator pedal instead of the brake for the moment, and I have been repeatedly told of such occurrences, and the consequent narrow shaves.

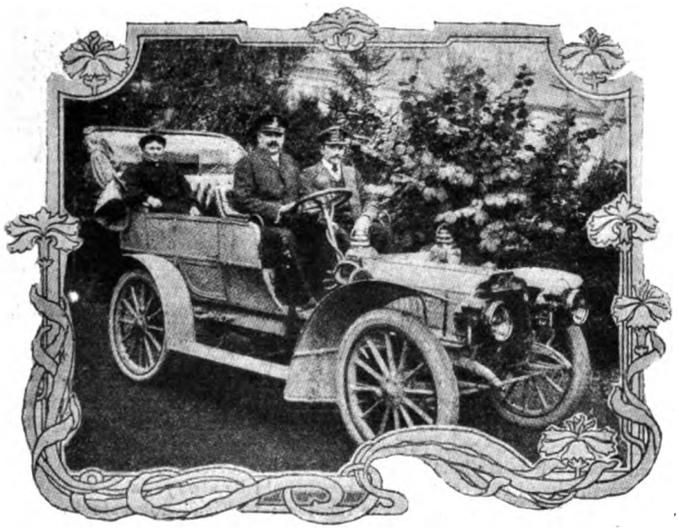
Your correspondent, "Tally Ho," has apparently never driven a car with hand control, otherwise his remarks would not be so satirical. For fineness of control, no foot arrangement can equal the hand control, and to be continually dodging the right foot from accelerator pedal to brake pedal, when in traffic, is to my mind far from being the ideal.—Yours truly,

S. C. N.

THE LANCHESTER CAR.

To the Editor of *The Motor-Car Journal.*

Sir,—Perhaps my experience may be of some assistance to your correspondent, "A. U." I have driven a Lanchester constantly for some time, first as an air-cooled car and now as a water-cooled one. I do all my own adjustments and machinery work, keeping a boy to clean the carriage work, look after the tyres and fill up with oil and petrol. The car must be out every day and in all weathers, and sometimes my work (that of a surgeon) takes me long distances into the country. I have now completed nearly 10,000 miles, with only one roadside stop for repairs or adjustments,



Digitized by Google

barring tyres. I make a point of going over the engine myself and making any necessary adjustment before attempting a long run.

As for your correspondent's first inquiry, when I was fitting a throttle of my own design I took the opportunity of examining the valves. That was some five months or more ago. They were in perfect condition, and I have not seen them since. It took me about three-quarters of an hour to get at them, mainly because I had never done it before and partly because long service had rusted the bolts and nuts. Three friends of mine who have been driving Lanchesters for periods of one to two years have not yet examined their valves. I don't think they are the source of much inconvenience, and they ought not to be difficult to replace.

As to the fans, I never had any trouble with these, but an air-cooled car needs very careful driving in summer. The water-cooled vehicle is infinitely superior. I have made many long runs, such as Bath to Birmingham without stopping, and Bath to Exeter twice with only one stop at Taunton, in the middle of summer without any overheating troubles, but it takes a lot of discretion and care. Even with an air-cooled car, I could always average twenty miles per hour on a reasonable road in hot weather, but, all the same, I would rather have my water-cooled engine. The fans, with great care, will keep the cylinders cool on hot days. The nuts and threads are not standard, but the company give a good supply of spares, so I have had no trouble so far. I can average anything from eighteen to twenty-five miles per gallon of Pratt's A, according to the load, road, etc.

My experience of the Lanchester Company has been that their charges are not unreasonable and that if any part is ordered by telegram or letter, that part leaves by the next train after receipt of the message.

Herr R. Thiem, Vice-President of the Alsace Lorraine Automobile Club, on his 16-20-h.p. Richard-Brasier Car.

The company, moreover, seem to retain a genuine interest in their cars after they are sold, and if one is in doubt about how to make any adjustment or replacement they furnish full particulars by return, illustrated by diagrams where necessary.

My opinion of the Lanchester car is that it is one of the most consistently reliable, if not the most reliable, of all cars on the market; for a medical man it is stylish, quiet, easy to manage, and unsurpassed by any other make. I have driven several makes before trying a Lanchester. I was biassed against them at first, partly because the price was more than I could easily afford. However, I have never regretted my choice. It is perhaps unnecessary to add that I have no interest whatever in the company.—Yours truly,

F.R.C.S.

To the Editor of *The Motor-Car Journal*.

Sir,—In answer to "A. U." in the last issue of the *Journal*, I am pleased to be able to answer his questions, having driven Lanchesters for the last two years, and covered some 15,000 miles. 1 and 2. Valves, both exhaust and inlet, are perfectly accessible. They never want grinding in, could be replaced in half-an-hour, but they never cause trouble; in 10,000 miles I have only renewed one inlet valve, and that was not absolutely necessary. 3. Fans, if carefully cleaned periodically, are not noisy or liable to go wrong. 4. Yes, if engine is used rationally, and the mixture carefully adjusted. But why trouble about the air-cooled car? The new water-cooled is far ahead of the early air-cooled in every way. Pump or water-circulation gives no trouble whatever, and the engine is practically "fool proof." 5. I think I am correct in saying that at any rate the smaller nuts are not standard, as the pitch of the Whitworth thread becomes proportionably coarser as the size of the nut decreases, hence the smaller nuts have not a thread suitable to withstand the vibration and strain in a motor-car engine. The Lanchester accordingly have their own thread, but to me it has never caused the slightest inconvenience. 6. Average mileage per gallon is from twenty-two to twenty-seven. I did last month (December), with fearful roads, rain and snow and fog, 640 miles in four days, using twenty-eight gallons of petrol, which works out at as near as possible twenty-three miles per gallon. I have frequently done, in summer, 107 miles on four gallons, say twenty-six miles per gallon. 7. The company are most fair and most prompt in all repairs. An estimate is always given, and not carried out except with full consent of owner, I am in no way connected with the firm.—Yours truly,

Arthur N. Pazolt.

To the Editor of *The Motor-Car Journal*.

Sir,—As one who has had a great deal of experience with the Lanchester car, I venture to reply to the letter of "A. U." in the last issue of the *Journal*. The valves are not easy to get at, particularly for an amateur, as it necessitates taking down a considerable part of the engine. One accustomed to the Lanchester system might detach, grind in, and replace both sets of valves in three hours. The fans occasionally get very noisy, they are not always effective, but generally so. The nuts and threads are the Lanchester Company's standard. The mileage per gallon is anything from seventeen to twenty-four miles.—Yours truly,

Semper Paratus.

To the Editor of *The Motor-Car Journal*.

Sir,—In reply to "A. U.," in the *Journal* of January 7th, I have had three years' experience of the above cars, and my answers to the points he raises are as follows:—

1. Are the valves easy to get at to grind in?

There is only one valve in each cylinder giving admission and exhaust to the explosion space, and out of which the pressure and direct heat of the same comes. Moreover, it is kept cool by the incoming charge. The result is that the valves need scarcely any attention. This main valve can be taken out in less than ten minutes. In 10,000 miles I have only had one valve which required attention.

2. About how long would it take to replace a broken exhaust or inlet valve?

About twenty minutes, but as this so seldom happens it is not a serious matter.

3. Are the fans liable to get noisy or out of repair?

Yes, if they are neglected, but if they are looked after, say once a month, properly oiled, and the tension adjusted, no. The noise is produced mostly by mud being splashed up underneath the car and getting between the flywheel and the fan pulleys. This is now obviated by a screw.

4. Will the fans keep the cylinders cool on a warm or hot day?

The difference between a summer's day and a winter's day may be fairly represented by 40 deg. F. As the cylinders probably reach a working temperature of 400 deg. F., the addition of 40 deg. F. does not make much difference. On a hot day with a following wind, and a long hill, the cylinders do get rather hotter than is pleasant from the smoke point of view, but a very few minutes' rest will put that right.

5. Are the nuts and threads standard or only made by the Lanchester Company?

If "A. U." means by standard, "Whitworth," they are not, with the exception of a few, for the very good reason that Whitworth threads are of no use in machinery which is subjected to vibration, and it is necessary to use a fine thread. Unfortunately, with the exception of a "cycle thread" standard, there is no standard in England which is suitable for motor-car work. I understand that there is a Standards Committee sitting now, which will bring one out. Until this is adopted, no nut on A's car will fit any bolt on B's car, or C's, for that matter.

6.—About what is the average mileage per gallon?

Taking the whole year's running, which includes every short run, such as station work, shopping, etc., and other petrol consuming runs, as well as touring, the mileage averages about 20 per gallon.

I have made careful tests of both my 10-h.p. and 16-h.p. air cooled cars on the London Road *via* Coventry both at an average speed of 20 M.P.H., non stop, roads in fair condition. The cars were carefully emptied both as to tank and carburettor, and four gallons of petrol put in, and then run till they stopped. The result is:—

10-h.p. 4 galls. Pratt's A, gross weight 23·75 cwt. 102·5 miles = 25.6 M.P.G.
16-h.p. „ „ Carburine „ „ 27.0 „ 138·5 „ = 34.5 „

The difference may be accounted for in the fact that the 16-h.p. car is more efficient in its transmission, and possibly the petrol.

(7.) Is the Lanchester Company reasonable or otherwise in its charges for repairs and replacements?

Their charges seem to me to be high, but not higher than other makers and agents, from what I hear from my friends driving other makes of car. My present car does not cost nearly as much in repairs as the early 10-h.p., owing to improvements in design and material.—Yours truly,

Charles W. Dixon.

SPARKING TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—I have a 12-h.p. car with two-cylinder high speed engine, trembler coil, and wipe spark. I have had a good deal of trouble with the firing; sometimes the motor would run remarkably well, and then all of a sudden would commence to miss fire, or one cylinder would almost chip out, and more especially if I advanced the spark. Everything seemed to be in perfect order. I may say I have always kept the wipe contact well oiled. I have now come to the conclusion that it is the wipe spark which is at fault, and that it is not so reliable as some of the other systems, and have decided to have a new contact breaker fitted. Before doing so I would like to hear the experience of your readers with wipe spark and others, and what is really considered to be the most reliable contact breaker for a two-cylinder car.—Yours truly,

Country Motorist.

THE FRENCH CLUB'S PROPOSED JOINT RACE.

To the Editor of *The Motor-Car Journal.*

Sir,—With reference to the decision of the French Automobile Club, I am personally very much opposed to the abolishing of the race for the Gordon Bennett Cup, or of its being run on the same day as another race. The Gordon Bennett has become universally recognised as a big sporting event, in which each country enters its three best cars to represent it. In my opinion the Automobile Club of France, representing as it does a nation which, very rightly, claims to be at the head of the motor industry, should be the last to propose to abolish the race for the cup, as they, having the choice of cars from among so large a number of manufacturers, should be quite willing to enter their three best cars against the three best cars of other nations, who have to choose from a much smaller number.

The proposal to abolish the race does not appear to me to be sportsmanlike, but from a business point of view I can quite understand that the French Club might wish to organise a race in which the chances of its country would be increased by having a larger number of cars to race against a lesser number of any other nation. If they desire to have a business competition of this sort, by all means let them have the Grand Prix; but I should look upon the abolishing of the Gordon Bennett as a calamity to the motor movement, inasmuch as it would put an end to what is undoubtedly regarded as one of the finest sporting events of the year, and is looked upon as being on the same plane as the yacht race for the America Cup, etc.

As regards the proposal that this year the race for the Gordon Bennett Cup and the race for the Grand Prix should take place on the same road and on the same day, if the entries are very numerous there will be the risk of the Gordon Bennett cars (which will presumably start first) overtaking and being hampered by the cars which are started last. Such an occurrence would certainly cause great dissatisfaction to the competitors in the cup race and the countries which they represent. Furthermore, if the entries are very numerous the intervals between the cars must be brief, and the risk of calamity must be considerably increased. The limit of cars in the Gordon Bennett race to between twenty and thirty is, in my opinion, very desirable, as tending to avoid accident and to secure permission for future races, whereas a race in which there are a large number of cars may result in many accidents, and consequently the prohibition of motor races.—Yours truly,

Chas. S. Rolls.

MAGISTRATES v. MOTORISTS.

To the Editor of *The Motor-Car Journal.*

Sir,—I enclose a cutting from the "Banbury Advertiser" of the 5th inst., recounting the conviction of a motorist at the recent Petty Sessions at Kineton, Warwickshire. It is, I think, a striking example of the severity with which certain magistrates, more especially in the rural and, I may add, hunting localities, are inclined to treat motor drivers. A similar offence on the part of the driver of a horse-drawn vehicle would probably have been met with a fine of half a crown at the most. If local benches are to be indefinitely allowed to inflict five pound fines whenever a motor driver is brought before them, no matter how slight or excusable his offence, the man of moderate means who can afford to buy and keep up a cheap car, but who is obliged to calculate the expenses of doing so carefully, will be afraid to own one at all. "So much the better," no doubt, in the opinion of the fine inflictors, but this is not the end which the Motor Car Act was framed to attain; neither is it the justice which used to be expected from English peers and gentlemen.—Yours truly,

A Cautious Motorist.

THE GRAPHITIC LUBRICATION OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal.*

Sir,—Would W. D. Bowman kindly state how much graphite would be required for a four-cylinder motor if mixed with the oil in the crank chamber. Also, would it not be better to blow some into the cylinders direct through the compression taps at the top, and, lastly, where can I obtain graphite, and at what cost?—Yours truly,

Wilfred B. Wateyn.

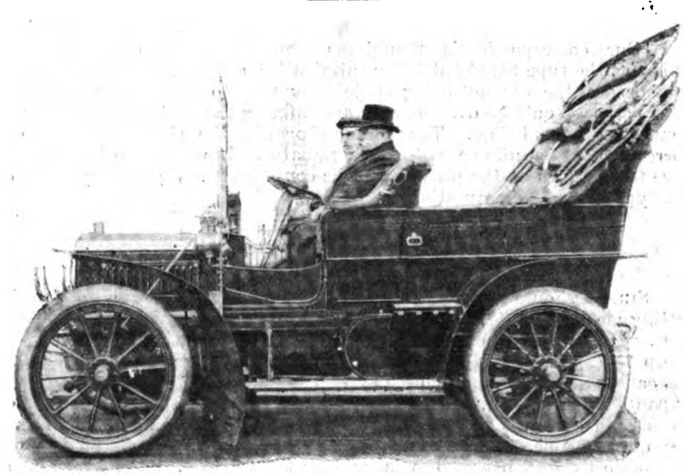
AN INTERESTING MOTOR QUERY.

To The Editor of *The Motor-Car Journal.*

Sir,—Re letters of A. 710 in your issue of 7th inst., and "Marine" of 31st December, 1904, I would remind your correspondents that however susceptible I myself might be to optical illusions, my watch can be accused of no such failing; and that my increase of power towards nightfall is not apparent, as they would suggest, but is very real.

On the run home in the evening I gain just on four minutes in the seven miles run, of which one and a quarter miles is fair up grade. No doubt, as A. 710 suggests, the lower temperature tending to more efficient cooling may give a very slight increase of power, but nothing like sufficient to account for a gain of four minutes in twenty-two, and that under adverse road conditions.

I, and no doubt many others of your readers, would be glad to read a short article by one of your expert contributors on the query raised by "Inquisitive One."—Yours truly,



W. Frederick Fortune.

A TRICK ON MOTORISTS.

To the Editor of *The Motor-Car Journal.*

Sir,—Just a line to warn your readers against a trick I saw played the other night. A car was travelling slowly through the traffic, and after it had passed me a few hundred yards I saw some boys run up behind it and blow out the lamp. I unfortunately could not stop to warn the driver, and I hope he met a lenient policeman; but it would be a serious matter if this trick were not put a stop to.—Yours truly,

J. M. MacLulich.

Mr. A. Ohlsson, Founder and Proprietor of the Ohlsson Breweries, Cape Town, on his 24-h.p. Napier Car.

Mr. Ohlsson, who has vast estates some 230 miles from Cape Town, has found that the train service to his estate is far too slow, and that he will be able by means of his car to cover the distance in less than half the time it would take him if he used the train. As there are several rivers on the road, and in parts it is strewn with large boulders and heavy sand, the car has been fitted with very large wheels, and a guard put over the engine, to enable it to successfully negotiate these obstacles.

PROPOSED STEAM CAR CLUB.

To the Editor of *The Motor-Car Journal.*

Sir,—I should very much like to call the attention of those of your readers who may be interested to the Steam Car Club, which it has been proposed to form. From the letters which I have received on the subject it is clear that there is real need for such a club. The exchange of ideas on so many points in common could not fail to have a beneficial effect, and would be to the advantage of all interested in these cars. There are many benefits that would result from the formation of such a club. It is, of course, perfectly obvious that its scope of usefulness will be greatly enlarged, and suggestions are invited in this connection. I shall be very pleased to hear from anyone interested in the above.—Yours truly,

T. Murphy.

ACCUMULATORS.

To the Editor of *The Motor-Car Journal.*

Sir,—Would some kind reader please instruct me how to change from using four dry batteries equal to six volts on a 12-h.p. 1903 Darracq with non-trembling coil and make and break? Can I change to accumulators with the present make and break and non-trembling coil, and what power of accumulators must I use, and would accumulators be as successful as the dry batteries, which have always done very well indeed?—Yours truly,

B. 205.

[It is a very simple matter to change the four dry batteries on a Darracq car to a set of accumulators, all that is necessary being to disconnect the dry

Digitized by Google

cells, and put the accumulators in their place, taking care to join the wire which was on the carbon terminal, to the positive terminal of the accumulator. With reference to whether four volts or six volts are necessary, the following experience may be useful. The engine will work well with a four volt accumulator, but if six volts is used a great advantage is gained, as a better spark is obtained all through, and the ignition is so good that there is a much greater range in advancing and retarding, and more power appears to be attainable. Moreover the coils on the Darracq cars are of such excellent quality that they will stand even eight volts without the slightest fear of breakdown. The only disadvantage in the use of six volts is that there will be more wear on the platinum contacts of the make and break contact breaker, so that these should be attended to and filed up at regular intervals. From practical experience gained by using a six volt accumulator on a Darracq car during the past summer, we should recommend the use of this in preference to four volts. There is plenty of room in the battery box to take a six-volt accumulator and a four volt spare one.]

MOTOR CIRCULATION TROUBLES.

To the Editor of *The Motor-Car Journal*.

Sir,—I shall be glad if you or any reader of the *Journal* will give me some information regarding the following query. My car has a 6-h.p. Phœnix Daimler motor. The large water tank at the back of the car has been taken away, and a radiator and tank, containing four gallons of water, fixed in front. A pump has been fixed, driven off the flywheel. I am troubled with the water boiling. I shall be pleased to know what can be done to remedy this. Could I increase the power by fixing plates on the ends of the pistons so as to obtain a higher compression?—Yours truly,

D. C. Glasgow.

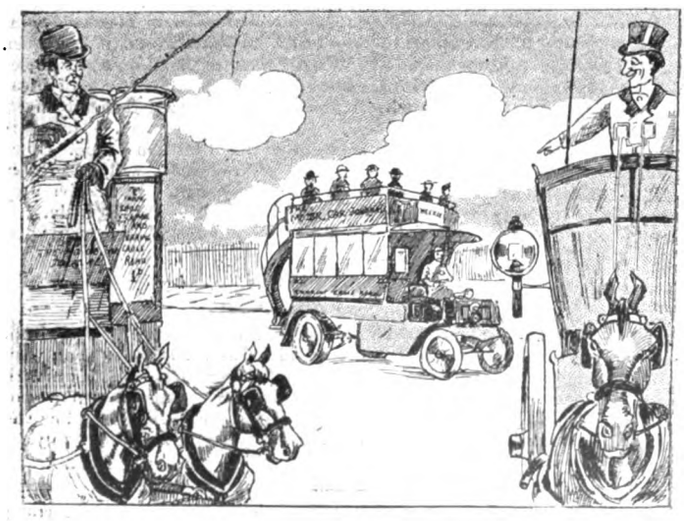
[Our correspondent's trouble is doubtless due to an inefficient radiator, the type fitted not being suitable for a 6-h.p. Phœnix-Daimler, the speed of the car not being sufficiently fast to keep the water cool. This perhaps could be overcome by again fixing the tank at the back, and connecting up as before. The method shown in the sketch sent by our correspondent is quite correct for the radiator. It would be of no advantage to fit plates on the pistons, as the compression is generally high on the type of engine in question.]

A COUPLE OF QUERIES.

To the Editor of *The Motor-Car Journal*.

Sir,—I should be glad if any readers of the *Journal* would oblige by letting me know:—(1) The best two-seater car single-cylinder now obtainable. How will the new 8-h.p. De Dion compare with the new three-speed 6-h.p.? (2) Is the fitting of Panhard type sliding gear in these 8-h.p. instead of the expanding clutch system an advance? I have found the expanding clutch to give immense satisfaction in the 6-h.p. The wear on the sliding system is presumably great, whereas the existing De Dion gears seem unwearable. I have found a single-cylinder De Dion better in point of comfort than most two-cylinder cars I have tried, but I note that at the price asked for single-cylinder De Dions firms are now offering two and even four cylinder vehicles.—Yours truly,

E. D. Fawcett.



CRACKED CYLINDERS.

To the Editor of *The Motor-Car Journal*.

Sir,—I bought a new 4-cylinder car last season, and the other day noticed that both cylinders were cracked and the water leaking very badly through the water jackets. The question is, ought they to have gone like this, and would frost be the cause? and what is my best remedy? The water in the tank was not frozen and nothing else happened, so I am curious to know what you or any of your correspondents think. The car has not been run for some time; the motor-house was not heated.—Yours truly,

Beginner.

[The cause of "Beginner's" cracked cylinders is without doubt due to the frost, unless by chance the water circulation is faulty, allowing the engine to overheat, and then suddenly passing cold water into the jackets. If the car were allowed to stand with the water in during the sharp frosts of a few weeks ago, we could most certainly say this was the cause. This could easily have been prevented by letting out the water. If it is only the jackets that are cracked, it may be possible to put a thin metal patch over; or, if not too bad, they may be rusted with sal ammoniac or painted with gold size and lamp black. In the event of failure in this, the only remedy is new cylinders.]

The Coming of the Motor-Omnibus.

SIGN POSTS.

To the Editor of *The Motor-Car Journal*.

Sir,—During last summer I had the misfortune to be fined £5 and costs for driving to the common danger through a small village the other side of Andover. I was on my 3½-h.p. De Dion car at the time, with one passenger, and the speed was timed at eighteen miles per hour; there was no traffic on the road, and I did not see any warning posts, although it was afterwards pointed out to me that warning posts were placed at the entrances to the village.

The posts in question carried no written notice to reduce speed, but simply a sign in the shape of a triangle. I did not know at the time the interpretation for this, and question very much the legality of same as warning posts; I believe that it is distinctly stated that motor vehicles shall not travel at a rate exceeding twelve miles per hour when passing through villages, but that notice boards must be erected denoting the approach to such a village. I fully realise the advantages of these signs, but can they legally be deemed to give any notice unless their interpretation is attached?

I would also like to draw your attention to the general position of the posts in relation to the village they serve. Those I have noticed have been placed practically in the village itself, so that a high powered car travelling fast could not reduce speed (except by undue strain) to the requirements of the Act. I would suggest that these posts be either placed further afield, or else an additional post similar to the advance signals used on our railways, be fixed in advance of the boundary signals.—Yours truly,

Sydney C. Newton.

MOTOR INSTRUCTION.

To the Editor of *The Motor-Car Journal*.

Sir,—Now that the season is, generally speaking, over, the motorist sits down to muse over his peregrinations during the past months, and having probably more leisure, he wonders if he cannot pursue his hobby in another direction than driving his car or launch.

The idea strikes the writer that it might be very much to his advantage if one could acquire the details in connection with the motor engine and electrical appliances, and he suggests private tuition, or that classes be formed, when pupils could have practical knowledge brought home to them, so that in the event of a breakdown in their journeyings they could more readily understand the machinations beneath the engine casings.

If such a monitor could be found, no doubt many enthusiasts would gladly take advantage of such tuition, and perhaps the publication of this might find some suitable instructor who would lay himself out for such an object. It is to be hoped the idea may be followed up, with so many amateurs who would be pleased to have the opportunity of acquiring such practical knowledge.—Yours truly,

Motoneer.

Electrically Driven Invalid Chairs.—"A. E. J." writes:—"Will any reader of the *Journal* kindly inform me through your correspondence column what firm make a speciality of electrically-driven invalids' chairs, controlled entirely by hand, and having a maximum speed of four miles per hour?"

Non-Slip Covers.—Replying to "Rice," who enquires for the Haurelt non-skid cover, we believe he refers to the Herault, which is made by M. E. Herault, 120, Boulevard Magenta, Paris.

Aeros Spring Buffer.—Replying to C. H. Phillips, full particulars of the Aeros spring buffers can be obtained from Mr. Leonard Harris, 169, New Bond Street, London, W.

Paraffin Carburettor.—In replying to "Heavy Oil" the Cremorne carburettor is made by the Cremorne Motor Manufacturing Company, 27, Lots Road, Chelsea, S.W.

Motor Spirit.—Replying to Mr. J. G. West, full particulars of the Shell motor spirit can be obtained from the General Petroleum Company, Limited, 19-21, Billiter Street, E.C.

HEATING AND VENTILATION OF GARAGES.

By N. B. Pope.

The problem of properly heating and ventilating garages is one which demands the serious consideration of every motorist, whether he keeps his car in a public garage or at home in a place of his own. A certain amount of heat must be supplied during cold weather to keep the working parts of the car in good order, and to render less barbarous the necessary labour of washing and oiling. That ventilation is needed wherever petrol is in use is axiomatic. Moreover, as the conditions are at variance with the factors which obtain in the more usual work of a ventilating engineer, the subject in its full breadth is mostly of considerable technical study. Herein, however, we will merely attempt to enunciate certain principles, and to suggest a simple method or two by which the desired results may be obtained.

The conditions involved in the case of a large garage, comprising shops, offices, and several floors, are too numerous and complicated to be taken up in detail, but in the small garage and private motor-house they are less complex and are, perhaps, of more vital interest to the average motorist. Considering first the matter of heating, the problem is to keep the storage place at a reasonably uniform temperature throughout all weather changes, and this without danger of igniting the vapours which are so much to be dreaded, or of causing spontaneous combustion among the various kinds of timber often found lying about.

The temperature which is to be maintained, with which the choice of method to a large extent varies, depends chiefly on the fancy of the owner. The only absolute requirement is that the temperature shall never get low enough to freeze the water in the tanks and pipes. This is essential, not simply because of the dangers attendant upon freezing the cooling water of petrol cars or the boilers of steamers, but also on account of the unpleasantness of working about cold machinery, and the difficulty of filling grease cups and lubricators when the oil is congealed. Besides, if kept in a cold stable, the bearings of a car become so stiff as to use up considerable extra power when run again, while if they are kept reasonably warm when the car is standing they will not stiffen up while on the road, except in extreme weather. Moreover, certain types of carburettors give trouble when cold.

Its inflammable character and the fact that petrol vapour is heavier than air make it imperative that the heater be one which contains no open fire—at least within the walls of the building. As it is necessary that petrol be handled in the garage, the precautionary measures must consist essentially of placing the fire where the vapour cannot come in contact with it. This may be done by locating the source of heat in another building or in a compartment of the same building, which is partitioned off by fireproof walls, and having its entrance from the outside only. Basement boiler and furnace rooms, as used in other buildings, are out of the question. And in this connection it may be noted that the use of basement floors in a garage is always unsafe, unless special ventilation is provided for removing the heavy gases which accumulate there. The not uncommon practice of locating shops and battery charging rooms in ill-lighted, unventilated sub-floors is extremely dangerous, both on account of the fire risk and because of the unhealthy conditions which are to be found there.

The heating of any building may be accomplished by either direct or indirect radiation. It may have its own heating system or it may be one of a system of several deriving their heat from a central plant, just as the several floors may be heated by a single furnace. As to the method of distributing the heat to the air in various rooms, this may be done by placing the radiating surface directly in the room and heating it by circulating through it some conductor, like hot water or steam, or the radiating surface may be outside the room and the air heated by being passed over it and then to the room by pressure or induction. The latter method introduces a combined heating and ventilating system. Evidently this method is particularly applicable to motor houses, as it eradicates not only all fire but all heated surfaces which might cause the charring of dry wood or waste, and the ignition of the petrol vapours in an indirect way. But this method, involving as it does the installation of fans and heating stacks, is too expensive for use except in elaborate establishments. It is a comparatively simple matter, in many cases, to use steam or hot water heat, piping the supply from a neighbouring building. This is applicable to many of the small private garages.

Where it is necessary to heat the building independently there are several satisfactory methods which may be employed. One consists of a small heater, using oil or perferably gas, placed in a metal sheathed compartment on the outside of the building, to which access is obtained from the outside. Within, on the adjacent wall, is placed a combined radiator and expansion tank of simple construction. On the same principle any small heater, as is used for greenhouses, for instance, may be employed, the coils being laid upon the more exposed walls and under the windows.

A simplification of this is to build the compartment sufficiently large to enclose a stove, and to place a sheet iron bell over the latter leading to a register in the wall. The inside of this "lean-to" erection must be lined with sheet metal, and a considerable air space allowed between the lining and the sheathing to prevent undue leakage of heat. The efficiency of such a method would depend largely on the construction of the building and the amount of leakage of heated air through the roof and walls, which could easily be reduced to a practical minimum, and the system thereby made very effective.

Turning to the subject of ventilation, it will be seen that the capacity of the ventilators must be sufficient to remove any excess of vapour which may be caused by unlooked-for conditions in the car, or due to evaporation while filling or using the petrol for cleaning purposes. Heated air rises. This fact must be the basis of all considerations of the ventilating problem, and in many systems it is used to induce a circulation of air from all parts of the room to one at the top. But, as already stated, petrol vapour is heavier than air, and must always tend to stay near the floor, except when stirred by a draught. Therefore the air outlet in a garage must be at the bottom of the room instead of at the top.

Many motor houses, especially the small ones, are so flimsily built and have so much free ventilation unavoidably that no special provision is considered necessary. But as a safeguard against emergencies, particularly at night, when a flooding carburettor or a leaky pipe joint may be the means of distributing petrol over the floor, absolutely certain ventilation must be secured. The complete indirect method of heating and ventilating may be applied to large or expensive garages with the best of success; but for the small structure a very simple method, which should be effective in clearing the danger zone within a few inches of the floor, is as follows:—An ordinary stovepipe is run up one of the walls of the building and projecting through the roof, is topped with a ventilator cap. At the bottom it is left open a few inches above the level of the floor. Part way up the wall it is heated by close contact with the radiator; or it may be jacketed and heated by the burning gases from the stove, but this is not to be recommended on account of the danger from sparks in the smoke passage. The air within it, thus heated considerably above the mean temperature of the room, will rise, and form an appreciable draught, thus drawing from the floor by displacement. It will be seen that the effectiveness of this depends on the amount of heat which can be concentrated about the pipe at one point. The other radiating surface must be so disposed as to aid a circulation of air about the room, and produce a swirling current towards the outlet.

Were the outlet to be made simply a register in the outer wall of the

Automobile Racing in Florida. A Group of Cars on the Beach at Daytona.

Digitized by Google

building, instead of serving as a ventilator, it would act as a cold air inlet, the heated air within drawing in more and more by displacement, and as a result there would be no real ventilation. If the natural tendency of the air be used, and the outlet be at the top of the room, as in many of the older systems in present use, a current of heated air will be set up in an upwardly curving line from the radiator to the outlet; the heat will largely go to waste, and eddies of stagnant air will accumulate along the floor. This is what must be particularly avoided in motor-houses, as it is the floor line which must be cleared first. By reversing the natural tendency, wholly or in part, and placing the source of heat upon the walls, or at the top of the room, and drawing away the spent air and gas from the bottom, uniform heat distribution is secured and the necessary drainage effected. —The Horseless Age.

NOISE AND LICENCE.

Edwin Newey, Solihull, has been summoned under the Motor Car Act for not using means to prevent his motor-car making an unnecessary noise.—Police-constable Taylor said that on the afternoon of the 24th ult. he saw the vehicle standing outside a shop in Warwick-road, Acocks Green. He watched it for eight minutes, during which the machinery was vibrating. Defendant denied that he was in the shop more than two minutes, and he also said he was ignorant of the fact that he should have stopped his engine.

A further summons was then proceeded with for failing to produce a motor-car licence. Defendant now handed in a licence, but it was found that it only referred to a motor-cycle. Police-constable Taylor said that when asked for his licence, defendant told him he had left it at home Defendant stated that he had the licence produced at the back of the car at the time, but he did not find it until afterwards.

A fine of 10s. and costs was imposed on the first summons, and of 40s. and costs on the second.

AUTOMOBILE RACING IN FLORIDA.

Preparations for a series of automobile races on the Ormond-Daytona Beach, Florida, from the 23rd to the 28th inst. are well in hand. The programme will comprise about thirty events open to the world. From a local correspondent we learn that the condition of the Ormond-Daytona Beach this winter is magnificent; according to old residents it was never better. Its sand is composed largely of the shells of the coquina clam, peculiar to this part of Florida. This shell is about half an inch long and very thin. For ages nature has been rolling them up, washing them back into the surf and pulverising them. Examined under the microscope each particle is round, unfit for mortar, builders say, because its smoothness prevents it from holding together; yet, strange to contemplate, the very moment a wave leaves the wet, apparently soft beach, these round particles settle down into almost a cement as hard as asphalt, beyond the comprehension of those who have not seen it. Regardless of weather conditions there is no mud, no dust, tyres are never heated owing to the moisture, and an exploded tyre is unknown. Here, too, the great dangers of road and track racing are entirely eliminated. Road repairs are unnecessary, as twice each twenty-four hours it is entirely rebuilt by the tides.

Being almost level and with an average rise and fall of only two feet nine inches at extreme low tide, the beach is from three hundred to five hundred feet wide and can be used from two hours after until two hours before high tide, thus giving an average of seven to eight hours a day for motoring.

Mr. J. F. Hathaway, the veteran motorist who suggested and organised the Florida East Coast Automobile Association, under whose auspices the Ormond-Daytona Beach tournaments have developed a wide-world reputation, brought one of the first motor-cars ever seen in Florida, and had many queer experiences with the natives, who at that time were very much opposed to these "new-fangled machines."

Great changes have taken place in Daytona during the past five years and there are now claimed to be more automobiles in the town than in any other of its population in the world. During the past summer the Florida East Coast Automobile Association, which has a membership of 200, has erected a most attractive and commodious club-house on the beach directly opposite the half-way post of the twenty-mile course. At Ormond a large garage, with all modern conveniences, has been erected, besides a mechanicians' club-house with a comfortable club-room and thirty sleeping rooms.

AN APPEAL ALLOWED.

Before Mr. Loveland-Loveland, K.C., at the Clerkenwell Sessions, Mr. C. S. Gabriel, of Park Street, St. James', W., appealed against a decision of Mr. Kennedy given at the West London Police Court on the 2nd August last, convicting him for that he did, on the 16th day of June, 1904, on a public highway called Kensington Road, unlawfully drive a motor-car at a speed which was dangerous to the public. Mr. J. P. Grain (instructed by Messrs. Wontner and Sons) appeared for the police, and Mr. Horace Avory, K.C., and Mr. A. Moresby White (instructed by Mr. Staplee Firth) appeared for Mr. C. S. Gabriel, the appellant.

After hearing the evidence of four policemen on behalf of the police and the evidence of Mr. Gabriel and two of his witnesses the Court stopped the case and allowed the appeal. Upon the application of Mr. Horace Avory, K.C., the Court also ordered the police to pay Mr. Gabriel's costs of the appeal.

CASE DISMISSED.

Last week, at the Lambeth Police Court, summonses were heard against Mr. J. E. Staples for unlawfully driving an unregistered motor-car on a public highway, bearing a general identification mark, the said car not being used for trial after completion, or on trial by an intending purchaser, and Mr. Ernest Gould was summoned for that he did, on the same day and place, aid and abet in the commission of the said offence. Mr. E. C. Hemmerde, instructed by Messrs. Kenneth Brown and Co., appeared for the defence. The circumstances were that on the day in question a motor-car, which was a second-hand one, and used solely by S. F. Edge, Limited, for trial purposes, was sent to Croydon with a spare wheel and a towing rope for the purpose of assisting another car belonging to a private gentleman which had met with an accident. Use was made of a car which had just been overhauled and repaired for the purpose of trial and to which was affixed the general identification mark allotted to S. F. Edge, Limited. Whilst proceeding to Croydon the driver was stopped by a policeman who contended the car was not being used for trial purposes. Subsequently the police interviewed Mr. Gould and he admitted that the car had been sent out under his direct written instructions for the purpose above stated, and on this ground the police issued the summons for aiding and abetting in the commission of the said offence, they contending that as Mr. Gould gave instructions for the driver to drive the car he was responsible. The defence was that the circumstances as above related constituted no offence under the Motor Car Act, and that the mere fact of a car having in it at the time a spare wheel and a rope did not necessarily mean that that car was not in point of fact used for a trial after completion, and that for that reason the driver had committed no offence, and Mr. Gould had not in point of law aided and abetted. Mr. Hopkins, the magistrate, upheld this view and dismissed both summonses.

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Alton.....	Driving negligently	£3.
Grantham.....	Reckless driving	£2, etc.

S.W. London	Furiously riding a motor-cycle	Dismissed.
Clerkenwell Sessions	Appeal against conviction for dangerous driving.	Convict'n upheld
,, ,,	Appeal against conviction for exceeding legal limit.	Appeal allowed.
Bolton Quarter Sessns.	,, ,, ,,	Appeal allowed.

The annual diary known as the "Agenda Buvard," published by Madame Lockert, of *Le Chauffeur*, has now become an institution. The 1905 issue, a copy of which has been sent us, contains as usual a number of interesting caricatures of prominent French motorists and motor-car builders, for which alone the diary is well worth the small figure charged.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JANUARY 21, 1905. [No. 307.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

[Readers, Subscribers, Correspondents, Advertisers, and all others who write to THE MOTOR-CAR JOURNAL are reminded that the new Offices are at 27-33, Charing Cross Road, London, W.C. All communications should be sent to this address.]

COMMENTS.

The Working of the Act.

THE paper which Mr. Moresby White read at the meeting of the A.C.G.B.I. last week was both suggestive and useful. On another page we publish its leading points, and would emphasise the hint given by the author as to motorists, when stopped by the policeman, obtaining all the evidence possible to assist them in rebutting the charges at the police-court. Very often, in the crowd that inevitably gathers around a policeman and a motor-car, may be found some sympathetic and discerning person, whose definite statements of facts should be worth more than the opinion of the policeman. As a rule, magistrates are inclined favourably towards what the constable "thought" and what he gives as his "opinion." But, from a legal point of view, such is not permissible; and motorists may well take a hint from the paper, and challenge any such "views" likely to prejudice their cases.

◆ ◆ ◆

The Limit in the Royal Park.

DISCUSSION on the paper was opened by Mr. Staplee Firth, whose encounters with magistrates have frequently assisted local journals to find columns of excellent "copy." Mr. Firth rightly criticised the enactment which requires the endorsement of licences for offences of a very minor character—offences which, from a common-sense point of view, would not be indictable, but which under the Act are magnified into great delinquencies. For instance, because the rear light goes out and a constable happens to be looking, a man may have his licence endorsed as well as the worry of a police-court appearance. Surely, if punishment is to be meted out to such an one, a mere fine would suffice without other indignity. On the question of the speed regulations in Royal parks Mr. Firth was very emphatic, and the facts he gave tended to show that these have not yet received full and legal sanction—a view that should be tested without delay.

◆ ◆ ◆

Amendments for the Future.

MR. MORTIMER'S contribution to the debate was brief but helpful, and we agree with him upon the necessity of continuing the automobile education of magistrates in view of the operation of the law in the future. As he remarked, advocates have not only to win cases, but they should also consider the effect that they exercise upon the minds of the justices. Every effort should be made to get magistrates to realise that motorists are not so bad, after all; and besides that, the time is coming when the question of possible amendments to the Act will have to be considered. Then the influence of magistrates—favourable or otherwise—will be a factor in the settlement. Mr. Shrapnell Smith was able, in the course of the discussion, to tell of an automobile club with ninety members, thirty of whom are county J.P.'s. When such facts can be shown motorists should find encouragement in a spirit of toleration towards the Bench, even though a similar good feeling has not been exhibited in the past.

◆ ◆ ◆

Traders' Marks.

ONE point which escaped full consideration was that which referred to traders' marks. This section of the Act is most unsatisfactory, and seems better designed to harass dealers than to assist them in the development of their business. The original idea was to issue a general identification mark which could be used on all the vehicles employed by a trader in a business way. As the Act was primarily designed to secure the identification of offenders on the road, we should have thought that all that was necessary was a mark sufficiently clear to trace the ownership of any car. But the way in which that particular provision of the Legislature has been interpreted is to lay the trader open to all sorts of charges of fraud and roguery never contemplated when the Act was being passed through the Houses of Parliament. At present the trader who does not want to run risks has to register each car; that is practically the only safe way of escape. When the time comes that clause will have to be thoroughly revised, and the regulation clearly established that the payment of one fee should cover any number of vehicles that the dealer may take from his showroom or his works for trial runs in the ordinary way of trade. Nothing short of that will be acceptable to the trade.

◆ ◆ ◆

The Endorsement of Licences.

SHOULD any revision of the Motor Car Act take place, we trust a strenuous effort will be made to secure something like reason in the endorsing of licences. In the minor offences the magistrate has no option. He must endorse licences, although there may be extenuating circumstances which ought to be taken into consideration. If the rear light happens to go out, or, as a correspondent suggests, be blown out, or if a motorist has changed his coat and inadvertently left his licence at home, the licence is endorsed. That is the law, which in this case has a finality as stringent as that of the Medes and Persians. But if a man careers along at an acknowledged reckless pace the magistrate need not then write the record of his misdemeanour, even though the offence in the latter case is wilful and dangerous, while in the former instances it is simple forgetfulness or absolute ignorance.

Proposed Club for Sussex.

A MEETING of Sussex automobilists has been convened by the Motor Union for Saturday, the 28th instant, to be held at the Old Ship Hotel, Brighton, at three o'clock. The purpose of the meeting is to form a County Automobile Club for Sussex. There has been a strong feeling in the county for some time that it is very desirable that an organisation of this character should be brought into being, and among those who

Digitized by Google

have already intimated their intention of supporting the proposed Club are the following:—Major R. C. Turnor, Captain J. G. R. Homfray, Messrs. B. Y. Bevan, A. M. Singer, J. Lereculey, E. G. Cundy, E. G. Miller, H. C. Stringer, Captain F. D. Lyon, and Mr. Alderman Buckwell, of Brighton; Messrs. J. J. Hissey and E. T. Vine, of Eastbourne; Earl Russell, and Messrs. William James and M. F. Mieville, of Chichester; Messrs. Edgar Soames, J. Godwin King, and E. M. Crookshank, J.P., of East Grinstead; Messrs. C. J. Lucas and A. S. Dickins, of Horsham; Dr. Chas. Ormerod and Mr. S. H. Norman, of Burgess Hill; Captain Gerald Spencer, of Lewes; Mr. G. Hennessy, of Haywards Heath; Mr. R. S. K. Eyre, of Crowborough; Mr. Boyle Lawrence, of Bognor; Messrs. H. S. W. Eyre and C. F. Frowd, of St. Leonards-on-Sea; Sir James Duke, Bart., of Laughton; Mr. W. Bramson, of Arundel; Mr. N. Leslie, of Henfield; Mr. Arthur Biden, of Cooksbridge; and Mr. F. A. Potts, of Wadhurst. Any car owners in Sussex who have not yet put themselves in communication with the secretary of the Motor Union should write to him at 16, Down Street, Piccadilly, London, W.

The Scottish Trial.

So satisfactory has been the response of motor-car manufacturers to the recent circular of the Scottish Automobile Club with reference to the Reliability Trial, that it has been decided to proceed with the provisional arrangements. The date —May 11th, 12th, and 13th—has been definitely fixed, and the committee of the club are now framing the rules and conditions of the Trial. Arrangements are also being made for a preliminary survey of the suggested routes. More than Scottish interest will be taken in the event, which, so far as organisation is concerned, may be expected to run as smoothly as the Glasgow to London trial, which the new fixture has superseded.

◆ ◆ ◆

Motor Restrictions Abandoned.

After all, the motor restrictions in the Holland division of Lincolnshire are not to be enforced. As previously stated in this *Journal*, a proposal was made by the County Council to prohibit the motor-car traffic at night time on the Deeping High Bank and the Peakirk Bank, while it was proposed to enforce a 10-miles limit on the Spalding and Crowland Bank after dusk. Naturally, the proposal gave rise to a considerable amount of opposition, and petitions were sent in to the County Council, asking them to reconsider the matter and withdraw the proposed restrictions. Motorists will now be glad to know that these petitions have had weight with the Committee which was appointed to deal with the question, for at a recent meeting at Spalding they reported that in consequence of the petitions and objections they recommended the County Council to withdraw the proposals altogether, although they still held that the roads were dangerous. The recommendation of the Committee was approved. The fact should not be overlooked that motorists have their own safety to consider as well as the safety of the general public, and they will naturally use the roads with proper care when driving along them after dark.

◆ ◆ ◆

London and Birmingham.

Some idea of the growth of the automobile movement since the Motor Car Act of 1903 came into force can be gleaned from reports which have just been presented to the registering authorities of London and Birmingham. Within the jurisdiction of the London County Council 12,000 licences were issued last year to drivers of automobiles, and no fewer than 8,250 motor-cars and motor-cycles were registered. 1,217 drivers' licences were issued and an almost equal number of cars were registered at Birmingham in the twelvemonth. These figures, of course, refer to only two centres where automobilism flourishes most, but they are illustrative of the significant advance made during 1904.

◆ ◆ ◆

The 5,000 Miles' Trial.

The second week of the trial of the 12-h.p. Siddeley car, under the supervision of the Automobile Club, was concluded on Saturday by a run to Folkestone and back. The week's runs had been most satisfactory, not a single involuntary stop having been registered. Close on 2,000 miles had then been covered, the journeys during the week being to Coventry, Marlborough, North Leach, Southsea, Southampton, and Folkestone. Despite the heavy condition of the roads, the Continental tyres ran without a puncture. These latter are of the 815 by 105 mm. size, with square tread, and, considering the condition of the roads, have done remarkably well. On Monday and Tuesday the 5,000 miles trial was continued and the car added another to its long list of runs in which no involuntary stops were recorded. The journey was to Southsea and back, and the roads were very heavy, owing to the rain and thaw. On Wednesday the journey was to Worthing, through Epsom, Dorking, and Arundel.

◆ ◆ ◆

A Word to Certain Drivers.

A motor-car driver who attempts to handle a car whilst drunk may expect little sympathy from motorists or magistrates. A driver of a car belonging to his employer spent an hour and a half the other day in rushing wildly about some of the streets in Ryde, and generally alarming many of the good people of the Isle of Wight. When it was discovered that he was drunk a constable apprehended him, and at the police-court he pleaded guilty. In addition to fining the delinquent the Bench ordered that his present driving licence should be taken away, and his next licence, to be obtained on the 22nd of the present month, should be suspended for three months from that date. Under Section 12 of the Licensing Act, 1872, which by the provisions of the 1896 Motor Car Act is applicable to motor-car drivers, a person "who is drunk while in charge of any carriage on any highway" is liable to a month's imprisonment with or without hard labour. That may have been known to this particular offender, but the idea of suspending a licence not yet granted was perhaps new to him—this being the first time such a course has been taken. This was done by reason

Digitized by Google

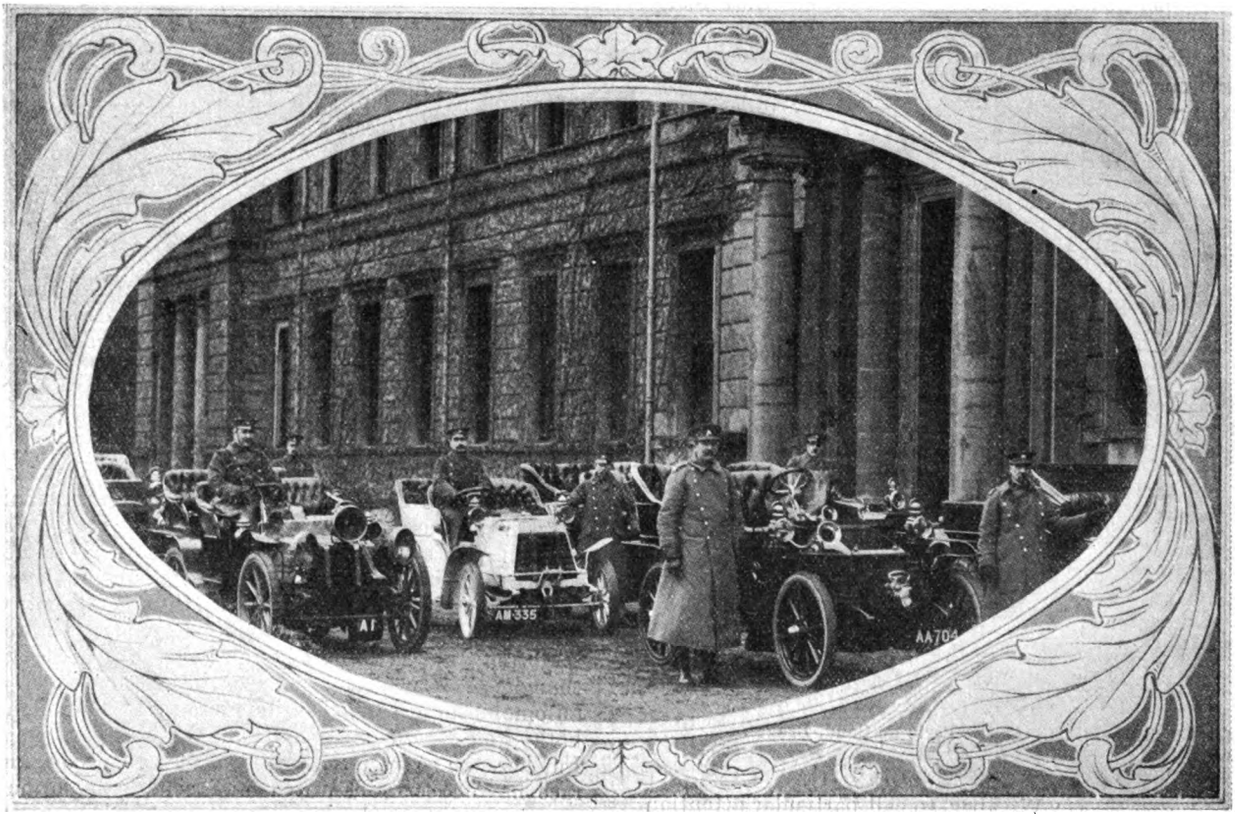
of Section 4, which gives the magistrates power "to "declare the person convicted disqualified for obtaining a licence for such further time after the expiration of the licence as the Court thinks fit."

◆ ◆ ◆

Motor-car v. Motor-Car.

SEVERAL mishaps in which motor-cars have been involved have been recorded during the last few days, and, curiously enough, collisions between automobiles have been as frequent as those in which motor-cars have met vehicles of other descriptions. In a dense fog near Worksop the other night a motor-car belonging to the Duke of Portland was proceeding to Welbeck, when a brewery motor-van, coming in the opposite direction, endeavoured to avoid an encounter. In doing so a milk cart standing by was smashed. At Manchester an electric tramcar stopped without apparent warning to a motor-car that was travelling behind. The latter was caught by the step of the tramcar and overturned, with the result that the passengers were seriously injured. In East London, on Saturday, two motor-cars collided; the wheel of one of the vehicles came off and the occupants were precipitated into the roadway. From the report on another page it will be seen that a collision between two motor-cars in Ireland has resulted in the owner of one obtaining £100 damages from the owner of the other. Such cases should emphasize the necessity for careful driving.

◆ ◆ ◆



Motor-Car Imports and Exports.

ALTHOUGH there was again a falling off in the number of foreign motor-cars imported to this country during the past month, there was, on the other hand, a marked increase in the value of the imports. The number of cars imported in December is returned as 211, of a value of £97,888. Parts were responsible for £20,085, bringing up the total for last month to £118,573, as against £87,082 in December, 1903. The returns for the whole of the past year show that no fewer than 5,378 cars were imported, these, with the parts, attaining a value of no less than £2,423,940, an increase of, roundly, £435,000 as contrasted with 1903. Passing now to the exports of British automobile productions, the returns are not quite so satisfactory. Altogether 94 vehicles were shipped last month, which, with the "parts," attained a value of £41,882, bringing up the total for the year to £321,966, which compares with £344,325 in 1903.

◆ ◆ ◆

Heavy Motor Traffic.

THE regulations issued by the Local Government Board, under Section 12 of the Motor Car Act, 1903, relating to the weight, use, construction, and speed of heavy motor-cars, which regulations come into force on March 1st, have been criticised by Mr. E. B. B. Newton, C.E., borough surveyor of Paddington, in a report just presented to the Works Committee of the Borough Council. Mr. Newton observes that the new cars will probably move at a greater speed than a steam roller. What will be their effect upon underground pipes and mains can, according to Mr. Newton, be surmised only, but he considers that an immense amount of damage will be caused. "There can be no doubt," he says, "that if the number of mechanically-propelled vehicles in use upon the roads becomes greater as a result of these new regulations, the expense of road maintenance will be increased. At the present time the paving material of many of the roads in Paddington is entirely unfitted to sustain such heavy traffic, and, should the use of heavy motor-cars become general, flint, gravel, and granite macadam will have to give place to wood, asphalte, granite sets, etc., with consequent increase to the burden of the taxpayers." The Works Committee of the Paddington Council recommend that the Local Government Board be informed that the Council strongly object to the proposed new regulations for heavy motor traffic.

The Leeds Limit.

THE application of the Leeds City Council to limit the speed of motor-cars to ten miles an hour within a two-mile radius from the centre of the city evoked considerable local interest. At the inquiry the Town Clerk pointed out that the Watch Committee and other local authorities were anxious in the matter, mainly owing to the fact that many of the streets were congested. The tram service materially assisted in this congestion. The Chief Constable put in a census of the amount of traffic at several points within this radius, taken on January 5th, which went to show that these are certainly busy streets, although we do not think that the limitation of the motor-car speed pace to ten miles an hour would wholly effect the object in view. Replying to Mr. Rees Jeffreys, the Chief of the Police held that Leeds was in a worse position than Manchester, Bradford, and Hull; and, concluding his defence, the head of the legal department of the A.C.G.B.I. pointed out that the tramcars travelled faster than ten miles an hour, and it was rather unfair that motor-cars should be made to go slower than these vehicles, which were owned by the municipality itself. The maximum speed on the Leeds tram lines was 18¾ miles per hour, not very different to the legal speed limit so far as motor-cars are concerned.

Cordingley's Motor-Car Exhibition.

"WE beg to call particular attention to this exhibition, which opens at the Agricultural Hall, London, on March 18th, and closes on March 25th," says "Bicycling News." Our contemporary continues:—"This will be the tenth show Mr. Cordingley has held, and the nine preceding ones have been so excellently managed, and so much business has been obtained at them, that the prediction of success and satisfaction for exhibitors and visitors alike may be quite a confident one. The proprietor is certain of a fine show, as much of the space has already been let, though there are still some vacancies in the gallery, which should be applied for at once. Mr. Cordingley claims that his show will be, as it always has been, the largest exhibition held outside Paris, and his enterprise and capital management will, we hope and feel sure, bring him the success that he deserves. The show is always a most popular one in London, and with motoring of all kinds coming on literally by leaps and bounds, the attendance, interest in the exhibits, and business done, are all likely to be good. Prospectuses may be had from Messrs. Cordingley and Co., 27-33, Charing Cross Road, London, W.C."

More Trials in India.

UNDER the auspices of the Automobile Association of Bengal, motor-car and motor-cycle reliability trials are to be held on the 9th and 10th prox. over suitable roads leading out of and returning to Calcutta, the total distance to be about 200 to 250 miles, and all cars and cycles will return to Calcutta each night. Cars and cycles will be locked up for the night, and no repairs or renewals will be allowed between the time of stopping the engine on completion of the first day's run and the time of starting on the second day. Motor vehicles will be classified as follows:—Class A, for cars costing over £400 in England; Class B, for cars over £200, but not over £400; Class C, for cars costing £200 or under; Class D, for bicycles with or without fore cars or trailers and tricycles. All cars must be fitted with *bona-fide* touring bodies and silencers. A prize or prizes will be given in each class for reliability, economy in fuel consumption, and general condition after the trial, according to the number of entries. Should there be sufficient entries a consolation prize will also be given. No prize will be given in any class unless there are seven starters representing separate interests. H.H. the Maharaja Kumar Tagore has kindly offered a cup, valued at about Rs. 1,000, for the most reliable car in Classes A, B, and C. The judges in connection will be appointed by the Committee of the Automobile Association of Bengal, and the competing cars must be driven at ordinary touring speeds.

◆ ◆ ◆

The Races in France.

THE formal protest of the A.C.G.B.I. against the concurrent running of the Gordon Bennett race and the Grand Prix has been forwarded to the French Club. It is on the lines of the resolutions of the committee published in last week's *Journal*. While the committee wish to uphold and support the French Club in every possible way in connection with some such race as the Grand Prix, they feel that it should not be allowed to interfere with the running of the Gordon Bennett race by being run over the same course and on the same day, and necessarily, therefore, seriously affecting the issue. The committee consequently point out that a trophy of such historic fame as the Gordon Bennett Cup should remain the blue ribbon of automobile sport, as it must not be forgotten that it is largely due to the generosity and forethought of Mr. Gordon Bennett in offering such a cup that automobilism has reached its present state of high efficiency, both from the commercial and the sporting point of view. Further, the committee protest most strongly against the new race having been instituted, and conditions formulated, after the entries for the Gordon Bennett race had been received and accepted.

THE German Government has just presented a Daimler 5-ton motor-wagon to the King of Abyssinia.

A SIGN of the times may be fairly gauged by the interest motor-car builders take in anything new introduced relative to improvements in tyres tending to prolong the life of same, and thus reduce the cost of the tyre and repair bills. This was clearly shown last week by the large number of callers at the Hotel Cecil to inspect the new Swinehart-Clincher "concave" type of tyre, for which a life of 7,000 to 8,000 miles is guaranteed by the makers when running over ordinary roads. In order to secure resiliency, the new tyre is made concave, so as to be springy when running over rough roads, and has already been adopted by the Oldsmobile Company, of America, for use on their 1905 touring cars and parcel delivery vans. We learn that Messrs. Shippey Brothers have been appointed sole importing agents for the new tyre, and that arrangements have been made with Messrs. Smith, Parfrey, and Co. to build artillery wheels of any diameter and type of hub to suit the same.

MOTORING IN CANADA.

ALTHOUGH Canada has not yet come prominently into the motoring world, it has been quietly developing an interest in automobilism that proves the capacity of the Canadians for being in the fore-front of American progress.

The interest throughout the Dominion may not be quite widespread as yet, but in the leading towns, such as Toronto, Montreal, Ottawa, London, Winnipeg and Hamilton, enthusiastic motorists are already banding together in clubs and organisations similar to those which have sprung up in the old country during the last few years, and in all the cities we have named some organised meet of the Automobile Association has taken place during the year that has just closed.

At Ottawa there are at least two well-equipped garages, generally filled with motor-cars belonging to residents of the city and district. It is remarkable that apparently at present the motorists have largely made use of these garages rather than have the cars in private establishments of their own, but of course this is merely a transient stage, and a few months' further experience will lead to the demand for motor houses in connection with the residences of Canadian folks as well as motorists here at home in England.

Already the people of the larger cities recognise that the adoption of the motor-car in the comparatively early stage of their history may do something to prevent the over-crowding and congestion which have become the features of older towns that have developed, reliance being placed upon the railroad only for the transport of the population from work to home. Public men are dwelling, in their speeches, upon the need for watchfulness with a view to encouraging any efforts to establish motor-car services with the object of dispersing the working-class population into the suburbs. Despite the progress of the electric tram system, there seems to be a good chance for successful development in that direction.

By the courtesy of the editor of the "Agricultural Economist" we are able to give a photograph of the joint meet of the Automobile Clubs of Toronto and Hamilton, which was held recently to celebrate the re-making of roads. An association has been formed locally to develop an improvement in the roadways, and a scheme has been devised by which the county authorities will provide two-thirds of the needed outlay, the central Dominion Government giving the other third.

The first road to be made under this scheme is shown in the illustration, the opening being made the occasion for a procession of cars, in which the public authorities and officials were taken a trip over all the principal roads in the locality by the owners of motor vehicles.

Mr. S. O. Greening is the president of the Hamilton Automobile Club, and he, with his committee, are to be congratulated on the good feeling which evidently exists between the motorists and the authorities in that colony—a good feeling which has been engendered by the toleration of the latter and the common sense of the former.

The example thus established by the Dominion Government in connection with Hamilton is inciting other local authorities to improve the main roads between leading towns, and when the movement thus extending gets in full swing, the motor-car will do much to promote touring in the Dominion. Not only that, but great interest is being taken in the heavier classes of automobiles, and nowhere through the British possessions is the development of heavy motor traffic in the old country being so closely watched as in Canada.

Motoring in Canada.—The Joint Meet of the Toronto and Hamilton Automobile Clubs.

In the larger towns steam and electrical vehicles were formerly practically the only automobiles seen in the streets, but petrol cars have now established themselves in the Dominion, and agencies for British vehicles are being sought by Canadian agents.

At Toronto a series of twenty lessons on the operation and construction of automobiles is now being given by Dr. P. E. Doolittle, the president of the Automobile Club there. The doctor is one of the pioneer motorists in Canada, and in 1896 he attended the run to Brighton to celebrate the emancipation of British automobilists from the "Red Flag Law." In 1902 he attended the anniversary meet at Oxford, so that he has acquaintance of the movement in the Old Country as well as in Canada.

POST OFFICE MOTOR MAIL VANS.

FOR some time past Messrs. McNamara and Co., the mail van contractors to the G.P.O., have been using a couple of motor-vans of a new type, of which we are now able to publish illustrations, together with a brief description. The vehicles are of German construction, having been built by the Berlin Motorwagen Fabrik, of Tempelhof, Berlin. The motive power is supplied by a horizontal engine located in the fore part of the channel steel frame; the cylinder is 120 mm. bore by 180 mm. stroke, and at a normal speed of 800 revolutions per minute the engine develops 7-h.p. The mixture is furnished by a special form of carburettor which, after the engine is started on petrol, is claimed to be able to vaporise ordinary petroleum. The usual type of high tension ignition is adopted. Two speeds forward and a reverse are provided, the transmission being by means of a single wide belt working off a wide pulley on the engine shaft on to either of three pulleys on a counter-shaft at the rear, the free engine being obtained when the belt is slipped on to the central loose pulley. The rear axle is of the "live" type, the power being transmitted from the pulleys to the axle through gear wheels enclosed in the differential case. The makers claim that the belt has proved a most satisfactory medium for transmitting the power on account of its being elastic and allowing the driver to vary the speeds at will without giving any shock to the motor. In case of stretching of the belt, the rear axle is fitted with a pair of special tighteners, and by moving a screw the whole axle can be moved backwards so that the belt may always have the necessary tension. The van is designed to carry loads of from 15 cwt. to 20 cwt. at speeds up to twelve miles per hour. The body, as will be seen from Fig. 2 (page 973), is made with hinged rear doors and top, so that it can be loaded with mail bags in a minimum of time. The road wheels are 32 in. diam. at the front and 38 in. at the rear, and are shod with solid rubber tyres.

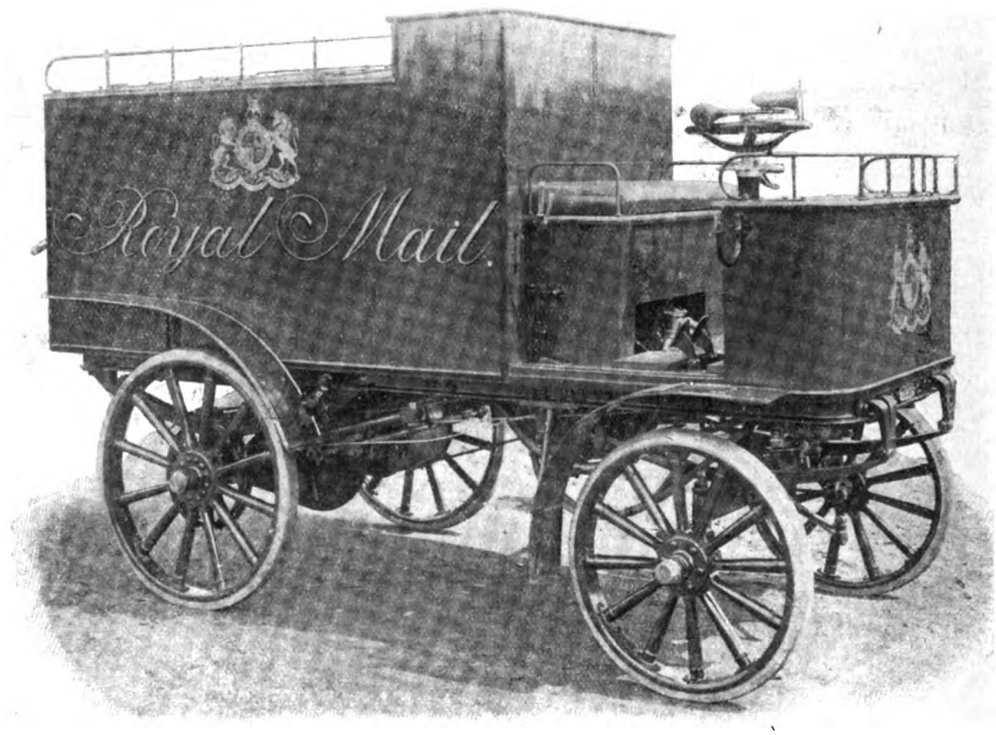

Fig 1.—General View of Van.

In our report of the Paris Exhibition reference was made to a new combination petrol-electric car (Gasnier's patents), exhibited by Messrs. Sage and Co., of Paris. We learn from Messrs. Delamotte and Foster that these cars will be shortly placed by them on the British market.

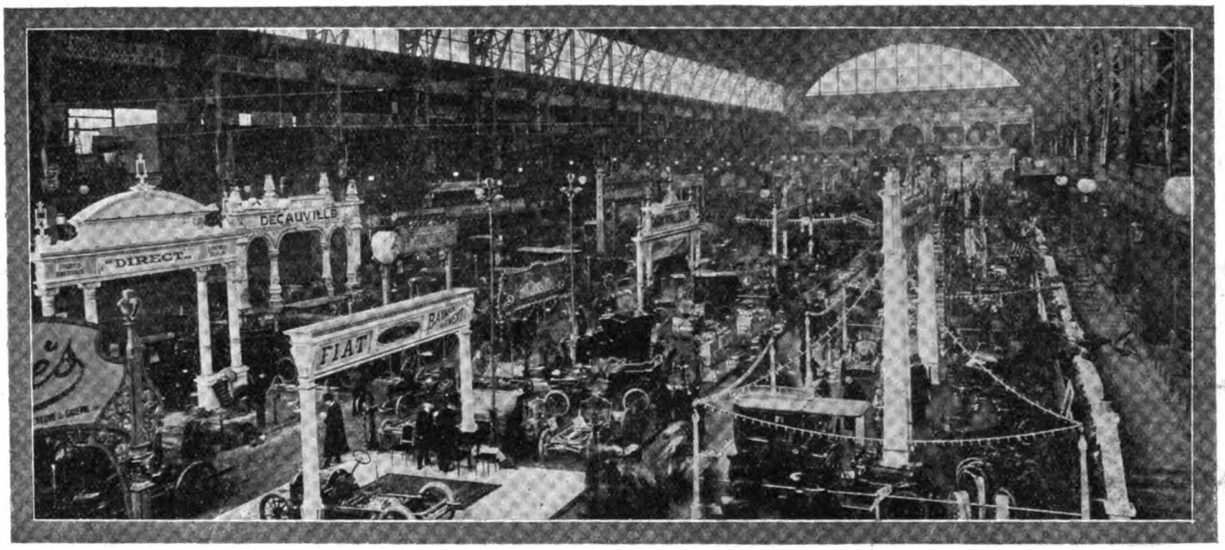
CONTINENTAL NOTES.

The Gordon Bennett and Grand Prix Races.

The Sporting Committee of the A.C.F. has definitely decided that the Gordon Bennett and Grand Prix races shall be run concurrently, the probable date being July 5th. It appears, however, that their recommendation to the Committee of the A.C.F. is not that forty-two cars shall be allowed to compete in the Grand Prix, but that the number of cars in the joint race shall be limited to that number, the proposed allocation of entries being as shown below:—

	Cup Race.	Supplementary Invitations.	Total in Grand Prix Race.
France	3	12	15
Germany	3	3	6
England	3	3	6
Italy	3	0	3
Switzerland	3	0	3
Austria	3	0	3
America	3	0	3
Belgium	0	3	3
	21	21	42

The twelve French invited cars will be those which are classed in the Eliminating Contest after the first three. The decision of the French Club to restrict entries in the latter to three cars of one type, even if made by different firms, is to be extended to the Grand Prix. In cars built in the same country this ruling will not create difficulty, but it is otherwise when the cars of identical design are of different nationality, as in the case of the German and Austrian Mercedes. For the Gordon Bennett race Germany can enter three Mercedes, and Austria also three, but for the Grand Prix only three Mercedes cars in all can be entered. The subject is still the chief topic of conversation in French motoring circles, and, in view of the protest sent in by the British Club, the result of the meeting of the A.C.F. committee is anxiously awaited.



◆ ◆ ◆

The Belgian Salon.

The fourth annual Belgian *Salon* was opened in the Palais du Cinquantenaire, Brussels, by King Leopold on Saturday last. Following so soon after the show in Paris, the display appears a small one, but it marks a progress for Belgium. Among the

Digitized by Google

native firms exhibiting cars are the Pipe, Bovy, Vivinus, La Metallurgique, Excelsior, La Locomotion (Rochet-Schneider licence), Dasse, Linon, Mecanique et Moteur, Minerva, Direct, Mathieu, De Cosmo, and Germain concerns. A noteworthy stand is that of the last-named company, represented in England by Mr. Theo. Masui. On it is shown a 24-h.p. *chassis;* in its main features the 1905 type is similar to that of last year, the only important change being the adoption of the stamped steel frame. There are also a number of minor improvements, which will all assist in maintaining the reputation of the Germain car. Of the complete vehicles, the most noteworthy is a Limousine with six inside seats, on an elongated 24-h.p. *chassis*. The body work is by the well-known Belgian carriage builder, Van den Plas. French makers are well to the fore, among the types on view being the Aries, C.G.V., Automotrice, Berliet, De Dion, Clement-Bayard, Panhard, Darracq, Decauville, Delaunay-Belleville, Fouillaron, Renault, Rochet-Schneider, Gregoire, Hotchkiss, Mors, Radia, Richard-Brasier and Unic. The Mercedes, Neue Automobile Gesellschaft and Benz companies represent the German motor industry; the Fiat Company that of Italy; Spyker, Holland; and the Oldsmobile, the United States. It has unfortunately to be said that no English vehicles are on view. In the gallery a number of non-skid bands are to be seen, including the Samson,

General View of the Belgian Automobile Exhibition.

Houben, and Desclée. Among the novelties is the "Amans" anti-shock device, introduced by M. Albert Mans, of Dieghem, designed to fulfil the same purpose as the Truffault arrangement used on Peugeot and Richard-Brasier cars. The show will remain open until the 26th inst.

◆ ◆ ◆

Heavy Oil Fuel Competitions.

In the early part of August next "Les Sports" will hold a trial of industrial vehicles, the engines of which use ordinary petroleum, naphthalene, shale oil, or other heavy oils as fuel. The test will consist of a run from Paris to Rouen and back, the route including the well-known Gaillon Hill.

◆ ◆ ◆

The Progress of the Mechanically-Operated Inlet Valve.

M. Lucien Perissé, in continuing his interesting technical statistics of the recent *Salon* in Paris, in the "Auto," takes up the question of the mechanically operated inlet valve, and shows that while at the 1902 Exhibition only 45 per cent. of the petrol engines displayed were fitted with these, the proportion at the Show lately closed was no less that 97 per cent., leaving only 3 per cent. of engines with the ordinary suction valve. It is also interesting to learn that of the motors fitted with M.O.V. 66 per cent. have the inlet and exhaust valves arranged on opposite sides of the cylinders, and operated by separate cam shafts, 24 per cent. have the valves arranged side by side and actuated off a single half-speed shaft, the remainder having the inlet valves located in the cylinder heads worked by rods and tappets.

◆ ◆ ◆

The Scheldt Motor-Boat Race.

At the meeting of the Belgian Automobile Club last week it was decided that the contest for the Coupe Auto-Nautique de l'Escaut should consist of a race from Antwerp to Flushing and back. The decision has not met with universal approval, as at Flushing there are occasionally heavy seas which will be unpleasant to the owners of some of the smaller craft.

◆ ◆ ◆

Public Services in Germany.

A service of electrical omnibuses, supplied with current from an overhead conductor, has lately been started between Nieder-Schöneweide and Johannisthal, near Berlin. At Estenfeld a company has been formed to establish a public service between Wurzburg and Bergtheim; three journeys per day in each direction are to be made.

◆ ◆ ◆

The Nice Week.

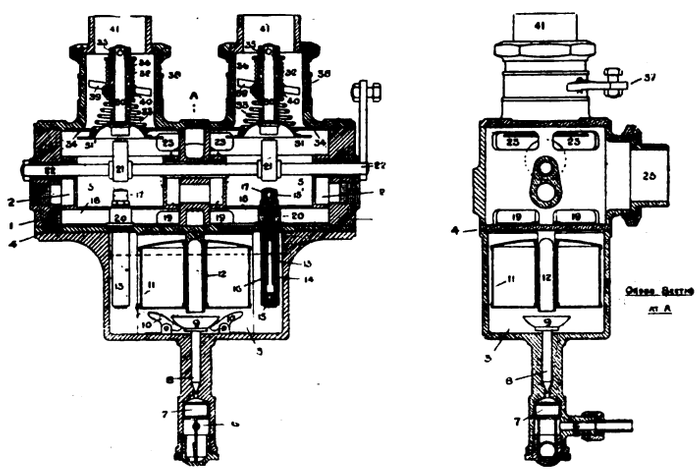
It has now been decided that the Nice automobile week shall be held from the 14th to the 23rd April. The first two days will be devoted to a trial of touring cars, on the 16th there will be a flower fête, and on the 17th a series of standing mile and flying kilometre contests for the Rothschild cup, these taking place not on the Promenade des Anglais, as usual, but on the National Road near Antibes. The Coupe de Caters event will be held on the 18th, and the Coupe Provinciale on the 23rd.

◆ ◆ ◆

Motor Racing in Holland.

It is probable that an automobile fête will be held at Scheveningen, the well-known Dutch seaside resort, during the coming season. As items in the fête it is proposed to organise a series of mile and kilometre speed trials.

◆ ◆ ◆



An Austrian Touring Competition.

The Sports Committee of the Austrian Automobile Club at its last meeting decided to organise a touring and reliability competition during May next. The trial will be restricted to petrol cars, which will be divided into a number of categories. The distance to be covered will be between 600 and 800 kilometres, and points will be awarded for regularity of running, average speed, consumption of fuel, speed on the level and on hills, the frequency of cooling water renewal, freedom from tyre troubles, carriage work, and the price of the *chassis*.

THE NEW ARGYLL CARBURETTOR.

THE Hozier Engineering Company, Ltd., have adopted a new carburettor on the 1905 models of their Argyll 10-12-h.p. double-cylinder cars. Two sectional views of the apparatus, which has been devised by Mr. F. H. Smith, are given herewith, from which it will be seen that the chief features are the positive feed of the petrol and the arrangement employed for governing. One float chamber 3 is employed, in which the petrol stands at about the level of dotted line. A small petrol pump is provided for each cylinder, and in each induction pipe is placed a governor of the inertia or difference of pressure type. The action of the carburettor is as follows:—Petrol flows in from the supply tank through pipe 6, and is filtered upwards through a strainer 7. The latter can readily be taken out and cleaned by removing the screwed cap below it. An arrangement of float and needle valve is employed to keep the petrol at the level of the dotted line in the float chamber. Projecting downwards into this chamber are the petrol feed pump barrels 13, which work the plungers 14. When the piston moves forward on the suction stroke it creates a partial vacuum in its cylinder and in its induction pipe 41. This causes a rush of hot air along the pipe 23, through ports 19, up through holes

Sectional Elevations of Carburettor and Governor as fitted to 10-12-h.p. Argyll Cars.

in the disc 18, which is fixed to the pump plunger 14. This plunger has at its lower end a ball suction valve 15, and at its upper end the delivery valve 15^1. The lifting of the disc 18, due to difference of pressure of air on its two sides, raises the pump plunger, which in turn discharges the petrol from the annular space 16 through the valve 15^1 and spraying nozzles in the cap 17. The quantity of petrol per induction stroke of piston is thus determined by the cubic contents of this space, and this quantity once correctly determined for an engine, and the spirit employed, does not, the makers state, need and ought not to be varied. In order to allow of adjustment when fitted, or to suit another spirit, cams 21, actuated by a shaft 22, are provided. These cams form stops, and determine the maximum lift of the pump plungers, and therefore the maximum quantity of petrol that can be pumped per suction stroke. A fibre buffer 20 brings the plunger to rest on its downward movement. The mixing chambers 5 are each directly below their respective induction pipes, and are warmed by hot air or water circulating in the jacket 2.

In each induction pipe 41 is placed a separate governing device; this consists of a spindle 30 carrying a disc valve 31, held from its seat 34 by a series of springs 33 and 36. In order to follow the action of the mechanism, it is necessary to note that when the piston moves forward in its cylinder it tends to form a vacuum behind it, into which the air from ports 19 and 23 rushes. When the speed is low the air keeps pace with the piston, and there is little vacuum formed; when, however, the piston speed increases, the air is less able to flow in fast enough, and a partial vacuum is formed. Now, as soon as this vacuum—or rather the difference of pressure on the two sides of the valve 31—is sufficient to overcome its inertia, and counterbalance the pressure of the springs tending to keep it open, the valve 31 will close on its seat, cutting off the supply of mixture. Once it has closed it cannot open again during that suction stroke, as the further movement forward of the piston in the cylinder only tends to increase the vacuum, and hold it the more tightly shut. The effect of this cut-out action is analogous to that of a trip gear on a steam engine—only a certain definite quantity of explosive mixture has been allowed to pass to the cylinder to do work. When, however, the speed at which the governor is to act is not exceeded the valve never closes, and the piston draws in its full supply of air, charged with its accurately measured quantity of petrol.

In order to be able to control the speed at which this governing action begins, use is made of the throttling action of the valve 31. It is clear that if the valve be opened fully the air will pass freely into the cylinder, and there will be little or no difference of pressure on its two sides to tend to close it. If, however, it be not quite so fully open, there will be a greater resistance to the flow of air and a greater difference of pressure, consequently a lower engine speed will be sufficient to create sufficient vacuum to make it close. An arrangement is therefore provided for varying the lift of this valve off its seat, controlled by a lever on the steering wheel of the car. This consists of the lever 37 operating the sleeve 38, a pin in which passes through a slit, of the form of a portion of a screw thread 39. This pin engages with a groove in the collar 40, on the valve stem. A movement of the lever 37 therefore changes the amount by which the valve can open, and, in consequence, the speed of the engine at which the governor will begin to act. The levers 37 on each governor are coupled up to a common rod, so that each engine is cut out at the same speed.

Among the advantages claimed for the apparatus are that it does away with the necessity for a centrifugal governor and its control, and prevents a change of level or jolting of the car affecting the working of the engine, as under all and every condition the correct mixture is sent to the cylinder. The governor arrangement acts very quietly and with certainty, and is exceedingly sensitive, while there is no difficulty in "picking up" the positive feed of the petrol, ensuring the supply however rapidly the change of speed may be effected. An important advantage is the increase of power and decrease of petrol used, it being claimed that from 25 per cent. to 35 per cent. further can be travelled on the same quantity of spirit than with the usual spray carburettor and centrifugal governor. Another feature is that ordinary paraffin can be used quite well, owing to the positive feed and method of mixing with the air.

THE annual general meeting of the Yorkshire Automobile Club will be held on the 26th instant at Leeds.

MESSRS. H. M. HOBSON, LIMITED, have been appointed sole concessionnaires for the United Kingdom and Colonies for the Decauville cars.

THE two cars which the Wolseley Company are building for the Eliminating Trials for the Gordon Bennett team will be of 100 h.p., with frame of steel channel section. The wheelbase will be 9 ft. and the track 4 ft. 7 in.; rear wheels will be 36 in. dia. with 5 in. tyres and the front wheels 34 in. by 3½ in. The motor will comprise four horizontal cylinders in line. There will be four speeds forward and one reverse, the transmission being by Renold silent chain to the gear box, and from the differential to the rear road wheels by side chains. One of the cars will be driven by Bianchi, the driver of the second vehicle has, however, not yet been selected.

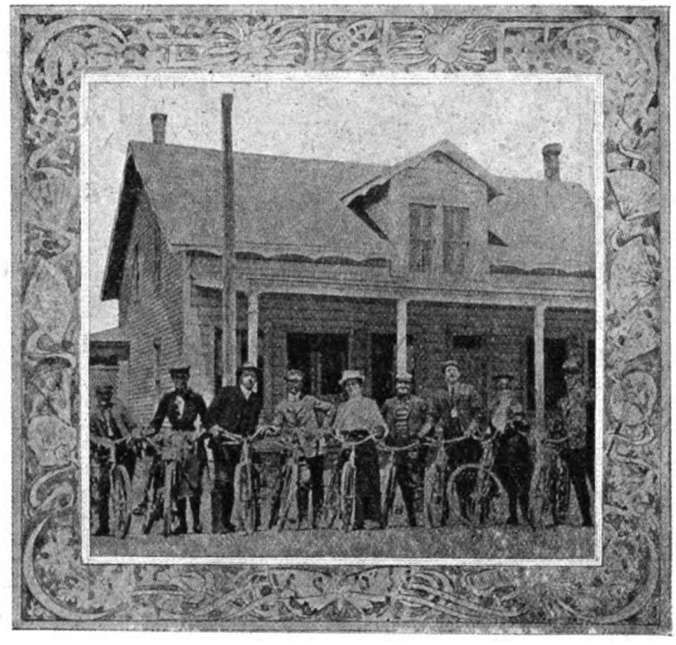
"PETROL MOTORS AND MOTOR-CARS." *

IN his preface the author states that "though many works exist on the subject of internal combustion engines, which contain practically all that is known about them, it is thought that there is no book written entirely from the designer's point of view. The present volume is intended to provide designers and draughtsmen with reliable formulæ and information in a readily accessible form." The book is divided into two parts, the first being again subdivided into two sections. One of these is concerned respectively with four and two cycle engines, symbols and definitions, cylinder design, valves, details of motors, balancing, carburettors, governing, ignition, general design and cooling. In the second section the author deals with transmission, friction clutches, gearing, brakes, ball bearings, and carriage springs. While much useful information is given in both sections, we are somewhat afraid that the designer of motor-cars will not altogether find the work to thoroughly meet his requirements; for, while many details of the petrol motor are fully dealt with, there are other parts which are untouched. For instance, we look in vain for some indication as to the most suitable grade of iron of which to cast the cylinder, for information as to the correct form of cam for operating the valves, and also some indication as to the method of timing the ignition and most suitable diameters of inlet and exhaust pipes. We should have liked, too, to have seen included a brief outline of the method of testing the horse-power of petrol engines. The portion relating to the design and form of inlet and exhaust valves appears to be comprehensive, as is also that relating to the important question of balancing. In the section devoted to the transmission portion of the vehicle, the subject of gear wheels is exhaustively treated. On the other hand, several of the other matters dealt with might have been expanded with advantage; thus the author's remarks relating to change-speed gears of the train-balladeur type might have been amplified by giving the dimensions of the various pinions used in the change-speed gear of any of the best known of modern cars. In the section devoted to driving chains, space is wasted in giving the formula for designing sprocket wheels for chains of the block type, which the author himself admits in the preceding sentence are not now being much employed, while in giving the dimensions of block chains on pages 104 and 105 he omits to mention that those quoted relate to chains of one inch pitch, and not to chains of larger pitches. Carriage springs are briefly dealt with in the final chapter, but the subjects of axles, differential and steering gears are not touched upon. A third of the book is devoted to an Appendix, in which are given a series of useful tables; but, as these are to be found in any engineer's pocket-book, it is difficult to see why so much space should have been devoted to reproducing them. A good feature of the work is its well-compiled indexes, both to the subject-matter and the formulæ. Taken as a whole, however, it will be seen that we are somewhat disappointed with Mr. Hyler White's book, which, while useful so far as it goes, only partially meets the requirements of those for whose benefit it was written.

A LICENCE has been taken out for the sale of motor spirit from the depot of the United Motor Industries, Limited, at Gosford Street, Coventry.

MESSRS. R. REYNOLD JACKSON AND CO. have completed a contract with Messrs. Trackson Brothers, Limited, of Brisbane, Australia, for the supply of Jackson dogcarts fitted with kerosene oil carburettors, for the whole of Australasia for three years. Arrangements are pending with another firm for the sole agency in India.

* "Petrol Motors and Motor Cars." A Handbook for Engineers, Designers, and Draughtsmen, by T. Hyler White, A.M.I.M.E. London: Longmans, Green and Co. 4s. 6d. net.



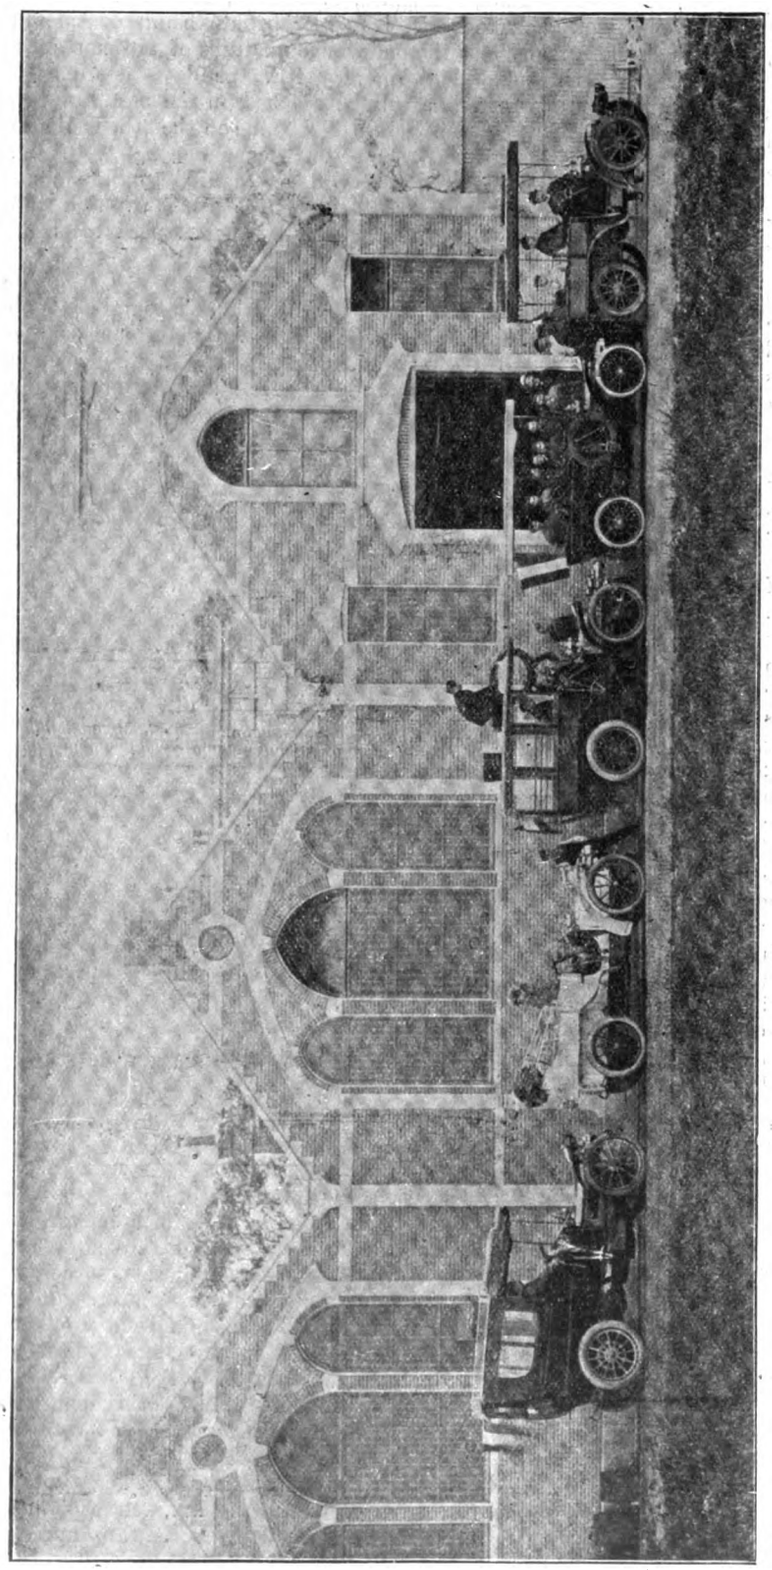
MOTOR CYCLING NEWS.

THE motor-cycle reliability contest which is being organised by the Autocycle Club de France is to be held in May next, over a course starting from Paris, and taking in Dijon, Lyons, St. Etienne, Avignon, Marseilles, Narbonne, Toulouse, Limoges, Orleans, and back to Paris, last year's route being considered too short to really test the endurance qualities of the machines. The start will take place on May 4th, the day's destination being Dijon. St. Etienne will be reached on the 5th, Avignon on the 6th, Marseilles on the 7th, Narbonne on the 8th, Toulouse on the 9th, Limoges on the 10th, Orleans on the 11th, and Paris on the 12th May. Points will be awarded to those competitors covering each stage within the time allowed, and during the trial a series of mile and kilometre speed tests, on the level and on hills, will be held.

◆ ◆ ◆

THE motor-cycle section of the Austrian Automobile Club has decided to give the first place in the Austrian team for the 1905 International Motor-cycle Cup race to the Laurin-Klement firm, which ran two machines in last year's race. An eliminating contest is to be held to select the other two members of the team

◆ ◆ ◆



A Motor-Cycle Meet in California.

◆ ◆ ◆

THERE was a gathering the other night of members of the Coventry Motor-Cycle Club at the Railway Hotel, Coventry, the occasion being the first annual dinner of this successful organisation. Gracing the table was a valuable challenge trophy, won by the club last season in a hundred miles non-stop run, open to the clubs of all England. The winning team consisted of Messrs. R. W. Ayton, H. W. Duret, A. Riley, B. H. Owen, S. Wright, and Bert Yates. Medals won in other contests arranged by the club were presented to Messrs. E. W. Walford and H. W. Duret. The president, Colonel Wyley, having proposed the toast of "The King," submitted that of "The winning team," which, having been enthusiastically drunk, was responded to by Captain Duret, who remarked upon the appropriate nature of the win of the Coventry Club, having regard to the encouragement which that town had given both to cycling and to motoring.

THE ANGLO-FRENCH AUTOMOBILE SYNDICATE, LIMITED, has been registered with a capital of £1,000.

A Fleet of Peugeot Cars employed in the recent Dutch Manœuvres leaving the Depot of Messrs. Verwey and Lugard at the Hague.

SOME USEFUL NOTES.

MOTOR-CAR chains are required to perform their functions under more adverse circumstances than any other part of the mechanism of a motor-car. They are exposed to the grinding action of mud and grit, and conditions are such that proper lubrication is a difficult matter. If a large amount of lubricant is externally applied, it serves only to collect dust and grit, and soon becomes a destructive agent rather than a preventive of wear. On the other hand, lack of lubrication is nearly as bad, for rusting may then set in, and the resulting wear would be nearly as great.

◆ ◆ ◆

To prevent wear, or stretching, as it is popularly termed, as much as possible, the chains should be frequently removed and thoroughly cleaned, by first placing them for a time in a bath of paraffin, and then going over them carefully with a brush until all traces of grit are removed. When perfectly clean, it is well to allow them to hang for a little time to allow the paraffin to drain away, and then they should be immersed in a bath of warm melted tallow mixed with a little graphite. The chains should be left in this bath until they and the tallow become cold and form practically one solid mass. The chains may then be removed and all surplus tallow wiped off with a cloth. This operation impregnates all the bearings of the chain with a good lubricant, which stays in place and prevents mud from working in between the wearing surfaces. Instead of making the tallow-graphite mixture himself, the motorist can buy such chain lubricants already compounded.

◆ ◆ ◆

ANOTHER matter of importance in the care of chains is to keep them at the proper tension. Too great a tension not only increases wear between the various parts of the chain itself, and between the chain and sprockets, but also causes a greater loss in the transmission of power and greater wear in the sprocket bearings. A slack chain is, on the other hand, likely to climb the sprocket or to jump off under sudden shocks. The proper tension is that which will hold the chain between the two chain wheels in two straight lines without sag, without bringing a greater strain upon the bearings than is necessary to accomplish this.

◆ ◆ ◆

IT should be kept in mind that as a chain wears, its "pitch" varies, and in time a tendency to "ride" the teeth of the sprocket chain wheel develops. This increase of "pitch" increases the amount of wear on the sprocket teeth, and, as a result, when replacement becomes necessary, a new chain will not fit perfectly, and it will be more difficult to make it run quietly. It will be necessary also to use it under greater tension to prevent its jumping off, and this in turn will result detrimentally as described above. It is expedient, therefore, to replace chains before the sprockets show much sign of wear.

◆ ◆ ◆

ANOTHER cause for unnecessary wear in chains is failure to keep the sprockets in proper alignment. In cars fitted with side chains this condition may arise through the shifting of the axle sidewise under the springs, or the unequal length of the distance rods. Care should be taken in adjusting the chains to see that these rods are taken up or let out equally, so that each pair of chain rings revolves in the same plane.

◆ ◆ ◆

IT cannot too often be pointed out that novices in motor matters should be very careful to see that the ignition lever of their cars is retarded before they attempt to start the engine. Otherwise the nasty blow of a "back-fire" may be experienced.

Digitized by Google

HERE AND THERE.

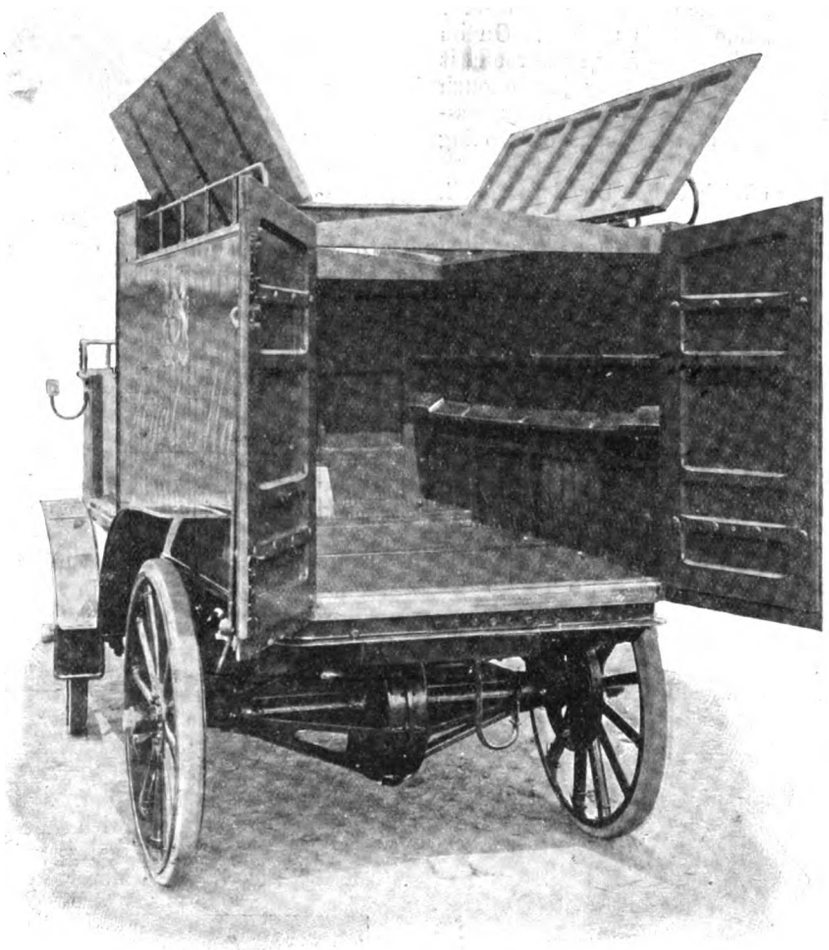
MESSRS. R. AND J. PULLMAN are bringing out a new non-skid band for motor tyres.

THE annual meeting of the Lincolnshire Automobile Club will be held on the 18th prox.

THE offices and showrooms of the United Motor Industries, Ltd., are now installed in the new premises, 45 and 46, Poland Street, London, W.

HIS Excellency Sir Reginald Talbot, Governor of Victoria, has purchased a 14-h.p. Talbot car from the agents of Messrs. Clement-Talbot, Ltd.

AFTER an extended tour in Australia, General Booth, of the Salvation Army, hopes to go on another motor tour campaign in the Old Country.



IT is possible that the Anglo-French cross-Channel motor-boat race may finish this year off Gravesend instead of off Dover.

A STOCK of Brampton's motor-car chains is now being kept by Messrs. Montague Hawnt and Company, of Clerkenwell Road, London, E.C.

THE Great Western Railway Company have commenced a motor-omnibus service between their station at Stroud and Painswick, to be run in connection with the London trains.

CAPTAIN MITCHELL-INNES, the Chief Constable of Lincolnshire, has been making a complete tour of the county on his motor-car, visiting every married constable in the rural districts.

IN the report of the Societe des Ateliers Germain, of Monceau, Belgium, for the last financial year, reference is made to the steady growth of the automobile department of the works, which during the twelve months turned out cars to a net value of £51,550, an increase of £5,100 over the preceding year.

The G.P.O. Mail Van. (See pape 968.)

THE WOLSELEY COMPANY have taken an order from the General Omnibus Company for six motor-'buses, which will commence service with them towards the end of March—about the time of opening the Motor-Car Exhibition at the Agricultural Hall, London. They are also building similar 'buses for the Great Western Railway Company and the Birmingham Motor Express Company.

A CORRESPONDENT who has run Collier tyres for fifteen months says the cost of running works out at, approximately, a farthing per tyre per mile. These tyres are of the large size, 36 in. by 4¾ in. by 5¼ in., and the car a 20-h.p.

ARRANGEMENTS have been made so that the members of the Ladies' Automobile Club can now have the same facilities for taking their cars abroad as have the members of the Automobile Club. The club triptyques will obviate the necessity of a wait at the French Customs.

MESSRS. JARROTT AND LETTS, LTD., are now fitting all the Oldsmobile cars with Continental detachable tyres.

MR. W. ACTON is the manager of the Motor Makers and Garage, Ltd., which has been established in the High Street, Epsom.

DR. PARKE, of Newtownards, Ireland, is one of the latest recruits to the ranks of motorists, he having just acquired an 8-h.p. Wolseley car.

MESSRS. J. KEELE AND COMPANY, 15, Priestwood Mansions, Highgate, N., have been appointed sole agents for London and South-East of England for the Spyker cars.

DR. W. R. ORMANDY, of Warrington, will give a lecture before the Western Section of the Scottish Automobile Club on Monday, the 23rd instant, on "Motor Fuels," with special reference to those of home and colonial manufacture.

THE municipal authorities of St. Louis, U.S.A., have voted a sum of £400 for the purchase of an automobile for the use of the chief of its fire department.

WE hear that a petrol motor on novel lines is about to be brought out by Mr. A. Burgess, of Saltley, Birmingham. The engine, which runs on ball bearings, is provided with a special form of carburettor and contact breaker, and among the claims made for the new motor are that it is extremely light and much less complicated than the usual type.

MR. J. D. BISHOP, motor-car agent, of Albert Street, Barrow-in-Furness, has sent us a sample tin of "Auto-Grindene," a preparation designed to do away with the trouble and inconvenience hitherto associated with valve grinding. A tin can easily be carried in the tool-box and is always ready for use, being invaluable when a valve has to be replaced on the road. It is supplied in two sizes—for motor-cycles and cars—that for the latter being in tube form.

THE WILTON COX DEVICE COMPANY are placing a detachable non-skid on the market. It has already been run 1,000 miles on a motor-car, and will be run a second thousand miles before the opening of the Birmingham Motor Show, where it will be on view. This non-skid is made in sections, any of which can be easily repaired and replaced when necessary. Instead of the tyre having the whole weight of the non-skid to carry, this is carried by the wheel, so that it practically supports the tyre. The studs are made of malleable iron and in two sizes—the larger one has a rounded top, so cast that it presents four corners to the road; the smaller one is so cast that it presents one point to the road, having the same effect as a horse when roughed for frosty weather. The whole of them are hand-riveted, and do not in any way come in contact with the tyre, as an extra pad of hide is placed at the back.

Digitized by Google

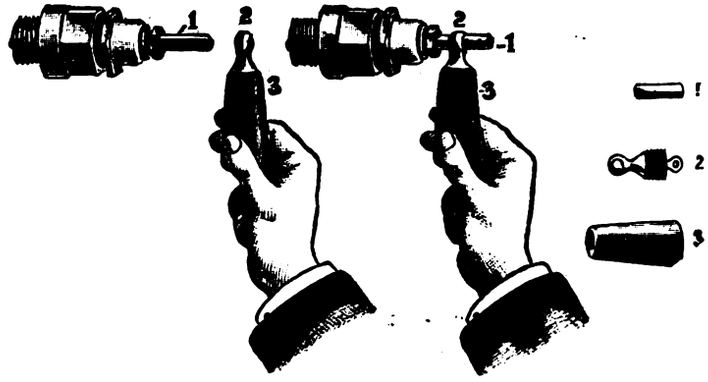
THE first automobile ever seen in Bogota, Colombia, made its appearance upon the streets of that city in October last, and created great excitement.

TYRE troubles were the principal cause of difficulties in the Delhi-Bombay reliability trial. The Thornycroft car, for instance, lost no marks except for tyre troubles, causing it to be unplaced in the list of awards.

A USEFUL little adapter for use in connection with acetylene lamps has been brought out by Mr. F. G. Milne, of Bensham Lane, West Croydon. It is intended for use in clearing out a choked burner, and, as will be seen from the illustration, consists of a little brass fitting which may be screwed on to the end of an ordinary tyre pump and to the burner, a stroke or two being sufficient to clear the obstruction.

IN a sketch at the Bedford Palace of Varieties, a 10-h.p. Peugeot car, supplied by Friswell, Limited, is utilised. On its exit from the stage, owing to there being so very little room, it has to climb a gradient of 1 in 4, and there is only just enough space to allow it to get through the wings; however, it successfully accomplishes the business, and is the means of evoking tremendous cheers.

AT a meeting of the Hampton Wick Urban District Council, a resolution of protest was unanimously passed with reference to the Parliamentary powers granted to the London United Electric Tramways Company to construct a double line over Kingston Bridge, the Council stating that the construction of tramway lines over the bridge was impossible, owing to the narrowness of the carriage way, and asking that the laying of lines should be deferred until the bridge was widened.



THE WESTERN MOTOR CO., LTD., has started business in Glasgow as motor-car agents. This company will handle the "Argyll" cars in Glasgow and the West of Scotland in a large showroom at 70, Buchanan Street, Glasgow. It is the intention to carry a large stock of cars and accessories suitable for all types of cars. A large staff of engineers has been secured for the execution of repairs, and by arrangement with the Hozier Co. the Western Motor Co., Ltd., will be enabled to secure the advantages of the use of their workshops and special machine plant for the repair of cars.

WE illustrate herewith an improved lubricating oil distributor lately introduced by the Coventry Motor Fittings Company.

The apparatus is arranged so that it can be fixed slightly above the dashboard, consequently the sight feeds are easily discernible, the light showing through the glasses. In conjunction with the lubricator a cylindrical oil tank arranged for pressure feed is supplied and is manufactured in two sizes to take approximately a half and one gallon of lubricating oil respectively.

A NEW sparking plug attachment and ignition testing device is one of the latest novelties to be introduced by Messrs. A. W. Gamage, Ltd. The device is built up of three parts:—(1) a small brass piece, which screws on to the outer end of the sparking plug; (2) another brass fitting, to one end of which the high-tension wire is attached, the other end

being in the form of a spring eye; and thirdly, an ebonite piece which screws on to the brass piece 2, so acting as a shield to the wire connection. Referring to the illustration it will be seen that to attach the wire to the plug it is only necessary to push the spring eye over the brass piece on the end of the plug. To test the ignition the spring eye piece can by means of the ebonite shield easily be pulled off and held a short distance away from the end of the plug. The device is made to suit a wide range of different plugs, and enables the attachment to be made without the use of any tools.

MESSRS. PETER LEE AND SONS, of Glasgow, have been appointed wholesale agents for Scotland for the sale of "Shell" motor spirit, the importers of which, the General Petroleum Company, Limited, have erected large stores in Glasgow, where sufficient stock is held to supply motorists in Scotland.

THE value of the motor-cars and parts exported from the United States during November last is returned at £21,223, as contrasted with £21,504 in the corresponding month of 1903. For the eleven months ending with November, the shipments attained a total of £336,598, comparing with £283,896 in the first eleven months of 1903.

THE NEW ERA MANUFACTURING COMPANY are bringing out a petrol extinguisher, specially adapted to be carried on motor-boats, motor-launches, 'buses, vans, etc. The extinguishing solution is a secret process, and experiments have demonstrated the merits of the invention.

WE illustrate herewith a new combination detachable non-skid band and tyre gaiter which has lately been brought out by the Glasgow Motor Tyre Company. It consists of a substantial piece of chrome leather, backed with canvas and fitted with three rows of solid steel studs; the gaiter is provided with straps so that it may be attached to three of the spokes of the wheel, rendering it impossible for it to move. The makers claim that four of the gaiters on each wheel make a perfect non-skid. It is not necessary to deflate the tyre in order to detach the gaiter, whilst it will be readily observed that the gaiters can be used in case of a burst tyre.

FROM the Walter Scott Publishing Company, Ltd., comes a useful little volume on petroleum, by Mr. S. H. North, in which the history of petroleum, from its place in the oil-fields to its transport and storage for commercial purposes, is traced with knowledge and clearness. A slight chapter dealing with oil for motors mentions the views of Captain Longridge with regard to Russian and American oils, and also gives the result of experiments made by the Automobile Club of France with regard to the densities of spirit and the power obtained.

CORRESPONDENCE

[*Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.*]

THE USE OF THE ACCELERATOR—HAND v. FOOT CONTROL.

To the Editor of *The Motor-Car Journal.*

Sir,—We have followed this discussion with much interest. In our 1904 Motobloc cars we fitted a foot accelerator, but found that the vehicles were rendered far more handy by the addition of a hand control, which we fitted for most of our clients. In our 1905 types we are adopting hand control only; the lever is mounted on a quadrant on the steering wheel, and is arranged so that it can be regulated by the thumb without removing the hand from the wheel; certainly the hand control is capable of far finer regulation, and our experience is that the average driver has sufficient occupation for his feet in managing his clutch and brake. We have lately been experimenting with an automatic cut-out in conjunction with the clutch pedal and have now a car fitted with a very simple attachment.—Yours truly,

Montague Hawnt and Co.

TROUBLE WITH DIFFERENTIAL GEARS.

To the Editor of *The Motor-Car Journal.*

Sir,—My experience with the above may be interesting to your readers, and at the same time it will be interesting to me to know whether others have met with similar experiences. My car is a 7-h.p. Allday and Onions, to seat three, purchased last August. It has been in daily use since purchased and has travelled over 2,000 miles without any mishap until last week, when I noticed difficulty in going round corners. Instead of taking corner sharply and well, the car would not go round except with a wide curve, taking the vehicle to the opposite side of road. At first I attributed this to possibly incorrect steering, and it was not until going down a narrow lane winding very sharply in the form of several S's joined together that it was forcibly impressed upon me that the differential was out of order. The hind wheels would not take the curves, and consequently the car gracefully glided into a ditch, out of which we could only extract it by the aid of a horse. When withdrawn from its miry bed and examined, I found the car had met with no damage, not even a scratch upon the paint, and I managed to complete my journey of ten miles further.

I have had the car examined by an expert, feeling confident that the trouble was as stated, and he found that of five wheels or cogs upon which the cardan shaft works, four had lost some of their teeth, some as many as a quarter of the number and other not so many, and the pieces of steel torn off had got fixed amongst the other cogs, with the result that the driving wheels were compelled to act together and not separately. Now I would like to know if this is a common accident with differential gear. If so, it must be a very serious obstacle to its being commonly adopted; or is it possible that the stripping of the cogs was due to faulty material? The makers in their description of the car state that all gears are made from mild steel forgings, accurately cut and, with the shafts, are case-hardened and afterwards ground to gauge. Is this metal strong enough to take so much work as is entailed upon it in the working of a car of this description or ought the metal to be of a harder nature? I must say that I am delighted with my car and the work it has done, but consider 4½ months a very short time for a differential gear to wear out, considering that the car has only travelled about 2,000 miles.—Yours truly,

Constant Reader.

TOURING IN FRANCE.

To the Editor of *The Motor-Car Journal.*

Sir,—If any readers of the *Journal* propose to tour in France during the coming season, it will be well to remember that you have to pay a duty on the car—approximately £1 per cwt. This money is, of course, returned when you leave the country. The Custom-house in France will only accept the duty in French money. This is one of the few instances where English gold does not carry one. It is always well to arrange about getting the necessary permits a month or two before leaving this country. The best plan is to write to the motor-car agent in whatever port you land and get him to arrange everything for you. I did this myself, and can recommend anyone to M. Sergent, 14, Rue Victor Hugo, Boulogne, whom I found most courteous and obliging.

There are two permits necessary—one is practically a licence for the car, the other, a licence to drive the latter, being only given after an examination is passed. The official who passes the car (and in most cases examines the driver), will either come to the place of landing, or one can drive to the Prefecture.

Petrol costs double what it does in England, but I think it is of far better quality, and consequently carries one further. Petrol, by the way, is called "essence" or "moto-naphtha" in French, the French word "petrole" denoting paraffin. It is as well not to mix them up. Speaking generally, one can drive infinitely faster in France than England, but caution should always be exercised in passing through villages. If one is driving a car which does not err on the side of heaviness, care should be taken of the little ditches (the French call them "caniveaux") which cross the road. They are usually near villages. If one is travelling at any speed at all, the car will leave the ground, and an axle may easily be bent in this way.—Yours truly,

C. A. R.

OVERHEATING TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—Perhaps some of your readers could help me to overcome the overheating troubles I have lately experienced in my De Dion motor. The pump throws a stream of water over 10 ft., but, nevertheless, after travelling about three miles at fast speed the engine invariably stops from overheating, though the water in the tank never boils. I have tried the following unsuccessfully:—(1) Complete repairs to pump; (2) new coil and auto-trembler; (3) new piston-rings; (4) scraping the radiator; (5) new joints throughout the circulation. The mixture is perfect, and so is the pump. I begin to think that the defect must be due to "furring" of the cylinder jacket, though only a thin coating of rust is visible.—Yours truly,

J. L. L.

["J. L. L.'s" trouble from overheating is most probably due to the "furring" of the water jacket, or, failing this, a stoppage in the return pipe from the radiator to the tank. This would cause steam to generate in the head of the jacket, and so in turn cause enough pressure to prevent the pump from keeping up the water supply. We should advise our correspondent, in the first place, to take off the cylinder, remove all the plugs, and scrape away all possible sign of furring, more especially around the valve chamber. In the event of this failing, the inside of the water tank may be found "furred" or choked around the return pipe from the radiator.

BRITISH METHODS.

To the Editor of *The Motor-Car Journal.*

Sir,—I should like to give my experience of British trading methods. On December 22nd I sent the two plugs belonging to my car to the maker, a well-known manufacturer of plugs, to be put right, as compression was leaking through the mica. I asked if they would kindly rectify or replace per return, as I wanted to use car for Christmas. I did not hear anything, so wrote again on the 27th or 28th ult. No answer. I wrote again on January 2; still no answer. On January 8th I wrote again, speaking sharply of their want of business etiquette. Received on January 10th, on a post-card, an acknowledgment of my letter, and promise to see into the matter On January 11th I received a letter, but am still waiting for plugs.—Yours truly,

Arthur C. Ashby.

PRIMARY BATTERIES FOR ACCUMULATOR CHARGING.

To the Editor of *The Motor-Car Journal.*

Sir,—I was much interested to see in your issue of January 7th two letters relating to the use of Boron cells. I have lately purchased a set of four to charge my accumulators, but am not altogether satisfied. The zincs seem to waste very quickly, although I have amalgamated them with mercury. I see both your correspondents say that if this is the case use less acid in the porous pot. I am told to use one part acid to twelve of water; is this too strong? For how long should the cells remain effective after being charged; I also notice that some of the zincs are coated with a thick white-looking substance, somewhat like moistened sugar to look at. What is the cause of this? Any information would be most acceptable to—Yours truly,

Boron.

THE GRAPHITIC LUBRICATION OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal.*

Sir,—I am interested in the letters from your readers in reference to the above-named subject. Not only is graphite useful for the cylinders of petrol motors, but for change speed and differential gear boxes there is nothing to equal it. It is unnecessary to wash graphite if you get a good brand such as supplied by the Auto-Lubrine Company.—Yours truly,

Old Subscriber.

To the Editor of *The Motor-Car Journal.*

Sir,—Referring to the correspondence, *i.e.*, W. D. Bowman and G. Gibson, on December 31st and January 7th, respectively, they appear to be very unfortunate in their experience with graphite. In our opinion graphite is what might be termed a perfect lubricant, if perfection in anything is possible; but, of course, it is a *sine qua non* that the graphite be entirely pure and free from grit, such as our pure air floated graphite. Prepared in this way, the graphite is in a very fine state of division, as it is only the lightest and finest particles which are collected, and consequently may be said to be free from grit.

As to the introduction of graphite into the cylinder, this is a point upon which opinions differ, and we may say that personally we find no drawback to a certain amount being blown into the crank chamber, but a decided benefit. In the gear cases and other parts it is a very decided

Digitized by Google

advantage, but must be in moderate quantity, as there would be no sense in loading up a machine with lubricant, and expecting the best results. We are quite at one with your correspondent, Mr. Bowman, as to the use of graphite for cylinders, and also for crank bearings, but as to graphite getting burned into the porcelains, and destroying the plugs, we fail to see how this can happen, as it requires a very much greater heat than we are able to command, being at the same time an entirely inert substance, and unchangeable under heat. We have only touched on the one or two points, raised by your correspondents, as our desire is not to raise any discussion, but if possible, to prove that graphite can be had having all the properties necessary for thorough satisfactory lubrication.—Yours truly,

GLASGOW MOTOR TYRE COMPANY.

CRACKED CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed very frequent letters in your valuable paper asking for information as to repairing cracked water-jackets. It seems to be the invariable conclusion that there is no reliable means of repairing them. The sal-ammoniac method has the drawback that even if a good job is made of it there is always a quantity of rust produced inside the water-jacket. The iron patch method cannot be applied round difficult bends and corners with any fair amount of success. The best means of repairing a crack must be a mechanical one, especially if inside the head. I have come across a very reliable method of repairing cracks to either inside the head or outside. Details of this I shall be pleased to give to any reader requiring them, and giving name and address. As it is a trade secret, I am, unfortunately, not able to give them in these columns.—Yours truly,

ANOTHER SUFFERER.

THE FIAT CAR.

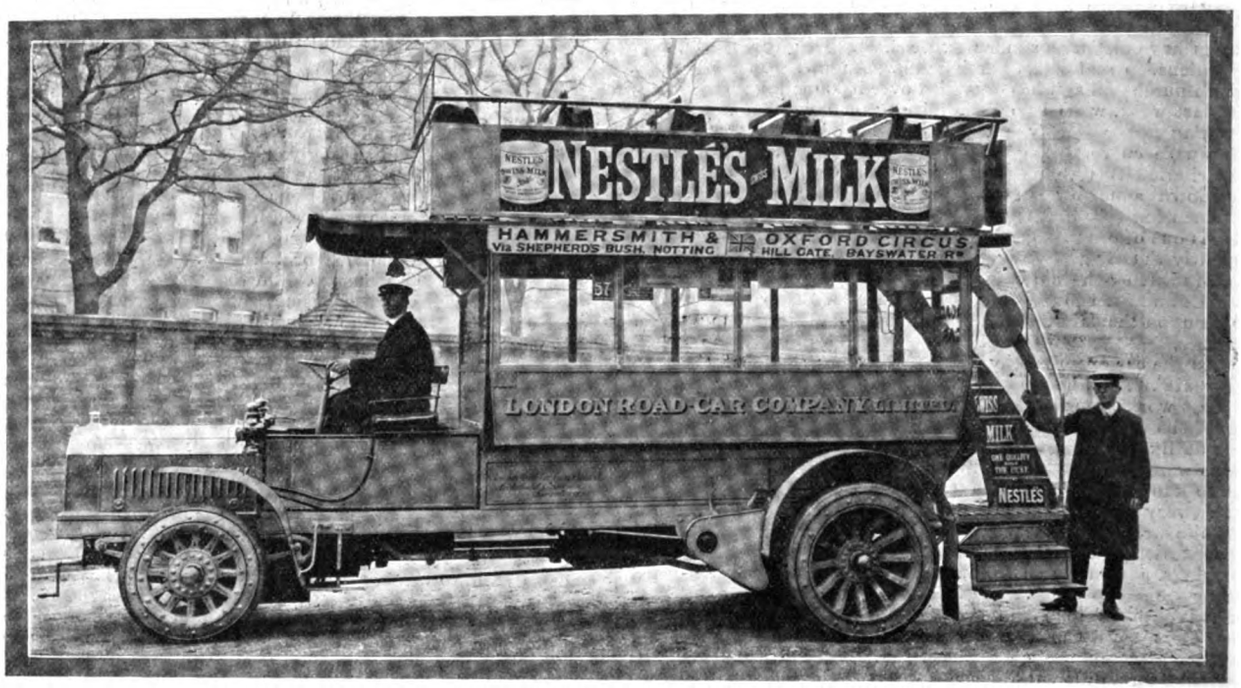
TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any owner of a 24-h.p. Fiat car say if the driving mechanism has been satisfactory? I have run my car about 800 miles and have had somewhat heavy repair bills. This may be bad luck, bad driving, or inferior material. I have now reduced the speed by fitting sixteen-teeth sprockets in place of nineteen, and the car seems to run better.—Yours truly,

C. D. L.

CHANGING IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.



SIR,—In answer to "Free Manse's" letter in the *Journal* of the 24th ult. *re* fitting electric ignition on a Leon-Bollée tandem, I have fitted the above to mine, and find it very satisfactory. I screwed a chain ring (bicycle) on to the engine shaft about 1 in. from the flywheel. To do this I had to remove the whole of the governor collar. I do not now use the governor, as I found it rather a bother. I drive by chain to a sprocket wheel, having, of course, twice as many teeth as the chain ring. The sprocket is mounted on a shaft running in two bearings raised on uprights attached to the back of the rear seat. This arrangement allows the contact breaker to be easily inspected. The above is very cheaply put on, and works very well. I have attached a box to the back of the seat to hold the accumulator and coil. Hoping the above will be of some use.—Yours truly,

EYRETON.

BRAKE AND CLUTCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems to be the universal practice of makers to so connect the brake pedal that when it is depressed it also withdraws the clutch. I do not think this is good practice, and when I get a car so connected I always remove the connecting-piece. The reason for this is, that if you are going down a long hill you can use your engine as the first brake with the first, second, or third speed in gear, according to steepness of the hill, and if these are not sufficient you can then apply the foot brake in addition, without withdrawing the clutch; you then have the side brakes left for severe work. By using the engine (with gas shut off) as a brake, you save the other brakes from wear and getting hot. I think this is worth consideration.

One of the New London Motor-Omnibuses.

An order for fifty-one motor-'buses of the type illustrated above has been placed by the London Road Car Co. with the Motor Car Emporium Co. The motor power is supplied by a four-cylinder 24-h.p. vertical petrol engine. Three speeds forward and a reverse are provided, the final transmission to the rear road wheels being by side chains. A double system of high tension ignition is fitted, the commutator and plugs being in duplicate. An automatic carburettor and a variable lift and timing of the inlet valve opening are special features, by means of which an extremely flexible engine is obtained.

I find that strips of copper riveted to the steel brake band is better than leather or fibre, as it does not burn, and seems to get a good grip, so much so that I use a little oil to take off the fierceness and save the wear. I have a strong prejudice against the internal expanding brake. The out-side band brake divided in two halves, double acting, large diameter drums, with a wide face, is in my judgment much the best for the following reasons. First everything is outside, can be seen, is get-at-able, more easily adjusted, will lock the wheels if necessary, cheaper to make and renew, can be examined without having to pull wheels off the axles, can be protected from mud by use of leather covering pieces being fitted over the drums. Fashion seems to have set in favour of internal brakes, but fashion is not always best in these matters.—Yours truly,

J. COOP.

SPARKING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the enquiry under the above heading in the last issue of the *Journal*, your correspondent does not state whether the wipe is the one supplied with his car nor the type of the latter. Most probably the cause of the trouble is that the return or earth through the half speed shaft is not efficient. I have always added a separate earth wipe to all my commutators with improved efficiency.

Digitized by Google

My present car—a 10-h.p Motobloc—was originally arranged with the earth going through the shaft; after a time the commutator, by reason of its resting on the half-speed shaft, wore badly and the engine started to misfire, so I designed a bracket to encircle the shaft, on which bracket the commutator rocks with a separate earth wipe. This made things perfect, for I have not had a misfire since on this class of wipe. You must not put too much oil—there ought to be only a moisture. The commutator is a Bassé-Michel. I shall be pleased to show my cars and to advise your correspondent what to do with his if he will let me know its make and the type of commutator.—Yours truly,

LEONARD BAYNES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—"County Motorist's" trouble, referred to in the last issue of the *Journal*, may in all probability be due to other causes than the contact breaker; a faulty coil, or even a bad earth, would cause this. Before fitting a new contact breaker, I would advise taking the existing one off, thoroughly cleaning, and again trying it, making sure that the initial contact in the commutator is in good circuit with the cam shaft. If the trouble still continues and a new contact be decided upon, I would recommend a roller contact of the Lacoste type. I have had this form running daily on a car for the past seven months, and can thoroughly recommend same.—Yours truly,

H. J.

PRIMARY CHARGING BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—Would any of your readers give us their experience in the use of the Boron battery? We bought a set of twelve cells and followed out the instructions sent, but up to the present they have been a failure. If we place more than one forty ampere-hour accumulator on them at one time we cannot get over three volts, and unless we fill up with fresh acid we cannot get that; the result is that it costs us about 2s. 4d. per accumulator. We have hitherto charged accumulators from a plating dynamo, but thought the above would be splendid to charge at night. We have managed to charge eight accumulators in nine weeks. We read a letter from one of your correspondents a few weeks ago asking for similar information, but have not seen any replies.—Yours truly,

THE SOUTH-WESTERN MOTOR COMPANY.

SEE TO THE BRAKES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I notice in your issue of the 7th inst. a letter by Mr. J. Thompson recommending the use of Plaxine for the brakes. I have often thought of giving it a trial, but, having a vague idea that it would be detrimental to the leather or ironwork, I have been deterred from using it. May I ask if Mr. Thompson's friends have given Plaxine an extended trial, *i.e.*, long enough to ascertain what effect it has on the ironwork and leather of the brakes? I may mention that I find that my hand brake works satisfactorily, when properly adjusted, merely by the application of castor oil now and again. It is the foot-brake that gives trouble owing to oil splashing on the drum.—Yours truly,

CONQUEROR.

CHAINS FOR TRI-CARS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In connection with the rapid development of the three-wheel motor-vehicle, which has become to be known as a tri-car, the majority of which are chain driven, there is one point which does not seem to have had the thought bestowed on it that it certainly needs, viz., the size of chain fitted. Almost invariably the same size of chain is used for the second drive as for the first. Since the second motion chain runs at a considerably reduced speed as compared with the first, the pull upon it is greater, and consequently a stronger chain should be used. So far this point appears to have been overlooked by most designers of this increasingly popular type of machine.—Yours truly,

W. K STELFOX.

HEADLIGHT TRIALS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In a recent issue you suggested a trial for motor head lights. I have lately had a "Sampson" head light fitted to my car, which I think fulfils all the requirements of such a light, being brilliant, but with such a *concentrated* beam that no inconvenience is caused to other users of the road. I am sure if a trial could be arranged and Messrs. G. Polkey and Company would compete, the trial would be of real value,—Yours truly,

FRED H. MABERLY.

SIX VOLTS FOR IGNITION.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—Regarding the recent letters on the subject of six volts for ignition, I may state that I have used a six-volt current through the coil of my four-cylinder Gladiator for the past eighteen months. My coil, of course, was built for four volts, and what led me first to try six volts was the fact that shortly after getting the car I detected a slight miss-fire when the engine was running at a high speed. This I attributed to either the tremblers being not quite fast enough, or to slight uneven wear taking place in the wipe-pattern contact breaker. At any rate, I changed over to six volts, and I can only say that the use of the higher pressure current has with me been a great success. I never have a miss-fire, presuming, of course, that everything is in its proper order, and the power or "life" of my engine has been increased to quite a remarkable extent. I am a strong advocate of six volts for the primary circuit of *four volt* ignition coils, presuming the coils are properly made and by some good maker, and I feel sure that your correspondent, W. F. Rhodes, could improve his running by adopting the higher voltage, and without the slightest danger of injuring his coil, trembler, or any other parts of his ignition system.—Yours truly,

W. P. BURKE.

A COUPLE OF QUERIES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should not like to be so dogmatic as to give a definite reply to your correspondent "E. D. Fawcett's" query as to the best single-cylinder car, but I fancy my experience with a model B. Cadillac may interest him and possibly other readers of your valuable *Journal*. I purchased this car last August and have run it nearly 4,000 miles since then. It has given me practically no trouble whatever. I have only had one road stop, and that owing to no fault of the car but through too thick oil being put in the lubricator. I have yet to meet the hill it will not climb. I have had it in Wales and other hilly districts. I took the long, and, in parts, extremely steep Birdlip Hill (Gloucester) in fine style, passing a 16-h.p. four-cylinder car, the driver of which had to get out and run by the side of the car, the engines stopping twice on the hill. I have driven three miles in less than six minutes. The car is simplicity itself, and it is almost impossible to damage it by careless driving; it is practically noiseless and has been taken for a steam-car on several occasions. My longest run was one of 105 miles in 5¼ hours (including Birdlip Hill).

I may say that you can drive on top speed from four to thirty-two miles an hour and it will take hills on low speed at about eight. It is running to-day as well as ever. I have no interest in the sale of these cars, but I am so well satisfied by its performance that it is a pleasure to testify in its favour.—Yours truly,

F. C. H.

HEAVY MOTOR-CAR ORDER, 1904.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should be obliged if any reader of the *Journal* will explain part of Article 6, dealing with strips or strokes on the wheels, which says "Provided" if the tyre is constructed of separate plates, these plates or strips may be separated by parallel spaces, etc., the space between each stroke plate I understand is to be ⅛ inch of the width of the tyre; that I interpret for a tyre 8 inches wide you could have one inch spaces, but it does not say what width the strokes may be, or yet what thickness they will be allowed. This latter part I shall be glad of information upon.—Yours truly,

T. C. MOLESWORTH.

TRI-CARS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—Thinking of buying a good tri-car, and having had no experience of that class of vehicle, I should be greatly obliged to any users of these who would favour me through your columns with their experience and with any information that would assist me in avoiding the mistakes to which beginners are liable. I propose, if I buy one, getting a good powered machine with free engine, as I am physically incapable of pedalling.

For runs say up to 100 miles a day are tri-cars generally satisfactory and easy to manage? Are they comfortable for driver and passenger, and how do they compare in this respect and cost of running and upkeep with light two-seated four-wheelers? I have heard that the vibration is excessive and that driving tyres soon wear out. Can any particular make of tyre be recommended for this class of machine? Is the water-cooled engine preferable to the air cooled? Is the licence fee the same as for four-wheelers? Are the best makes of tri-cars now generally fitted with two-speed gear? Advice on these points and information as to cost of running and repairs would be much appreciated by the writer and probably by others somewhat similarly circumstanced.—Yours truly,

BEGINNER.

DIMENSIONS OF INSPECTION PIT.—Replying to W. Lockwood, who enquires as to the dimensions of an inspection pit, we would recommend the following:—Length, 7 ft.; width, 2½ ft.; and depth about 4 ft. It should be furnished with a cover of stout boards fitting into a ledge, so that it can be closed flush with the floor when not required. If the pit is out of doors, or water is otherwise likely to penetrate, a drain should be provided. Steps at one or both ends of the pit will also be found useful not only in giving access thereto, but enabling the user to adjust himself, as it were, to any particular work.

NON-SKID BANDS.—"Norwich" writes:—"I would be glad if some of your many readers who have used the "De Fornier" leather detachable non-skid device could give their experience and opinion of same."

THE FIRST YEAR'S WORKING OF THE MOTOR-CAR ACT.*

By A. Moresby White.

The object of the Motor Car Act, 1903, was to remove existing restrictions upon the use of light locomotives on highways and to facilitate the better identification of any offending motor-car. The right to use a motor-car on the highway is not a common law right, but depends upon a statutory privilege enabling light locomotives to be used on the highway. It is important to notice that the motor-car is a carriage within the meaning of the Highway Act or any other Act of Parliament, and therefore under existing highway law a motor-car being a carriage has as much right to the use of the highway as any other vehicle. Under the Act of 1903 there are still considerable restrictions on the use of motor-cars; some of these are of a highly penal nature. The rule of law is that all penal statutes, such as the Motor Act, 1903, must be strictly construed and always in favour of the person exposed to the penalty. In considering the effect of a year's working of the Act it may be useful to take particular instances from its various sections and show how these have been enforced by the magistrates.

The object of Section 1 is to prevent reckless driving and as a necessary result to protect the public from danger. It contains four separate misdemeanours.

1. Driving *recklessly*.
2. Driving *negligently*.
3. Driving at a *speed* which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the highway, and to the amount of traffic which actually is at the time or which might reasonably be expected to be on the highway.
4. Driving in a *manner* which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the highway, and to the amount of traffic which actually is at the time or which might reasonably be expected to be on the highway.

Each of these four offences is termed an offence under the Act, the penalty being a fine up to £20, and also endorsement of the licence of the driver. The licence *must* be endorsed for any offence under Section 1, and there is no power in the Court to dispense with the necessity of endorsing the licence.

For a second offence under Section 1 the driver may be sent to prison for a period not exceeding three months.

The appeal against any conviction where the fine is over 20s. or where imprisonment is ordered lies to the quarter sessions of the county or borough, as the case may be. The value of this right of appeal is more apparent than real, for the magistrates at quarter sessions as a rule support the views taken by their brother magistrates at petty sessions. When the fine is one of 20s. or under 20s. there is no right of appeal. It sometimes happens that the Court will regard the offence as a trifling one, deserving merely a small fine, *e.g.*, 5s. and costs. This is cruel kindness, because the licence is endorsed and there is no appeal. In such cases, if it is at all likely that an appeal may be desirable, the defendant should at once ask the magistrates to alter the fine to 21s.

The proper course in such trifling cases for the Bench to pursue is to dismiss the information without proceeding to conviction, and if necessary to order the defendant to pay a reasonable sum to cover costs. Express power is given to this effect by the Summary Jurisdiction Acts, but it is rarely used.

The four offences in the first part of Section 1 being different, it follows that a summons which charges the defendant with more than one of them is bad and must be amended. The defendant can force the police to elect on which charge they will proceed at the hearing before the justices. If the conviction is drawn up to include more than one offence it is bad, and will be quashed upon *certiorari*, as was done in Rex *v.* Wells, where the motorist was convicted for driving at a speed *or* in a manner which was dangerous to the public.

An important point in the rules of evidence is that in trying to prove one criminal offence you are not entitled to adduce evidence of another criminal offence; therefore on a charge of driving in a *manner* dangerous to the public, evidence of the motorist going at a dangerous rate of *speed* is, strictly speaking, inadmissible. Again, if the summons is for driving at a *speed* which is dangerous to the public, evidence that the car zigzagged about the road ought not to be admitted.

It is highly important to notice that the real gist of Section 1 is danger to the public. In every charge made there ought to be affirmative evidence of public danger. A car may go at eighteen miles an hour without incurring any punishment, mere speed under twenty miles an hour is no offence; even if twenty miles an hour is exceeded the penalty does not entail endorsement of the licence. It has been contended that the exception in Section 4 of an offence "consisting solely of exceeding any limit of *speed* fixed under this Act" applies to the offence under Section 1 of driving at a *speed* dangerous to the public, and that therefore for this offence the penalty of endorsement of the licence is not incurred. I have argued this point in the High Court, but the answer of the Lord Chief Justice practically enforced the necessity of recognising that danger to the public, not mere speed, was the object of Section 1. The *manner* of driving may be dangerous to the public wholly irrespective of the pace at which the motor-car is moving.

Strict proof of public danger must be insisted upon in every case. Be it carefully observed for any offence under this section an Englishman may be sent to prison without having any right to trial by jury. It is most important, where the cherished birthright of an Englishman is taken away and his liberty placed absolutely at the mercy of any two magistrates sitting in petty sessions, that so penal a law should be strictly interpreted by the Bench. Unfortunately, there are countries where an appeal from petty sessions to quarter sessions upon a question of public danger—indeed, on any point affecting motorists—would be futile.

The words in Section 1, "nature, condition, and use of the highway," are sufficiently clear; "use" refers to the *quality* of the traffic as distinguished from the *quantity* of the traffic.

The phrase "the amount of traffic which might reasonably be expected on the highway" presents a very serious question. Magistrates frequently read this as enabling them to assume that when a motor-car is running at twelve miles an hour on the open road there might be a large crowd of people going to the village feast, or a number of children might be going in or out of school; therefore as persons might be there, they think they are entitled to hold that the public have been endangered by the motor-car. A car going six miles an hour, hypothetically speaking, *might* run into a village party or a band of school children; therefore a conviction *must* follow. But this hypothesis is quite untenable. The best evidence of the traffic which might reasonably be expected to be on the road is found in proving what traffic was actually there at the time in question and at the place in question. Every criminal offence is, broadly speaking, local in place and definite in time; in motor-car offences, the exact time and place are most important considerations which the magistrates frequently ignore. To suggest that at some other time of the day at the place in question there *might* be a quantity of traffic cannot be evidence of public danger. If the traffic had been there when the car passed, then the driving of the car might have been different. The truth is, convictions are arrived at on the assumption that the motorist will pursue the same conduct in any state of facts, whatever they may be.

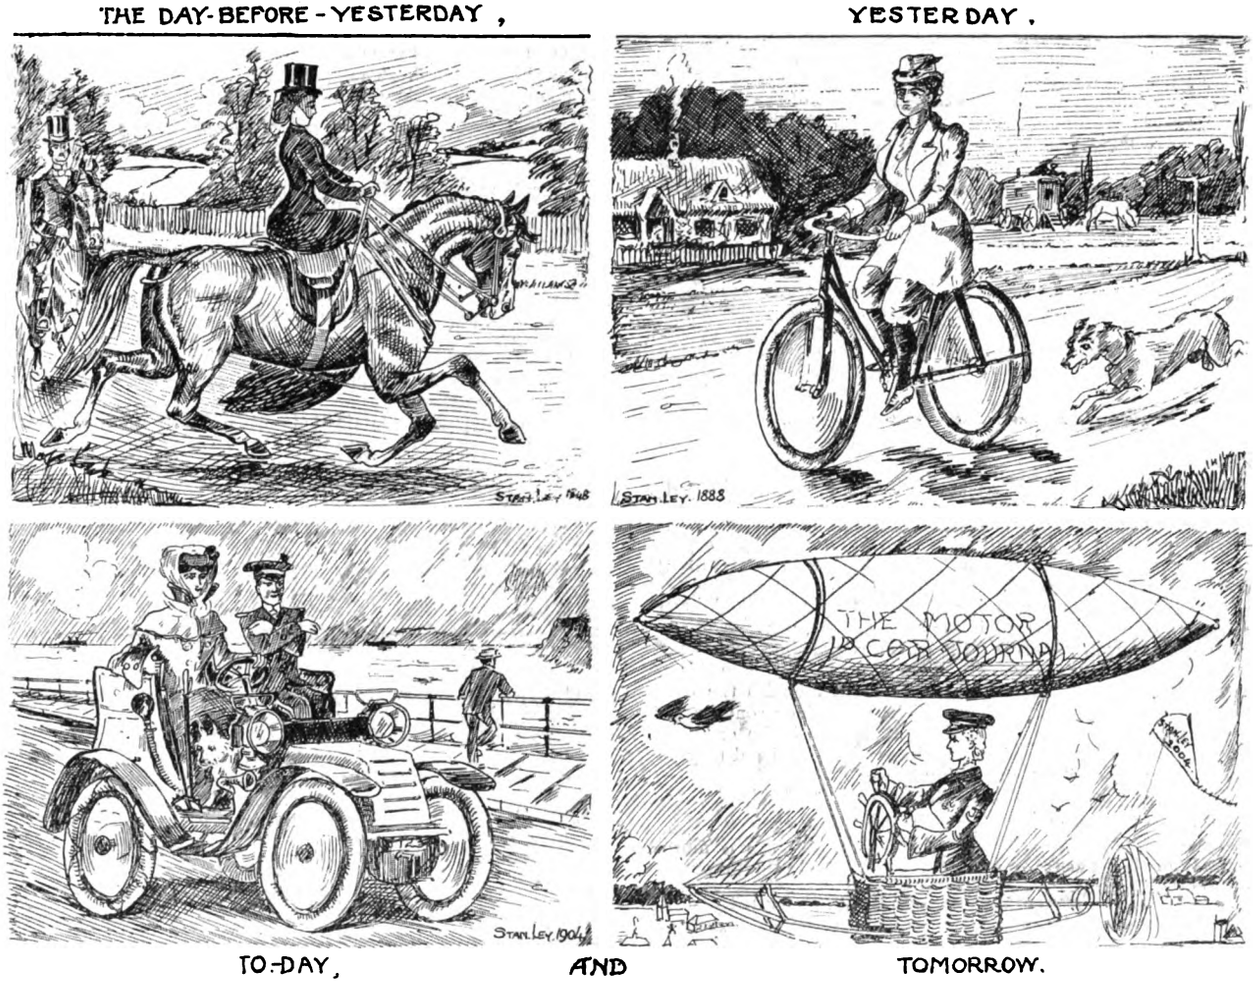
The magistrates have used Section 1 as an instrument to reduce the speed of motor-cars. Speaking generally, they have not made application to the Local Government Board under Section 9 of the Act to limit the speed to ten miles an hour in their area, nor have they applied under Section 8 to enforce restrictions on particular roads, but they have stretched Section 1 in a manner and to a use for which it was never intended. They seldom require any proof of danger to the public; on evidence of speed being given they readily infer danger to the public, and on mere inference they convict the motorist. Thus, by means of Section 1 the speed of motor-cars is reduced to such a limit as in the opinion of the particular Bench is a fit and proper speed, a variable limit entirely dependent upon the fancies of any two county justices. This direct limitation on speed is the result of the way in which the Act is now administered, which I believe to be utterly illegal, and was never intended by the statute.

The police trap question calls for a short notice. As a rule the evidence of a policeman when timing cars is wholly unreliable, not merely as to the correct taking of the time, but as to the surrounding circumstances of the case. Unfortunately the magistrates are somewhat prone to act upon this sort of evidence, however strongly it may be denied by the motorist and rebutted by other facts. When stopped by a policeman the motorist should inquire if there is a watch, and demand to see it, taking a careful note of the position of the hands and of the watch itself. Make a written note as soon as possible of the conversation, and particularly as to the presence of traffic on the highway at the time. The wheel marks of a car left on the road surface are frequently of great value in proving where the car was. The man who, after being stopped, hurries on without taking some precautions, is foolishly throwing away his best chance of defeating the police. To give warning to anyone of a trap is no offence, it is warning a person not to break the law.

I have said that there must be strict proof of danger to the public. Mere opinion is not evidence, and the opinion of a policeman ought not to be admitted as evidence.

The offence of driving in a *manner* dangerous to the public is further elucidated by reference to Article 4 of the Regulations of the Local Government Board, which contains several directions to be observed by all drivers.

In all cases, when summoned into Court, the motorist should ask: "Have there been any complaints by the public of my driving? Do the police produce any witnesses, drivers, cyclists, or other members of the public, who say I have endangered them?"



The offence of furious driving on the highway is dealt with by other statutes. In the Highway Act of 1835 there are ample provisions for restricting the speed of any carriage, which includes any motor-car. Again, in the Towns' Police Clauses Act, 1847, there are further restrictions on driving which are applicable in urban districts. Moreover, under the Metropolitan Police Act, power is given to punish the furious driving of any vehicle within the metropolitan area, which extends, roughly speaking, twenty miles round Charing Cross. But in the zealous working of the new Act these valuable provisions have been utterly ignored; it is always "a case under the new Act!"

The power of a policeman to arrest without warrant is strictly limited to cases of felony, or of breach of the peace, or where authorised by special statute, as, for instance, by Sub-section 2 of Section 1. It may be observed that the power of arrest does not justify an assault, it only

* A Paper read at a meeting of the Automobile Club on the 12th inst.

· THE · YOUNG · LADY ·

avails against the actual driver. If a driver has not got his licence with him, then there can be no *refusal* to produce it, but the driver may be proceeded against under Section 3 for not producing his licence.

There is a new liability imposed by the Act on all owners of motor-cars entirely without precedent in the criminal law. In certain circumstances he is bound to give information which may lead to his own conviction. The plain reading of the Act is that if a car has committed an offence under Sec. 1, then the owner of such car must give any information which it is within his power to give which may lead to the identification and apprehension of the driver. It has been assumed that he is bound to give this information to the police, but the Act does not say so, nor does it say who has a right to ask for such information. An attempt is being made to extend this liability of the owner to the case of a car exceeding the legal limit of twenty miles, and the point will shortly be brought before the Court for decision. The owner's liability is on the face of the section restricted to those cases where the driver has refused to give his name or address, or has given a false name and address, and there is every reason for contending that it is only in such cases, where there has been a deliberate attempt by the guilty person to deceive the police, this serious liability should be thrown upon the owner of the car. On the other hand, it is said if a driver travels at excessive speed for many miles, refusing to stop, there is no method of catching him, it being almost always impossible to identify him. In such a case, it is argued, the car has offended under Sec. 1, and although the driver has not refused his name or address, yet the owner must give information to the police, otherwise the more guilty the man the more chance he would have to escape. But the truth is this case is not provided for by the Act; to cover such flagrant cases the section has been extended by the Courts in a most unwarrantable manner.

No test of skill in driving is required by the Act. Before a licence is issued to a driver there seems to be no reason why some examination should not be imposed upon the applicant.

The endorsement of the licence is the principal penalty provided by the statute, and it *must* follow on any conviction in connection with the driving of a motor-car. It is not limited to convictions under the 1903 Act; it is wholly immaterial under what Act or regulation the driver is convicted, his licence must be endorsed. To this sweeping rule there is an exception—the first offence and the second offence of exceeding the speed limit of twenty miles per hour. Any "offence under the Act" entails endorsement of the licence, and it is open to argument that the mere non-production of his licence by the driver owing to his inadvertently having left it behind him must entail the serious penalty of endorsement of the licence.

For the purpose of endorsement the licence must be produced within a reasonable time, but the motorist is not bound to produce it in court immediately on his conviction. Indeed, he is not bound to have it with him in court. The only time the licence *must* be produced is when the holder is actually driving a motor-car. It is a common practice in motor-car cases for the police to get the licence from the accused directly his case is called, and hand it up to the Bench for their inspection; should there be any existing endorsement upon it, the chances of that motorist escaping conviction are very small. This practice is quite illegal, and every motorist should resist any application of this sort made to him. He is under no obligation to produce his licence until a reasonable time after his conviction, which would probably be seven days, the period allowed for giving notice of appeal.

The regulations as to marks, particularly manufacturers' marks, stand in need of revision. The general identification mark ought to be extended in its use; the present restrictions upon it are so narrowly construed by the magistrates that the dealer finds himself severely hampered in his business. Indeed, unless he is very careful he is exposed to a charge of fraudulently using identification marks under Section 5 of the Act, a charge only to be brought on the strongest evidence of dishonesty or forgery. Nevertheless, the Inland Revenue authorities have recklessly brought such charges against dealers, putting them to great inconvenience and expense in defending themselves. The meaning of "trial after completion" is in each case a question of fact, whether completion has happened; there may be several such trials. "Trial by an intending purchaser" does not justify the hiring or loan of a car with a general identification mark.

The Local Government Board have power to restrict in any way or prohibit entirely the driving of cars on any road where motor traffic would be especially dangerous. This has only been exercised in England, at Beverley, while no instance exists in England of an area with a ten-mile limit, although numerous applications have been made to put this limit in force. It is a pity some of these anxious local authorities have not utilised their own powers under the Act to erect sign-posts at dangerous

Digitized by Google

places on the highway, which would be of real value to *all* travellers. This valuable power is wholly neglected.

Exceeding the legal limit of 20 miles per hour is an offence not so frequently charged as an offence under Sec. 1. There must be in evidence something more than the opinion of one witness, not merely a watch held by him, but independent coroborative testimony. The driver must be warned of the intended prosecution at the time, or notice of the intended prosecution must be sent to him or the owner of the car; in either case it gives him a chance of getting witnesses on his behalf. If a policeman says, "I shall report you," it is hardly telling a man that a prosecution is intended; in such a case, if a written notice has not been given, it seems that the driver cannot be convicted under Sec. 9.

All motor-car offences may be dealt with by the summary jurisdiction of the magistrates, and from their decision there is no appeal on the facts unless a fine of over 20s. is inflicted. Then the appeal is to quarter sessions, where the prejudice against motorists is frequently a serious matter. If an appeal is intended, the proper notice must be given within seven days of the conviction. This is a most important point; the person aggrieved must make his decision quickly, and serve his notice within seven days. Other remedies only apply to matters of law. Where a conviction is bad on the face of it, and in some other instances, it may be quashed by a writ of *certiorari* from the High Court, a procedure which has already been used successfully. It is a valuable protection to motorists, though little known at present.

The magistrates may state a case, on a point of law, for the opinion of the High Court, but this remedy is of little use, as it is very easy for the magistrates to so word the case that the appellant has no chance of success. A fourth course open is to apply to the High Court for a writ of mandamus, ordering the magistrates to hear and determine according to law, which is of no practical value.

The Heavy Motor-Car Order was issued after this paper had been written, but a word on one aspect of it may be useful. Extraordinary traffic is not prohibited by any statute; the person responsible for it must pay for any damage thereby occasioned. Excessive weight is one thing, and may damage a road; traffic is another thing, and includes the continuous or repeated use of a road by various vehicles belonging to one owner, quite apart from the load carried. The thing to regard is the ordinary traffic of the particular road in question. Claims under this head may be brought in the County Court if not exceeding £250.

Has the public mind been satisfied by the 1903 Act? Probably not. The nuisances of dust, of noise, of smell, all survive. For each of these the motorist is liable at common law if it is clearly brought home to him individually. The main objection in the public mind to the motorist is speed, not the fallacious test of speed in miles per hour, but improper speed at any special place. The highway is still regarded as the legitimate playground of children, dogs and fowls. Any speed which threatens this ancient vested interest is obviously to the public mind dangerous. Therefore it is that Sec. 1 of the Act has been relentlessly enforced, backed up by more false swearing than any other Act ever evoked, until the experienced motorist has painfully realised that his statements are scarcely ever believed in a court of summary jurisdiction.

The main object of the Act has been achieved; cars can be easily identified, and, in most cases, the drivers also, this without serious friction. So far as the public safety is secured, but the apprehension of danger remains. Deep rooted in the public mind is this fear of the speedy vehicle on the public road. Until by gradual education this is removed the motorist must expect to suffer the usual fate of a minority.

CLUBS AND ASSOCIATIONS.

THE SOUTHERN CLUB.

The headquarters of the Southern Motor Club are being removed to the Canterbury Hotel, Brixton.

A club evening will be held as usual every Thursday and a smoking concert and lantern lecture will be held on Thursday next, the opening night of the new rooms. Members, friends, and non-members are equally cordially invited to attend.

CLAIMS AGAINST MOTORISTS.

At the Ripon County Court, Ambrose Morrell, of Burton Leonard, near Ripon, farmer, sued H. Johnson and Co., Ltd., Montpellier Parade, Harrogate, for £35 damages caused to plaintiff's mare and cart by reason of the negligent driving of a motor-car by a servant of the company on December 2nd, 1904. The jury were unable to agree on the question of negligence, and were discharged.

At Dublin, the case of M'Niel v. Glendinning has been concluded in Nisi Prius Court. It was an action to recover damages laid at £500 by the plaintiffs, Henry M'Neill, Limited, who own a posting establishment, and carry on a tourist trade at Larne, Co. Antrim, from the defendant, Robert G. Glendinning, of Belfast, for damage to a motor-car caused by the alleged negligence of defendant in driving his own motor-car on August 19th. It appeared from the evidence that the plaintiffs' tourist motor-car was proceeding with passengers along the sea road between Carnlough and Larne, and when about a quarter of a mile from Carnlough a motor-car driven by the defendant came up behind and a collision occurred, the car of the plaintiffs being forced up against the side of the road and wrecked, while the passengers were flung out and more or less injured. The jury found that the defendant had been guilty of negligence, and they awarded the plaintiffs £100 damages.

CASE DISMISSED.

At the Guildford Borough Police Court, Mr. John Dennis, Guildford, appeared in answer to an adjourned summons for having driven a motor-car in High Street, Guildford, without exhibiting an identification mark thereon, on December 11th.—P.C. Biles said on Sunday, December 11th, about 12.30 p.m., he saw the car go in the direction of London Road without any identification mark. At 1.40 p.m. the car returned, and witness stopped defendant and asked him where the number of his car was. He said it was not on the car and that he had lost it on the road. Witness then said he had no number when he left the town, and defendant replied that he had only just had the car delivered to him, and that no number was required.

Defendant cross-examined the constable at some length, and elicited the fact that he had been in the police force two months and was ignorant of the provisions of the Motor Car Act of 1903. Witness said he did not think that from appearance and finish the car had just come out of the works. Witness made no reply when Mr. Dennis suggested that it was rather curious that he as a motor-car manufacturer should have a car delivered to him, and admitted that the statement about the identification mark having fallen on the road was made immediately after his (the constable's) question. Gordon Wise, chauffeur to Mr. Naumann, of Redhurst, near Cranleigh, said on December 9th he called on defendant with instructions from his employer to hurry on with the delivery of the car. It was overdue on that date. Arrangements were then made that the car should be delivered either Saturday night or Sunday. Defendant said the car was a new one, and at the time in question was the property of the purchaser, it having been paid for a few days previously. He pointed out that under the Motor Act proper time had to be allowed for the owner of a car to get it registered, and he submitted that in this case he had not had reasonable time.—The case was dismissed, but the Mayor said the constable had done quite rightly in bringing the case forward. The members of the force could not be expected to know all the provisions of the Act.

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Haywards Heath....	Several cases of driving beyond legal limit	Fines between £5 and £10.
Dumfries	Failing to stop at the request of the driver of a horse-drawn vehicle	£5.
Bournemouth	Driving dangerously	£7 10s.
S.W. London	Driving to common danger	Dismissed.
Lewes	No rear light	£1.
Lambeth	Failing to produce licence	10s., etc.
Buckingham.....	Furious driving	£5, etc.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JANUARY 28, 1905. [No. 308.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE police on the Brighton road have commenced the year in characteristic fashion, and a trap for motorists at Slaugham has produced a nice little crop of motorists for taxation by the Bench at Haywards Heath. Over a measured furlong an electrical timing apparatus was employed, the policeman in charge discreetly superintending operations from "over the hedge"—to quote his own account of his location. During the course of the discussion at the A.C.G.B.I. recently it was mentioned that many other traps arranged by local superintendents have been made on the suggestion of one or two local residents, and that their existence is unknown to the Chief Constables of the counties. Letters written to the latter officials have brought disapproval and warning to the minor authorities, and such a practice was recommended wherever traps become an intolerable nuisance. The idea is worth bearing in mind, especially by provincial clubs whose members fall victims to such methods.

◆ ◆ ◆

King's Car in a Collision.

IT has only just transpired (says a correspondent) that, as the King's two motor-cars were returning to Sandringham from Chatsworth, after the Royal visit to the Duke and Duchess of Devonshire, an accident occurred to one of them while it was running between the villages of Glaston and Morcott, in Rutland. It appears that a horse attached to a trap belonging to the Hon. P. C. Evans Freke, J.P., crossed the road immediately in front of one of the cars, and, the chauffeur being quite unable to pull up, a collision occurred. The trap was damaged—one wheel being smashed—and the coachman was thrown out, but, happily, escaped serious injury. The King's car received no damage, and after some delay the automobiles proceeded on their journey.

◆ ◆ ◆

Ten Mile Limit Wanted at Guildford.

AT a recent meeting of the Town Council of Guildford a resolution was adopted calling upon the Highways Committee to report as to the desirability of application being made to the Local Government Board to fix a reduced speed limit on automobiles passing through the borough. The Highways Committee considered the matter, and, having looked at it in all its bearings, decided that they could not recommend an application for such an order. Instead they urged the Watch Committee to give greater attention to the speed of all vehicles passing through the town, with a view to preventing danger to the public. When the Council discussed the view of the Highways Committee, several members of that body became picturesque in their language, and the ex-mayor, in supporting an amendment to the proposal, declared that by asking for the restriction the Council would be doing its duty, "and responsibility—and I may almost say blood-guiltiness—would not rest upon us." Eventually, by twelve votes to ten, it was agreed that the Town Clerk should take the necessary steps to obtain from the Local Government Board an order restricting the speed of motor-cars in the borough to a maximum speed of ten miles an hour.

◆ ◆ ◆

Notes on the Paris Salon.

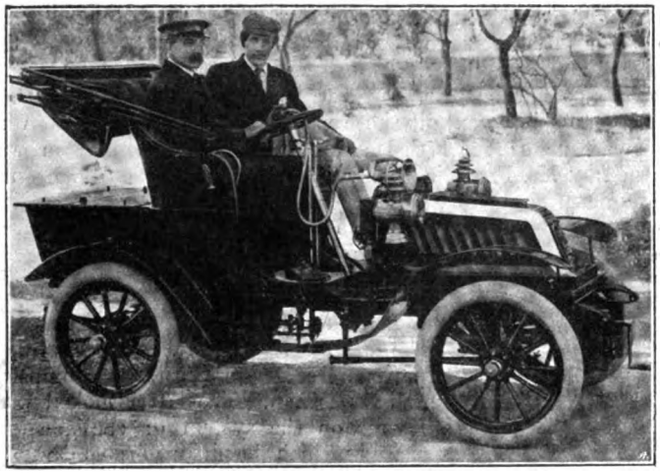
THERE was but a poor attendance of members at the Automobile Club on Thursday last week to hear Mr. E. H. Cozens-Hardy deliverl his paper on "Notes on the Paris Saon," an abstract of which is given elsewhere in the present issue. The lack of interest was probably due to the fact that the features of the recent show in the French capital have so thoroughly been dealt with in the *Journal* and its contemporaries; so leaving the author but little scope to bring out points of the *Salon* that have not already been dealt with. Mr. Cozens-Hardy's conclusions are, however, interesting in so far that they confirm to a large extent those we ourselves gave expression to in our issue of the 17th December last. The discussion was opened by Mr. Frederic Coleman, who remarked that the French manufacturers were apparently not devoting so much attention to the question of simplicity in design as were British makers, and also that builders in France who had hitherto been looked upon as originators in design were now picking up ideas abroad.

◆ ◆ ◆

Magnetic Clutches and Fixed Ignition.

AMONG the others who took part in the discussion of Mr. Cozens-Hardy's paper were Messrs. Crawley, Thompson, and O'Gorman. The latter looked with favour on the system of change-speed gears in which the pinions are continually in mesh, the requisite pair being made to drive by means of magnetic clutches. Colonel Holden, who was in the chair, and who has had considerable experience of magnetic clutches, pointed out, however, that while these were very efficient when run dry, there was a considerable loss of power when such clutches had to work in oil. Another interesting point raised by the paper was whether it is an advantage to be able to advance or retard the sparking ignition, certain makers in France having abandoned all means of varying the point of ignition. The general feeling was in favour of retaining the facility, but it is evident that the last word has not been said on the question.

◆ ◆ ◆



A Run on an Orleans Car.

ON Saturday last we had an enjoyable run on one of the 1905 models of the 15-h.p. Orleans cars, for which Messrs. C. S. Rolls and Co. are now sole London agents. Mr. Claude Johnson was at the wheel, and, starting from the new offices of the *Journal*, we wended our way amidst the busy traffic of Pall Mall and through the parks to Hammersmith, Barnes Common, and Richmond Park, in order to put the car through its paces up the rough stretch which has become known as the "Test Hill." This has a length of 354 yards, and, although it

Digitized by Google

includes a gradient of 1 in 7·8, the car made the ascent in 36½ seconds, which works out at a speed of 19·6 miles per hour. With so satisfactory a result on the hill we were anxious to taste the speed qualities of the car, so the run was continued along the Portsmouth road as far as Wisley, our desires being fully realised as we speeded along the Fair-mile. The homeward trip was equally successful, the run throughout being of a non-stop character. Of the car itself it may be said that it is provided with a four-cylinder engine, with the usual high tension ignition and an automatic carburettor, which renders it exceedingly flexible. The rated power —15-h.p.—is developed at an engine speed of 1,000 revolutions per minute. The transmission is through a leather-faced clutch of special design, a gear-box giving three speeds forward and a reverse on one lever, a cardan shaft and bevel gear to an enclosed live axle, which drives the rear road wheels through its ends, the weight of the car being carried by the fixed casing. On the high speed the drive is direct, and as the bulk of the running is done on "top notch," the car speeds along very quietly; indeed, it was difficult at times to hear the engine, the only audible noise being the ticking of the trembler. The car has a long wheel base, enabling a roomy side-entrance body to be fitted. It is some time since we had a run on one of the Orleans cars, but the result of Saturday's experience is such that we may safely say the 1905 model will fully maintain the reputation earned by its forerunners, both as regards speed, hill-climbing capability, and reliability.

◆ ◆ ◆

The Delhi-Bombay Trials. Mr. F. B. Stewart's 8-h.p. De Dion.

◆ ◆ ◆

The Indian Trials.

Already we have published the awards in connection with the Delhi-Bombay trials. This week we are able to give some views in connection with the event, which will have considerable interest to motorists generally. Supplementary to what has previously appeared, it would appear that K. S. Ranjitsinhji, the cricketer, was extremely unfortunate, his record for a non-stop performance being vitiated by the loss of 1½ marks on the first day. But for this his Lanchester would have secured a good place. The gymkhana at Gwalior was a great success. Lieutenant Skelton won the prize on a Wolseley in the trial of skill for driving, and Mr. Grant, on an Argyll, won the Gretna Green race. One of the most interesting incidents of the trial was the descent of the Thull Ghat on the last day. The Kalyan Creek had then to be crossed by ferry, a process which took nearly an hour. From thence to Bombay the run was uneventful, and all the cars left in the competition arrived there in good style.

An Incident of the Streets

In a case heard at the Marylebone County Court the judge has been descanting on the advantages and disadvantages of stopping a motor-car practically "dead." Often, he declared, such a capacity was an advantage, but frequently it might become a source of danger. In the particular case which called forth such remarks there were three vehicles travelling in the order named, 'bus, motor-car and cab. The first stopped slowly; the second halted quickly to avoid running into the 'bus; the third could not stop quickly and smashed into the rear of the second. Danger to the first was averted by the excellent behaviour of the second; the third, having no such advantage, did damage where a mechanical vehicle might have proved guiltless. Had all three vehicles been equally as governable as the automobile there would have been no case to take to the courts. In addition to that, the safety of our streets would become a matter of fact and not a thing of chance.

◆ ◆ ◆

The International Contests.

British motorists are not inclined to look any more favourably than they did a month ago upon the programme of the international races in France this year. With an unanimity rarely observed in automobile circles the feeling is growing that the protest of the A.C.G.B.I. was right in spirit and dignified in tone. The arguments of the French Club hardly apply to the situation as it now presents itself. When the Gordon Bennett race was previously run in conjunction with another the course was over a straightaway route, not on a circuitous one as now proposed. This is a point of which probably something will be heard when the reply of the French Club is officially considered in this country. Meanwhile some idea of the intensity of feeling that has been evoked by the proposals may be gauged from the motion of which notice has been given by Mr. C. Johnson, to the effect that the number of foreign cars allowed in British competitions should, in future, be determined proportionately to the actual British entries. Whether our Continental friends had reckoned on such a counter move is not within our knowledge, but it should help them to a conclusion that the best way to settle the present rift in international amity is to leave things as they were in 1903 and 1904.

◆ ◆ ◆

Motoring and Skating.

Surely an ideal combination of luxury and exercise, of which full advantage has been taken by motorists during the continuance of the recent hard frost. The roads have been like iron, free of ruts and dust, and travelling through the keen air has been most exhilarating. All the ponds within thirty or forty miles round London have been well patronised, and car owners have had the advantage over other skaters of enjoying lonely and "out-of-the-way" sheets of water nearly by themselves. At the Hut, at Wisley, the crush of cars has been very great, and Sergeant Jarrott, with the aid of a police-constable, has had plenty to do in keeping the road open for traffic. Never, indeed, has this favourite spot been so busy, and the wonderful popularity of motoring was further evidenced last week-end by the continuous passing of vehicles in numbers of four and five. On the Fair Mile there must have been between sixty and seventy cars at the time on the road, making the scene bright and enjoyable.

◆ ◆ ◆

Presentation at Blackpool.

Last week some of the leading public men of Blackpool met to make a presentation to Mr. G. Hubert Woods, of Blackburn, who officiated as hon. secretary for the motor-car speed trials at the Lancashire resort in October last. Alderman J. Brodie, the mayor, presided, and Alderman T. Bickerstaffe, the chairman of the Trials Committee, gave a brief history of the

Digitized by Google

event. Last season there were some motor speed trials at Portmarnock, and there was sufficient racing element in them to make the competitors feel that they had not got the highest results out of their cars they thought them capable of yielding. One of the leading spirits was Mr. Huntley Walker. He was in the habit of staying in Blackpool, where he had a furnished house during the season, and he noted the exceptional facilities offered by Blackpool for racing. Mr. Walker had some conversation with some other gentlemen, and they became anxious that speed trials should be arranged in the town. Mr. Walker, Mr. Stephenson, and Mr. Woods then went to Alderman Bickerstaffe with a promise to undertake the work if the Corporation would give its patronage. Largely owing to the organisation developed by Mr. Woods the event was a great success, and last week a gold chronograph was publicly presented to that gentleman as a slight recognition of the valuable services he had rendered the town.

◆ ◆ ◆

Trial of Head Lights.

THE suggestion has been freely made that the time is opportune for a trial of head lights, and already Messrs. George Polkey, Limited, of Birmingham, have publicly announced their desire to participate in such an event, while other makers are only awaiting particulars from an official source to put their specialities to a practical test. The difficulty of organisation will primarily be concerned with the points for the judges to consider. These should not be narrowed down too much, but should be wide enough to be conclusive to motorists that makers entering lamps in such a trial were well confident as to their merits. The power and steadiness are essential considerations; economy in use, the effect upon other users of the road, the direction of the light, are others that, apart from the quality of the workmanship, will need close examination. Of the utility of such a trial there can be no question.

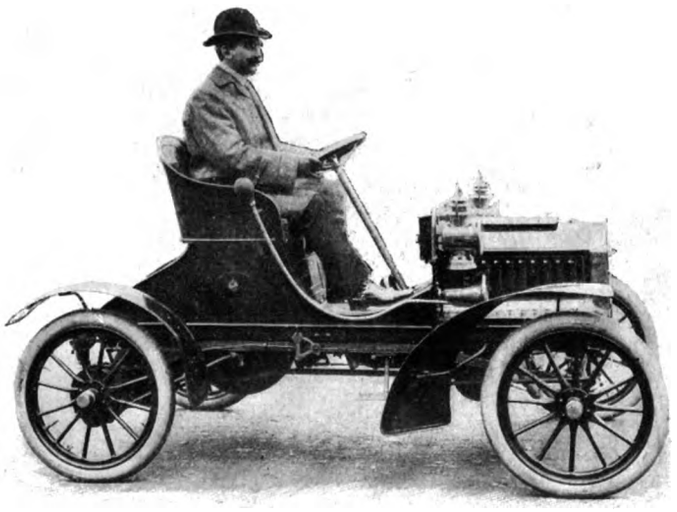
The Sussex Club.

THE formation of an automobile club for Sussex comes at an opportune time, in view of the promised automobile meeting at Brighton during the coming summer. Already Mr. G. H. Warne, of Worthing, and other local motorists are urging the Corporation of "London by the Sea" to prepare their roads with a view to the comfort of the public as well as the convenience of motorists during the race week. Some idea of the number of motorists in the county of Sussex may be gleaned from some recently-published figures, showing that last year 317 cars and 287 motor-cycles were registered in East Sussex, and 175 cars and 234 motor-cycles in West Sussex, the number of drivers licensed in each division of the county being 953 and 561 respectively. At Brighton 120 motor-cars and 179 motor-cycles were registered, and 332 drivers licensed; 54 cars and 64 motor-cycles were registered at Hastings, and 125 drivers licensed, making a total of 666 cars, 764 motor-cycles, and 1,961 drivers for the whole of the county of Sussex.

◆ ◆ ◆

A Society for Drivers.



SOME of the most experienced mechanic-drivers in the Metropolis have formed a Society of Automobile Mechanic-Drivers, and the provisional rules for a friendly society have been discussed and considered. The idea is to limit membership to drivers who have had at least six months' experience on the road, and who have had two or three years' acquaintance in the workshop. Thus, it is hoped, to prove of value to qualified drivers, and while the committee will not interfere with any questions of wages or conditions of employment, it hopes to be able to establish satisfactory sick and unemployed benefit funds. The second general meeting of members will be held at the offices of the Society, 51, Brick Street, Piccadilly, W., at 8 p.m. on Thursday next, the 2nd prox. Forms of application for membership can be obtained from the secretary, who will be pleased to send particulars of the society to all drivers interested—whether resident in London or the provinces.

The 5,000 Miles' Motor Test.

On Saturday last, in the Automobile Club's 5,000 miles' reliability trial, the 12-h.p. Siddeley car by a run to Southampton and back completed the third week of its test. So far the trial has been remarkable for the small number of involuntary stops recorded by the official observer, Mr. Leonard Spong. Beyond one stoppage of the engine owing to a short supply of petrol there have been no troubles, and the last 2,329 miles have been covered without any involuntary stoppages. During the week now closing the Southern coast routes to Margate, Southsea, Worthing, Folkestone, Brighton *via* Lewes, and Southampton will again be utilised. As mentioned last week, the car is fitted with 815 by 105 mm. "Continental" motor tyres, square tread pattern. These tyres have proved their value over some very rough roads.

◆ ◆ ◆

A Vicar's Sport.

Fashions change even in sport, and the motoring parson is becoming a successor to the rector who followed the hounds in the middle of the last century. But the clergy who motor have something added to the idea of mere sport; they can indulge in the pastime and, at the same time, economise time when making their ordinary calls. Thus the automobile has given them a new delight, and also increased their opportunities for usefulness. The Rev. J. Buchanan, M.A., vicar of S. Thomas' with S. Luke's, Leeds, is an enthusiast for the motor-car of small degree, and the article from his pen, which appears on another page, should do something to bring other clergy in the county of broad acres into the automobile movement.

◆ ◆ ◆

The Motor Van and Wagon Users' Association.

At Monday's meeting of the Motor Van and Wagon Users' Association, it was resolved to hold the annual meeting of the Association during the week of the Motor-Car Exhibition at the Agricultural Hall, London. Considerable discussion took place with regard to the annual Parade of heavy motor vehicles, and ultimately the view was expressed that it was not desirable to have a Parade this year, as previous events had really fulfilled the idea of the promoters, and, so great has been the advance, future displays of the kind might become inconvenient, both to users and to the public. Another point of immediate concern to the industry was the question of drivers for public-service vehicles, and it was resolved to communicate with the makers of motor'-buses on the subject, with a view to some practical scheme being evolved.

Motor-cars for Excursions.

Some excitement was caused in the West End the other day as a cavalcade of automobiles of every description, and nearly every date, went gaily through London on their way to Dartford. The fourteen vehicles were bedizened with the flags of almost all nations, though the Stars and Stripes had the greatest prominence. By the side of each driver was a small banner bearing the mystic letters N.C.R., which proved as puzzling to the average pedestrian as was the famous inscription to the immortal Pickwick. As the cars passed our office a 'bus driver solved the riddle with the information that they were concerned with the National Cash Register, and were off to inspect the opportunities for recreation provided for their employees by Messrs. Burroughs, Wellcome and Co., at Dartford. Doubtless as the season for workmen's trips and excursions comes along such motor-car processions will become familiar in our streets—a fact which agents and dealers who let cars out on hire should quickly recognise.

◆ ◆ ◆

The Brighton Trials.

The Mayor of Brighton, Alderman Blaker, speaking at the annual dinner of a local Commercial Travellers' Association at Brighton on Saturday night, made the first public and official announcement that Brighton will have a speed trial this year. The date provisionally fixed is July 18-21, while the motor-launch races will take place on July 22. The Mayor remarked that some members of the Automobile Club had pronounced the Brighton course on the sea front to be one of the finest in Europe. The Corporation were ready to do anything that the club might deem necessary for the event, while the correspondence showed that France, Germany, and Belgium would be represented at the trials. Now that the date has been suggested it is to be hoped that the promotors of other trials will avoid their events clashing with the Brighton meeting.

The paper which Dr. W. R. Ormandy was to have read at the Western Section of the Scottish Automobile Club last week on the subject of fuels for motor-cars, with special reference to those of home production, has been postponed till Monday next.

One of the Lanchester Engine Company's novelties for the year is a four-cylindered water-cooled car, designed on novel lines, the engine being raised and placed between the two front riders; the cooler is in the form of a cross, and is situated in the front of the car.

A Reuter's telegram from Daytona, Florida, states that Mr. Frank Croker, while riding his powerful racing-car on the beach, came into collision with a motor-bicycle. The car was overturned and the driver killed. Mr. Croker who had a leg, arm, and three ribs fractured, and various cuts and contsions, died early next morning from his injuries. The motor-cyclist was also seriously injured.

Recently we referred to the increase in the number of motor garages at Brighton. One has been opened by the Brighton and South Coast Garages, Limited, at St. James' Street, Brighton. Tbis company is in connection with the Fiat Motors, Limited, of Long Acre, W.C., and the Royal York Hotel, Brighton, and the garage has standing room for more than a hundred cars, with a score of private lock-ups as well as repair shops, &c.

In the biting cold winds that have lately been experienced lady motorists have felt the need for a preparation to protect their skin from the effects of exposure to varying and trying climatic conditions. Messrs. Dunhill's are now placing upon the market a toilet requisite known as Motorose, which fulfils the conditions essential in such an application. Its use should prevent chaps and roughness of the skin, and prove agreeable to all lady motorists.

The Sport of Motor-Cycling.

By the Rev. J. Buchanan, M.A.

IT was a proud moment of my life when the editor of the *Journal* invited me to give my experiences and opinions on motoring. Being quite a beginner, my ideas are very elementary, but they may be of some slight use to other elderly men who are thinking of taking up the tri-car. After many thousands of miles on a push-bicycle, an accident to my knee caused me to look out for some less dangerous method of locomotion. I got my 3½-h.p. Phœnix Trimo (chain-driven, two speeds and free engine) last June. The boy Alberto, from Greenwood's excellent motor depot in Leeds, drove me out of the town, and then took his seat in the fore-car. I had never steered a tricycle, and he had a large scar on his face owing to a combination of telegraph post and a former customer; but, remembering that he would be the first to suffer, I took my seat and paddled away on the first speed. In a day or two confidence came and I could change speeds and free the engine in traffic with comfort.

Feeling then fully qualified, I invited my friends to occupy the fore-car and taste the joys of motoring. Unfortunately it was their busy time; slackness in trade had suddenly vanished; professional men, too, who, as I knew, played billiards all day, pleaded press of work. Alone, therefore, on the Trimo I went, tyres board hard and vibration terrific. The roads round my district are like the episcopal egg, good in parts; but, once out of the town, fast round corners, up hill and down dale went the powerful motor. I occasionally broke things, I admit, and lost expensive bolts, but I could always switch off and the brakes were excellent, so no accidents happened. Experience, however, taught me to keep the tyres slack and to be content with a moderate speed on rough roads. Any hill could be climbed with a heavy passenger without overheating.

The Rev. and Mrs. J. Buchanan on their Tri-car.

Being entirely ignorant of mechanics, I bought a manual, and puzzled out the necessary adjustments on the road when things went wrong. I think I only twice had to send for help; once when I could not get the petrol out of the back tank, and, on the advice of a villager interested in that commodity, tried paraffin; and a second time because the needle valve of the carburettor needed adjusting. But I plead not guilty of sending for help because I had forgotten to turn on the petrol or because the points of the sparking plug were touching. Such insinuations arise from envy and are without foundation! Long before this, however, I had learned moderation; passengers became plentiful, and my general officer commanding (*vide* photograph) was persuaded to join. Pleasant runs and short tours followed, and old tandem days returned. In theory I still plump for a quad. with water-cooling, but in practice the Trimo is a success, and after 3,000 miles in all kinds of weather I can appreciate being without the complications of my ideal. Pedals were soon discarded, and Greenwood (who drives a Trimo himself and is most obliging) fitted me up with spring foot-rests and wider mud-guards.

A pessimist in a contemporary lately drew up a very heavy indictment of the three-wheeler. The experience of tri-carists here does not agree with his conclusions, and Leeds is an engineering centre of some note. We find (1) that the driving wheel spindle does not break; (2) "coffee-grinding" extraordinary is not required; (3) fan-cooling is sufficient; (4) vibration is not felt if the tyres are fairly slack and spring seat-pillar and foot-rests are fitted; (5) it is, of course, advisable to slow down round corners; (6) skidding: tram-lines are plentiful here, but fourteen stone on the back wheel corrects any frivolity in front; (7) one gallon of petrol takes two people from forty to seventy miles according to circumstances; (8) two-inch Palmers have never required blowing up, and are unscratched; (9) repairs are not a big item; (10) chain drive is satisfactory, and the Phœnix gear reliable. Evidently the aforesaid writer had either got an inferior mount or is not experienced as a driver of a tri-car. At any rate the three-wheeler is very popular here and many are on the roads daily.

In conclusion, may I say that man wants but little here below, but that he cannot enjoy it by himself? More especially he likes his wife (who, alas! in most cases knows him rather too well!) to see him in a new rôle. When she observes his skilful (?) driving, his ability to put things right on an apparently (but not really) complicated motor, she revises her opinion of him. He becomes once more the brilliant man of ante-nuptial days; his faults are forgotten as the oxygen fills her lungs and her cycling friends are left behind with a distant wave of the hand. Edwin and Angelina once more, they can start out on a little tour any day with plenty of luggage and stay where they like. The passenger is comfortable and cannot get wet or dirty; the proud driver keeps himself warm with excitement and joy if the engine is running well. The rush through the fresh air, the tea at pretty wayside taverns, the idling about in pleasant places, the whizz past the light car on the hills, make motor-cycling with a congenial passenger the finest pastime in the world. Alpine climbing has its moments of pure joy when you have "made" the modest peak of your ambition. Cricket, shooting, cycling and all the other sports of our youth will never be forgotten, but for the townsman of forty with a moderate income the Trimo holds the field, and it will be a long time before the light car at double the price can beat it.

C

A TRI-WEEKLY motor-car service is now in operation from Mafeking to Potchefstroom and *vice versa*, the time taken in the single journey being 10½ hours, and the fare charged £5.

THE members of the Birmingham Society of Mechanical Engineers were recently shown over the works of the Wolseley Tool and Motor-Car Co., Ltd., at Adderley Park, Birmingham. They were greatly impressed by the variety of work in progress and the up-to-date methods used.

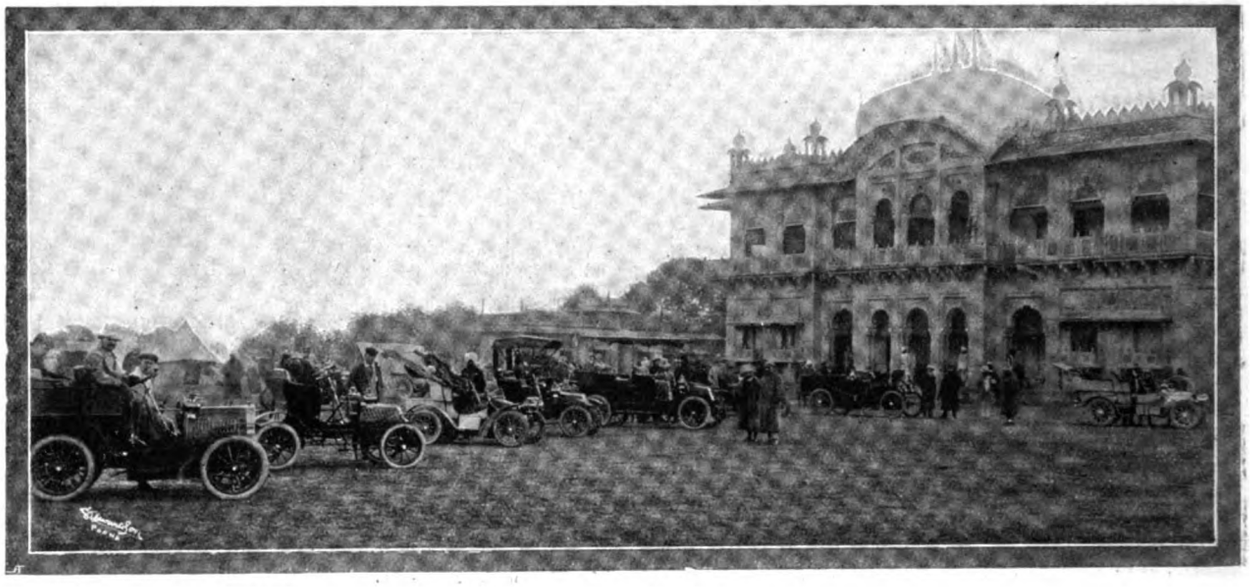
CONTINENTAL NOTES.

The Gordon Bennett and Grand Prix Joint Race.

The French Automobile Club, at its meeting last week, definitely decided that it will conduct annually a race to be known as the Grand Prix de l'Automobile Club de France, and that this year the event will be run at the same time as the Gordon Bennett. The rules that have been drawn up, to the number of twenty-two, have also been issued. They provide that the first fifteen cars in the French eliminating race shall be qualified to take part in the Grand Prix, and without the payment of any additional entry fee. The first three in the eliminating test, forming the team for the Gordon Bennett, will compete simultaneously in the two races. If, in the eliminating event, fifteen cars do not finish the entire course in such a way as to be qualified, the number will be completed by those cars which have passed the last preceding timing post before the hour fixed for closing the race. With this in view, besides the timing post at the finish there will be established three supplementary timing posts. For foreign cars entries will be accepted by invitation, and according to the following conditions:—Each country will have a limited number of cars in the Grand Prix, corresponding approximately to its relative importance in the automobile industry. The number of machines assigned to each country is as follows: France, 15; Germany, 6; Great Britain, 6; Italy, 3; Switzerland, 3; Austria, 3; United States, 3; Belgium, 3; total, 42; the numbers allotted to any one country including those which may compete in the Gordon Bennett. The amount of entry fee for the Grand Prix of foreign vehicles is £200 per car, this being apart from any sum payable for competition in the Cup contest. The foreign car or cars which form a team for the Gordon Bennett, and which do not pay this fee, will compete exclusively for the Cup, and any vehicle so entered will not be entitled, no matter what place it secures, to obtain a prize or classification pertaining to the Grand Prix. The manufacturers who use motors or mechanisms built according to an identical license, or under an arrangement in which the same name enters, cannot together enter more than three cars, this rule being applicable to all the vehicles entered without any distinction of nationality. Entries must be addressed to the Commission Sportive de l'Automobile Club de France, and will be closed on March 1st at 6 p.m. The vehicles competing for the Gordon Bennett Cup will start first, in the order prescribed by the rules. The other cars will start in an order to be decided by the drawing of lots, without distinction of nationality. The joint race is to be run in the first week in July, the precise date not having yet been selected.



◆ ◆ ◆

The A.C.F.'s Reply to the British Protest.

The protest sent by the A.C.G.B.I. to the A.C.F. against holding a joint race, which has already been outlined in the *Journal*, was next considered and a reply drawn up. The letter, which is dated January 19, and is signed by Baron de Zuylen, the president of the A.C.F., is a lengthy document, so that the following extracts from it must suffice:—

"It is correct, as you have read, that the Automobile Club de France has just promoted a new contest, called the Grand Prix de l'Automobile Club de France, and that, following certain rules and regulations, this international contest will take place on the same day and on the same track as the Gordon Bennett Cup. We are surprised that this news should have so disturbed the Automobile Club of Great Britain as to cause it to protest, because, if you will remember, our decision makes no innovation, since twice already, in 1901 and 1902, the Gordon-Bennett Cup was run accessory to the two principal contests, Paris-Bordeaux and Paris-Vienna, and at the latter contest an English car carried off the Cup to England. We drew up the regulations of the Cup, and it is thanks to our perseverance that the contest has achieved its present reputation. We think, then, that we are well in a position to say that, in spite of its importance, the Gordon Bennett Cup cannot be considered, as you call it, the 'blue ribbon' of automobile sport. By reason of the conditions the manufacturers are too little represented, and find themselves placed at a disadvantage one with another. Be assured that we consider the question with the most sporting impartiality, and we think that a contest fulfilling a programme like that of the Grand Prix will really bring together all the conditions necessary to make a race that the manufacturers of all countries will be glad to contest and proud to win. . . ."

A reply in somewhat similar terms has also been sent by the A.C.F. to the Swiss Automobile Club.

The Delhi-Bombay Trials. The Gymkhana at Gwalior

◆ ◆ ◆

Entries for the French Eliminating Contest.

Entries for the French eliminating trial are being sent in at a somewhat slow rate. The Panhard Company have entered three cars, naming Messrs. H. Farman, Heath, and Teste as the probable drivers; the C. G. V. Company one car, which M. Girardot will drive, and the De Dietrich Company three cars,

Digitized by Google

the drivers being respectively Gabriel, Rougier and Duray. Thus at the time of going to press only seven cars have been entered, notwithstanding that the list closes on the 1st February. The delay in entering may be due to the fact that some discussion has arisen with regard to the entry fee for the eliminating trial. As has already been stated in these columns, this has been fixed at £400 per vehicle. This figure is considered too high by many of the manufacturers, who are, it is reported, getting up a petition to the A.C.F. on the matter in favour of a reduction of the charge to £200.

◆ ◆ ◆

The Drivers of the French Cars.

The "Auto" is authority for the statement that one well-known French firm is paying its drivers £400 each to drive cars in the eliminating contest, a further sum of £1,200 being awarded to the successful man, should any of the team win the race. A similar fee will be paid for the Gordon Bennett and Grand Prix race, an award of £1,600 being given to the successful driver in case of victory. We append a list of probable drivers so far as they are at present known :—

Cars.	Drivers.
Panhard	Heath, H. Farman, Teste.
Mors	Salleron, Burton, Leger.
De Dietrich	Gabriel, Rougier, Duray.
Hotchkiss	H. Fournier, A. Fournier, Le Blon.
Richard-Brasier ...	Thery, Caillois, Stead.
Darracq	Baras, Hemery, De la Touloubre.
Clement-Bayard ...	A Clement, Hanriot and X.
C.G.V.	Girardot.

◆ ◆ ◆

The Progress of Magneto Ignition.

A striking feature of the interesting technical statistics of the recent *Salon* in Paris compiled for the "Auto" by M. Lucien Perisse is the section relating to ignition, which shows that the magneto system is rapidly superseding the high tension type by coil and accumulator. The appended table shows the proportions of the different systems of ignition found on the petrol cars at the three last shows :—

	1904. Per cent.	1903. Per cent.	1902. Per cent.
Magneto ignition	81	28	22
High tension ignition by accumulator or dry battery	19	72	74
Tube ignition	—	—	4

Subdividing the figures relating to magneto ignition it is shown that in 1902 only the low tension system was in use; the 1903 total was made up of 22 per cent. low tension and high tension 6 per cent. At the last show the respective figures were :—Low tension 26 per cent., high tension 35 per cent. It is also to be noted in the case of cars fitted with the latter more than half are also provided with accumulator ignition as a reserve.

◆ ◆ ◆

Carriage Builder and Tyre Manufacturer.

An interesting dispute has arisen between motor body carriage builders and tyre manufacturers in France. M. Michelin a few weeks ago offered a prize cup to the coach-builder capable of turning out the most comfortable carriage not exceeding a certain weight for a given number of persons. The idea was to bring down the weight of the body of the car as much as possible, as the present long *chassis* and commodious bodies are far from advantageous to the tyres, which under the existing conditions of weight and speed become a drawback rather than otherwise. The coach-builders are, however, indignant at the suggestion that their work proves a handicap to motoring, and Kellner, one of the leading builders, has offered a cup to the tyre maker (pneumatic or otherwise) who can manufacture a tyre capable of supporting any weight at no matter what speed. He considers that the weight is due to a considerable extent to the number of persons which the car is supposed to carry and to the spaciousness and comfort which have become a *sine qua non* of automobilism, and the actual coach-building has little to do in the matter.

The Delhi-Bombay Trials. Crossing the River at Kalyan.

◆ ◆ ◆

Motoring in Algeria.

The Algerian Automobile Club is organising a hill-climbing competition for February 23rd. It is to be held over a ten kilometre course on the Tablat-Sakamody road. The club is organising a contest for the Sueden cup on March 26th, a touring competition for the Broussais trophy on April 26th, and a driving competition for May 21st.

◆ ◆ ◆

Motor-Boat Racing on the Danube.

Following the example of the French Automobile Club in organising a series of motor-boat races on the Seine in connection with the Paris *Salon*, the Austrian Club is now arranging to organise a series of such races on the Danube, to be held at the time of the automobile exhibition in Vienna in March next.

MAINLY FOR LADY MOTORISTS.

By "Petrola."

THE "motor widow" has never been invented even by the most imaginative newspaper, though the sorrows of the lonely, neglected golf widow have been sung in many volumes.

But nobody has ever accused the motor man of the wife he left behind him when he went on a delightful tour. For motorists generally are nice men who do not take their pleasures singly; and only a motorist with a heart as solid as naval hard tack would go off on a tour of enjoyment without packing his feminine belongings into the tonneau. So that women do not need to feel jealous of the motor, although I must confess to a few heart-pangs when I read that two men actually fought a duel the other day on the Italian frontier over a motor-car.

Cherchez le car instead of *la femme* is a new kind of chivalry which tends to make women fear that they are losing their value, so far as sentiment and romance are concerned.

However, I regained my spirits, which had been considerably lowered by the motor duel, when I was told last week by a very well known car agent that motor trade follows weddings. The announcements of engagements in the fashionable papers are the signal for clever motor agents to send their car circulars to the happy couple. For there is always the chance, even if the bridegroom's finances are not equal to setting up a motor-car and a wife simultaneously, that the bride's parents, relatives and friends may club together to present a motor-car or electric brougham as a wedding gift.

It is well, however, to settle before marriage the problem a recent bride set before her puzzled better half. A motor-car had been given to her by a syndicate of prosperous relatives "on the occasion of her marriage." Her newly-wedded husband was most anxious to officiate in the driving seat, and took a course of lessons and a certificate of competence before the wedding day.

"But," said the bride, "it's my car, and in case of accident—if, for instance, you should run over and kill a pedestrian—should I have to pay the damages out of my private income, or would you be liable?"

She was a prudent young person. And the question she raised is interesting to husbands. As a matter of fact, with due deference to Mr. Staplee Firth, her husband as driver would be responsible for an accident. That is to say, if he committed an offence while on the car, he, not she, would be liable to fine or imprisonment. If solvent, he would, too, be called upon to pay the damages. And if he were not solvent—well, she shouldn't have married him!

But the law as to liability—save in the case of a hired driver in receipt of wages—would naturally make the husband responsible for any damage he committed whilst in charge of the car.

If, for instance, I stab somebody with another woman's hat-pin, she as owner is not held guilty of manslaughter.

Hence the bride-to-be can set her mind at rest. If she hands over the driving of her car to her spouse, he, not she, is liable to imprisonment, actions for damages, and the endorsement of the licence.

While on the subject of brides, I cannot resist recording the kind act of a chivalrous motorist well known at the Automobile Club. He lives at Hampstead, and not long since, when out on his car, he encountered a newly-married pair en route in a carriage and pair for Euston station. The best man and one or two guests followed to "see them off" to Newcastle, and, after the vulgar fashion of the day, were pelting them with rice and confetti, thus calling attention to the unfortunate blushing couple.

In a moment he drew up his car, invited the honeymooners to enter and outdistance their confetti-throwing friends. Most gratefully they accepted his kindly haven of escape, and in three minutes passed beyond the range of the rice and confetti persecution.

Motor Fashions.

I have been favoured with an early forecast from headquarters of the motor fashions which will prevail this late spring and summer.

But I would like to warn my feminine readers against buying all their new outfit too soon. For my part I shall wear out most of my winter things in the dark days of February, when one is too muffled up to hope to look smart. And by waiting prudently till the Motor-Car Show opens at the Agricultural Hall in March, I shall make sure of the newest, latest, and smartest car kit.

Nothing is so mortifying as to buy one's new clothes in February and then to run the gauntlet of feminine criticism from those who, with the wisdom of the wise, looked before they leaped into buying old winter styles for new spring ones.

Soft leather petticoats are being largely worn by lady motorists in charming shades of pink, grey, or white. No other material makes so warm and light an underskirt, with the great advantage that it takes up so little room that it does not add an inch to the waist measurement.

The motorina whose fingers are clever with the needle may buy plain leather or kid collars and cuffs, and ornament these with embroidery and steel beads, or beads to shade or harmonise with the colour of the coat they are to be worn with.

The plainest cloth coat ornamented with these most dainty accessories looks as smart and dainty as though it had come straight from a Parisian house.

Suede may be substituted for leather, and a toque of swathed suede or thin leather is not only very smart, but is weather proof and long wearing.

So-called "wheel rosettes" of suede, kid, or leather complete these smart toques. A motor lady of a substantial bank balance showed me her outfit for the Riviera, in which figured several white suede coats lined with various shades of velvet and trimmed with real topaz or amethyst buttons. To match each coat she had a silk motor cushion decorated with her embroidered monogram, each cushion packing neatly away into a leather case of the same shade, which was fitted with a handle and pockets for veils to match.

This is motoring of the "under a glass case" order.

The undersleeves of the white suede coats were of puffed silk to match both the shade of the velvet lining and the jewelled buttons. She informed me that suede lined with velvet is as cosily warm as a fur coat, while it does not destroy the graceful slender symmetry of the figure. White chiffon veils edged with lace, white gauntlets and white suede gaiters completed her fascinating though somewhat theatrical motor outfit.

For the Monaco boat races she had a supply of white silk rubber skirts and coats made in nautical reefer style piped with red or blue silk and decorated with silver gilt buttons with a motor boat design on each. A peaked yachting cap made of white Terry velvet piped to match the nautical costume and finished with silver gilt buttons gave the sea flavour to her outfit.

I hear a whisper that the newly-formed British Motor-Boat Club intends to admit ladies to membership. But I hope, both for the sake of their husbands' bank balances and the common-sense reputation of the Club, that *les skippeuses*, as lady motor-boatists are called, will not copy the wardrobe of this Riviera butterfly!

We learn that the Burlington Carriage Company, Limited, have secured the sole English rights in the Delaunay-Belleville car made by the St. Denis firm, whose water-tube boilers are used so extensively in the British and foreign navies. The cars, which are made in three sizes—16-h.p., 24-h.p., and 40-h.p.—will be on view at the Motor-Car Exhibition at the Agricultural Hall in March next.

NEW LOW-TENSION IGNITION SYSTEMS.

IN the "Continental Notes" in the *Journal* of the 7th inst. it was briefly mentioned that the Bullock and Simplex systems of low-tension ignition, first described in these columns, are attracting considerable attention on the Continent, where new systems on somewhat similar lines are beginning to make their appearance. As a result, we have been asked to give fuller particulars of the latest devices, two of which we are now able to illustrate.

Fig. 1 gives a general view of the Zubalof arrangement which is being introduced by M. Beaupied, of Paris. As will be seen, the apparatus, which is illustrated in full size, is so arranged that it can be fitted in place of the ordinary high-tension sparking plug. Referring to the sectional view (Fig. 2) it will be noticed that the central rod of the plug, by means of which the internal break in the electrical current is obtained, has an oscillating movement instead of a to and fro motion. The rod, or lever, is supported at the point of its centre of gravity on a spindle *S*, from which it is insulated by

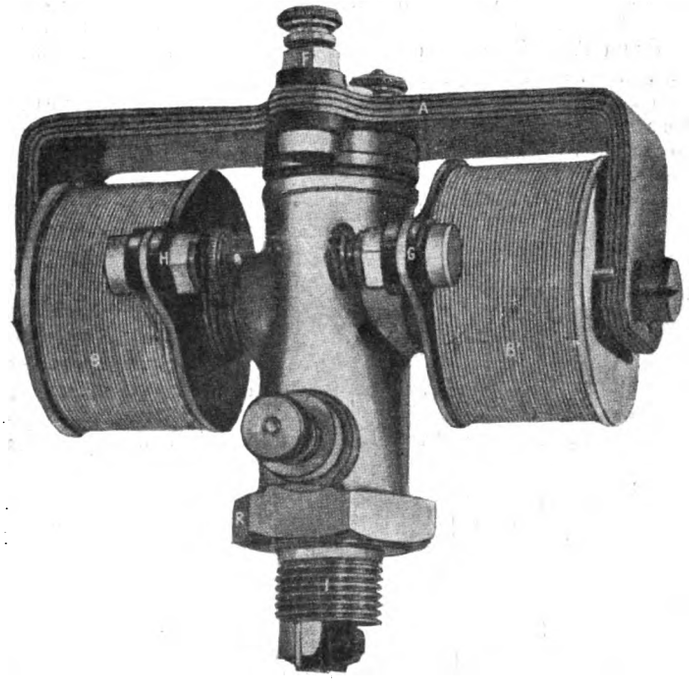

Fig. 1.—General View of Zubalof Ignition Device.

means of mica. The lower end *D* of the rod carries a hammer, fixed to it by means of a pin. The hammer, rod, and spindle are of nickel, while the end *O* of the rod is mica insulated. The electrical current, which may be furnished either by an accumulator, dynamo, or magneto, is divided into two portions. When the external break in the circuit is closed—that is to say, when contact is made on the contact maker on the half-time shaft of the engine the current flows through the coil *B*; at this moment the hammer *D*, or rather the lever *M*, is attracted towards *N*, and, turning on its spindle, causes the hammer *D* to make contact with the block *C*. This done, the coil *B*¹ in turn becomes magnetised, as a part of the current from the battery passes through the coil *B*¹, the lever, hammer and block, which are in series with it. The engine continuing to run, the external contact on the half time shaft is broken; the blade being on the insulated portion, current ceases to flow to *B*. The coil *B*¹ only is now magnetised, and attracts in turn the lever *M*, causing the hammer *D* to leave the block *C* suddenly, a large spark due to the extra current taking place between the two parts. The contact maker on the engine can, of course, be advanced and retarded in the usual way. The apparatus is strongly made, and will work in any position, a special claim being made for the fact that its regular action does not depend in any way on springs. The only parts subject to wear are the hammer *D* and block *C*; these will, however, last for several thousand miles, and are so attached that they may readily be renewed. The device is adaptable to single or

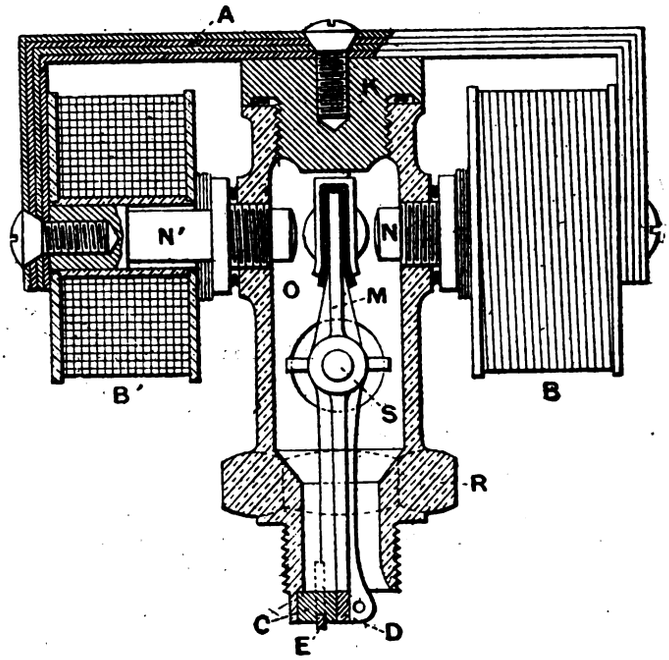

Fig. 2.—Section of Zubalof Ignition Device.

multi-cylinder engines, each cylinder being fitted with its own magnet and plug, wired up to the usual contact maker.

The Caron device, introduced by La Société Industrielle des Telephones, of Paris, is illustrated in section in Fig. 3, from which it will be seen that it is an exceedingly compact arrange-

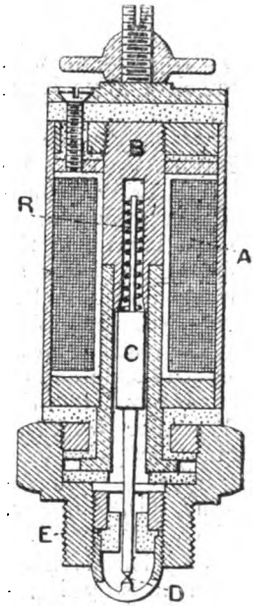

Fig. 3.—Section of Caron Ignition Device.

ment, the whole apparatus not being much larger than an ordinary plug, whose place it takes in the cylinder. As in the Simplex arrangement, the rod *C*, by which the internal break is obtained, has a to and fro motion. When the circuit is closed at the contact maker on the half-time shaft of the motor, an

Digitized by Google

electrical current flows through the coil *A*, magnetising the soft iron core; the latter in turn drawing up the rod *C* from the point *D*, a huge spark, due to the extra current, taking place when the rupture is made. A light spring around the rod returns the latter to its normal position, resting on *D*, when the external contact is broken. The only part subject to wear is the point *D*, which, as in other

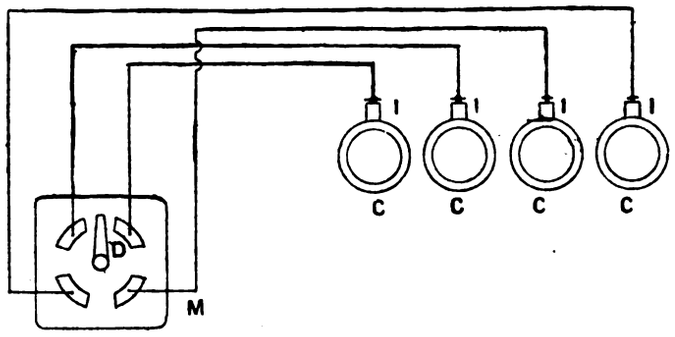

Fig. 4.—Arrangement of Wiring Caron Ignition on a Four-Cylinder Motor.

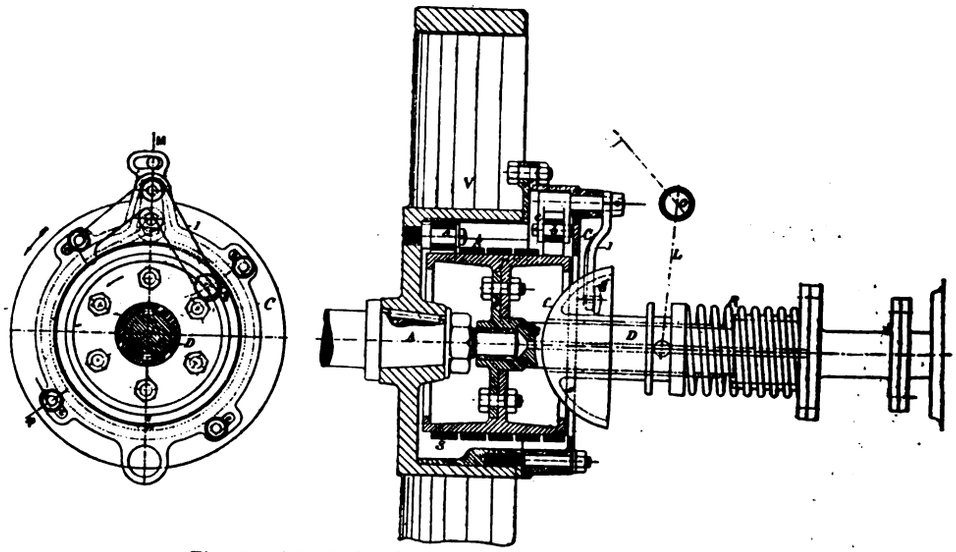
devices of the kind, can be renewed at a small cost, the renewal only being necessary after several thousand miles of running. Each cylinder is provided with its own combined magnet and plug, and while it will work equally well with accumulators and a contact breaker of the usual type, the Société des Telephones prefer to use a special low-tension magneto driven off the half-time shaft to furnish the primary current. The magneto is of the four-pole type, and has a rotatable armature; it furnishes two supplies of current at each revolution of the crank shaft, the current being sent by a distributor successively to the terminals of a collector, which are directly connected with the plug magnets, the number of terminals corresponding to the number of cylinders. Fig. 4 shows the method of connecting up a four-cylinder engine.

Messrs. Rochet and Schneider, Limited, is the title of a new company registered, with a capital of £300,000, to acquire the business of La Société Lyonnaise de Construction d'Automobiles Rochet Schneider. Société Anonyme, at Lyons, and to adopt an agreement with the Anglo-French Automobile Syndicate, Limited.



Mr. A. G. Dickinson recently made an interesting run on his Little Star car. He left Willesden at 10.10 on a Friday morning, intending to reach Newark, but, owing to a strong gale which was blowing in the afternoon, he was obliged to stop at Grantham. The following day he left that town at 7·50 a.m., and reached West Hartlepool at 5.15 p.m. The roads as far as Grantham were in a very bad state, and on arrival at that town hardly any part of the car was visible for mud. After Grantham the roads were dry, but in many places long stretches of unrolled new metal were encountered; notwithstanding this, however, the car went through without any trouble.

A useful little accessory for motorists is a Double Purpose Can recently introduced by Messrs. Brown Bros., Limited, Newman Street, London, W. The can is fitted with a funnel-shaped spout provided with a strainer of wire gauze, and can be used with either petrol or water. To fill the reservoir all that is necessary is to pour out a supply of petrol or water into the can, and insert the end of the funnel in the usual filler, when the reservoir can be filled without any waste.

THE MERCEDES COIL CLUTCH.

One of the features of the Mercedes cars is the clutch, which differs in several respects from that previously employed. Two sectional views of the clutch, which is of the coil type, are given herewith. The arms of the engine flywheel V are formed to act as a fan to draw air through the radiator and round the motor. The central portion of the flywheel is provided with a hollow drum within which the clutch is located. The steel drum T, on which the coil S is wound, is fixed to a flange at the end of the change speed gear shaft by means of six bolts. The shaft is supported at its forward end on a pin projecting from the end of the crank shaft, it being counterbored and provided with a bronze sleeve. The ends of the coil are bent round to form a loop. The fixed end of the coil is secured to a stud bolt *a* screwed into the web of the flywheel, and the tension is applied to the opposite end, at *b*, the loop at this end of the coil being fixed to a forked lever C fixed to a shaft, which also carries the lever *l* provided with a roller. The lever *l* is moved around its pivot support by means of a semi-spherical turned head *f* of hardened steel. The manner in which tension is applied to the movable end of the coil is at once apparent. The coiled spring R acts on the sliding collar D and forces the semi-spherical head *f* in the direction of the flywheel, thereby forcing the lever *l* outward from the clutch shaft and drawing the coil S tight on the drum T. When it is desired to disengage the clutch the sliding sleeve D is withdrawn from the clutch by the pedal, which compresses the spring R. The lever *l* then automatically approaches the centre of the clutch shaft. All tension on the free end of the spiral is then removed, the spiral automatically unwinds and the clutch is disengaged. A play of one-half millimetre between the interior of the convolutions and the outer surface of the drum suffices to insure perfect freedom of the clutch.

To allow of adjustment being made for wear, the cover C, in which the operating lever of the coil is supported, is provided with oblong circumferential slots, through which pass the bolts securing it to the clutch drum, and can by this means be slightly adjusted in a circumferential direction. By varying the position of the coil on the drum it is possible to limit the maximum power which the clutch will transmit. The coil and the drum are lubricated, and the interior of the flywheel is provided with passages

Figs. 1 and 2.—End and Sectional Views of Mercedes Clutch.

to insure copious lubrication and to retain the lubricant. All parts are protected from rust. The advantages claimed for this type of clutch are its smooth working and ready adjustment and the small moment of inertia, a point which will be realised when it is remembered that the clutch drum has a diameter of only 6·4 inches for a car of 60-h.p.

USEFUL NOTES.

FULLER'S earth, which can be obtained from almost any chemist, is a good dressing for a slipping friction clutch.

◆ ◆ ◆

THE heat of the exhaust pipe or silencer will melt the insulation of the high tension cable, if too close, and cause a fault.

◆ ◆ ◆

IN mapping out a route, so to speak, for locating troubles, begin with the most likely points and work down towards the more remote possibilities. A little experience will show which points in one's particular car should be the first to fall under suspicion.

◆ ◆ ◆

SHOULD an engine prove refractory in starting in cold weather, petrol squirted into the cylinders very often overcomes the difficulty; or, if the mixing chamber has a removable top with a cone, warming up the cone will nearly always effect a ready start.

◆ ◆ ◆

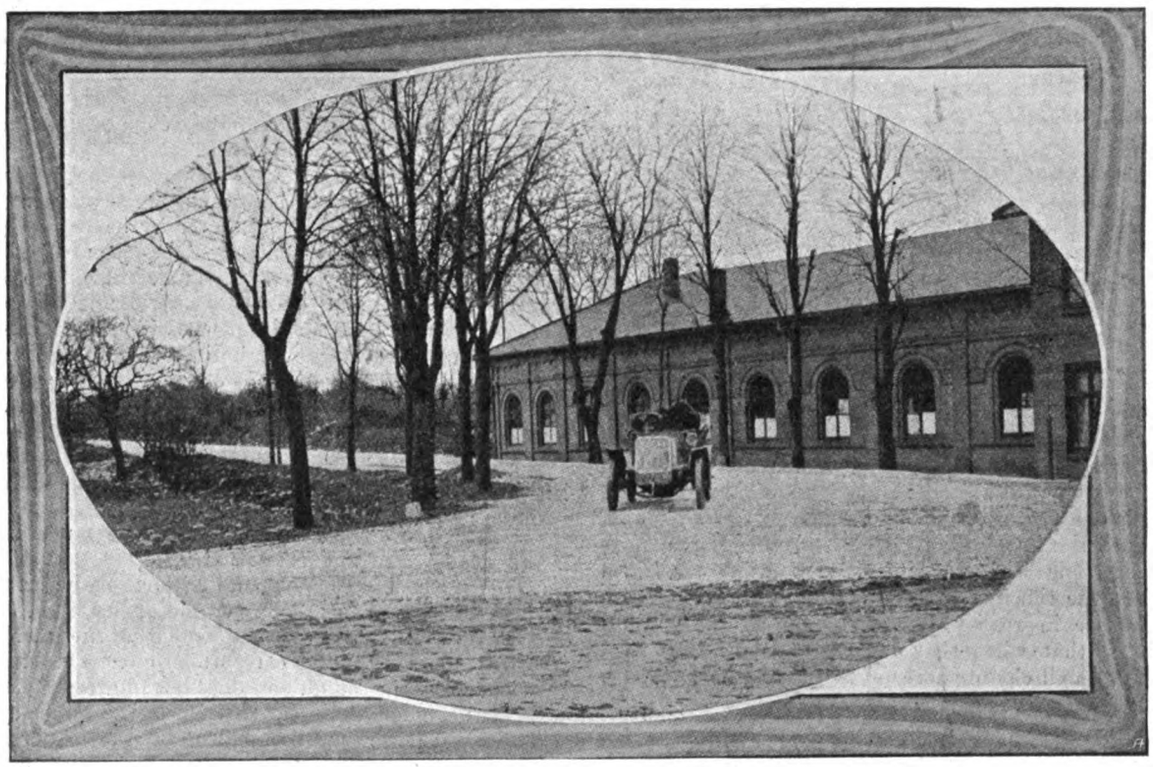
MOTORISTS who make a practice of carrying a spare set of fully charged accumulators should give these an occasional turn and turn about with those in regular use. Such a practice improves the batteries, prevents them from sulphating up, and renders them easier and more economical to recharge.

◆ ◆ ◆

BEGINNERS should make a study of the anatomy of their vehicles, or they never will become intelligent or satisfied motorists. The comfort of knowing how to repair any of the minor causes of stoppage can only be estimated when they come to grief miles away from any one capable of doing the repairs or adjustments for them.

◆ ◆ ◆

SOME people have been troubled to know why, on some occasions, their gears jump out of mesh. It will usually be found that this occurs on cars in which the clutch-shaft carries the sliding sleeve, and if the sliding sleeve is too tight or too loose a fit upon its square when the clutch is either withdrawn or engaged, the gears may be carried with the shaft. It should be noted that this cannot happen if the speed lever quadrant is fitted with square slots.



SOMETIMES a motor may suddenly stop from the failure of the exhaust valve to seat properly. This may be due to the warping of the valve through the engine having run dry and become too hot, or it may be from the failure of the closing spring or the sticking of the valve stem in its guides. The valve should be removed, and the stem cleaned and scraped—or straightened if it requires it, until it moves freely in the guide—and the closing spring given its full tension. If the valve still leaks so that the engine will not start or develop sufficient power, the valve will have to be ground into its seat.

◆ ◆ ◆

THE construction of some cars, and the carelessness of the owners of some others, make it possible for oil to reach the tyres and accumulate thereon. It would appear unnecessary to state that oil is extremely injurious to rubber, and, if its reaching the tyres cannot be prevented, its accumulation should not be permitted. Enclosed live axles are often filled too full of oil, with the result that when an incline in the road is reached it works out through one outside bearing and down the spokes to the tyre. To remove oil from a tyre, the safest method is to first wipe it off carefully with a dry cloth, and after this rub the parts which were covered with French chalk. The chalk should be dusted on to the cloth and rubbed vigorously over the tyre.

◆ ◆ ◆

SOME water-circulation systems are so poorly designed that steam pockets may be formed in some portion of the tubing, interfering with the continuity of the circulation; or the pump may be worn out and have lost its efficiency. In both cases the cooling effect suffers; the cylinder, overheated, ignites the gases before they are properly explosible, the valves become coated with carbon or deformed by the heat, and do not seat properly, or the exhaust-valve stem seizes in its guide or is lengthened by the expansion from heat until it will no longer permit the valve to be entirely closed. On a hilly road these effects of overheating, even if present only in mild degree, may stop the motor; but a short rest to examine the cause reduces the overheated parts to their normal temperature, and the motor can again be started. Often the trouble is due simply to an insufficient amount of water in the cooling system.

MOTOR CYCLING NEWS

A somewhat novel system of belt and chain transmission for motor-bicycles has lately been introduced by Messrs. Jules Bruey and Sons, of Ronchamps, Upper Savoy, France. As will be seen from the accompanying sketch, on the engine shaft is fitted the usual pulley B, of small diameter, encircled by an endless belt. On a bracket attached to the back fork is another belt pulley B^1. and formed with it is a small chain wheel C with about ten teeth, which gear into a chain fitted into the trough of a large diameter drum attached to the back wheel. To start the motor, the rider slackens the small pulley on the bracket on the back fork ends by means of a lever J on the top tube. He

then pedals along until the machine attains a certain speed, and by carefully tightening the belt by means of the lever, the small chain wheel is forced to turn and pick up the chain in the trough which drives the back wheel. The large diameter drum on the back wheel is also made use of for the purpose of a band brake. The trough-shaped rim is of special design, and consists of a six-spoked wheel carrying a double-rimmed periphery, each arm being attached to the rim by means of pins with rollers. These pins and rollers are in reality so many of the ordinary chain pins and rollers, so that when they come into engagement with the teeth of the small chain wheel on the bracket, they pass freely in the same manner as the rest of the chain links.

The report presented at the first annual meeting of the Manchester Motor Club showed that there are 72 motor-cyclist and 32 car members, some of the best-known motorists in the North of England being amongst them. The newly-elected officers are:—President, Mr. George Spencer; vice-presidents, Messrs. F. C. Hunt and S. B. Haynes; hon. secretary, Mr. J. Fraser; hon. treasurer, Mr. T. Kilfoy; club captain, Mr. P. T. Butler.

The International Motor-Cycle Cup Race will take place in June—probably the 18th or 25th. Entries for the British eliminating trials in connection with the event are now being invited. The present intention is to make the occasion of the home eliminating tests a means to promote a big international fifty kilogramme motor-cycle race meeting. The fund which has been started for defraying the expenses of the winners of the qualifying test when representing Great Britain in France is increasing most satisfactorily, and it is probable that the preliminary race will take place in the Isle of Man.

The annual dinner of the Birmingham Motor Cycle Club at the Crown Hotel, Birmingham, was an enjoyable meeting. Mr. H. Austin presided, and in proposing the toast of "The Club" remarked that although he did not ride a motor-bicycle he did the next best thing, he drove a motor-car. Responding, Mr. J. R. Bedford (hon. sec.) gave some particulars as to the club runs, which now took place fortnightly, the average attendance at which for the past season had been twenty members. The club contests had proved a great success, and the club had a balance in hand at the end of the year's working of £20. It has now seventy members.

THE REDUCTION OF NOISE

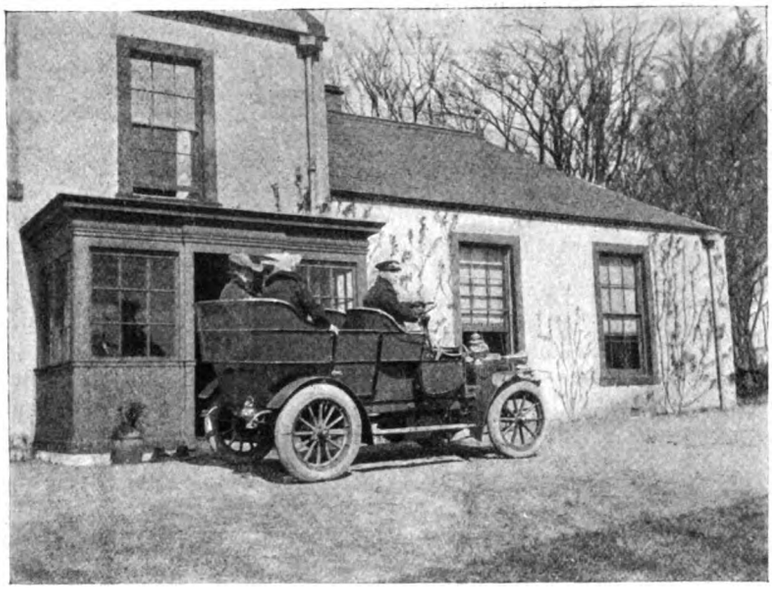
ONE of the most noticeable improvements in petrol cars is the great reduction in the noise of their operation. It is not too much to say that the first-class petrol cars of 1905 are free from any reasonable objection on this account. Indeed, the operation of some of them is attended with no more noise than that produced by a steam or electrical vehicle which have long presented in this one respect an ideal hitherto unattained by their competitor.

Among the causes of the improvement noted may be mentioned the increase in the use of multiple cylinder engines, particularly those of four cylinders; the general adoption of the direct drive on the high speed; the provision of large and more efficient exhaust silencers and of means of silencing the suction into the carburettor; the more careful design and construction of valve gears, and a general improvement of mechanical construction.

A considerable portion of the noise hitherto so objectionable an accompaniment of the use of single-cylinder petrol cars was due to the intermittent character of the engine power and the lack of balance of their motors. Not only did this mean an infrequent exhaust of large volume, difficult to silence without back pressure, and decidedly noticeable on account of the very sensible time elapsing between the "puffs," but it also made inevitable large fluctuations in the angular velocity of the moving parts, and variations of the driving torque at the engine through very wide limits, and at times from a positive to a negative value. The latter condition, especially, gave rise to knocking and rattling sounds, particularly in the engine itself, but noticeable as well in all other parts of the driving mechanism where any backlash existed.

The four-cylinder engines, now so much used, produce a practically constant rotational velocity and a driving torque which is sensibly constant and without change of sign. This is virtually true of three-cylinder motors as well. Cars equipped with these engines are nearly free from the rattle and knock to which single-cylinder cars are prone. The exhaust, too, is a nearly constant sound, and does not impress the ear so markedly as does the definitely periodic puff of the single-cylinder engine. The slight noise that is produced by the modern multi-cylinder engine is more of a hiss or subdued rustle than a combination of rattle and puff. The clicking of the valve mechanism and the mild sound of the exhaust are its principal components. The very hollow and objectionable gasp of the air entering the carburettor has also been much ameliorated by proper division of the inspirated air and by the better design of the passages.

Gear noise has hitherto always proved a very objectionable element in the sound produced, and the recent general employment of a direct drive on the high speed has largely eliminated this. Since modern cars are of high power in respect to their weight, generally geared rationally, and propelled by engines under a very wide range of throttle control, it is seldom necessary to use other than the direct drive, except in starting and hill climbing.



It has become generally recognised, remarks the "Horseless Age," that a large silencer is essential to a quiet running car, and that no artifice in construction can make up for the disadvantages of small gas capacity without the danger of introducing back pressure. Capacious silencers are thus the rule on the best cars. It is, moreover, far easier to silence the exhaust from the relatively small cylinders of a four-cylinder motor than from the one or two cylinders of an engine of the same horse power.

HERE AND THERE.

THE Gordon Bennett eliminating trials in the Isle of Man will be held on May 30th, or as near that date as possible.

MR. M. J. MACGREGOR, of Edinburgh, whose 12-h.p. Beaufort is depicted in the accompanying illustration, writes in enthusiastic terms of the behaviour of the Collier tyres fitted to the wheels of his car. He writes :—"The tyres have now done 8,560 miles in the last eight months, without a single puncture, and have been over some of the very worst roads. I have just finished a trip round Scotland of 860 miles, and went over the Pass of Glencoe, where the roads are very rough. The front tyres have never even been pumped up in the last nine months."

Mr. M. J. Macgregor's 12-h.p. Beaufort at Corsbie, Earlston, Berwickshire.

COMMENCING next month, the Great Western Railway will run a rail motor-car service once daily on the main line from Chippenham to Bath and back.

SIR THOMAS LIPTON has presented a claim to the Southampton Corporation for £167 10s. as compensation for damage recently caused to his motor-car in an accident due to alleged negligence of the local authorities. The Works Committee of the Council has recommended the payment of £125 in full settlement of the claim.

AT the next meeting of the Committee of the A.C.G.B.I., Mr. Claude Johnson will move a resolution, "That in all races and competitions held under the rules of the Club in future, including the race for the Tourist Trophy, the number of entries of cars made in a foreign country should be limited to two cars for every five British cars entered."

WISLEY Hut, near Cobham, would seem to be as popular with Surrey motorists in winter as in summer. We ran down there on Saturday and found fully twenty cars had arrived before us. The scene was a bright and unusual one, for the lake was frozen over and many people were indulging in skating. The combination of motoring and boating is familiar, but that of motoring and skating is a new experience.

MESSRS. MONTAGUE HAWNT AND CO. have appointed Messrs. J. E. Denness and Co., of Easy Row, Birmingham, as their agents for the Midlands.

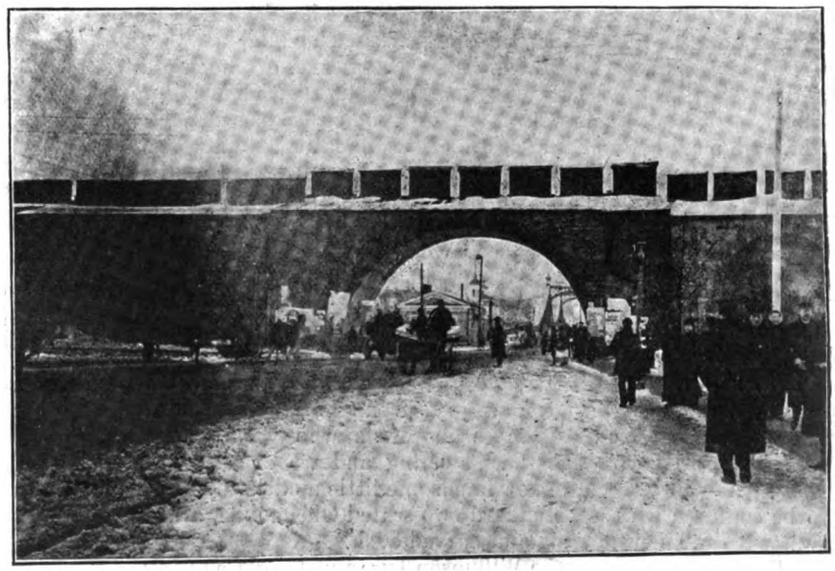
EARL DE LA WARR, Mr. John Kerr, M.P., Sir E. P. Duncombe, Bart., and Major the Hon. E. S. St. Aubyn have been elected to membership of the Automobile Club.

THE formation of the Automobile Club of Andalusia is announced from Madrid.

Two more double-decked motor-omnibuses have been put into public service at Eastbourne.

MR. W. BECKET-HILL has consented to read a paper on "Motor-car Break-downs and Incidents on the Road" before the members of the Liverpool Self-Propelled Traffic Association.

THE Mutual Garage and Motor Association, Limited, has been registered with a capital of £10,000 to adopt an agreement with Messrs. F. Bryer and C. L. Baker.



MR. PERCY FROST SMITH has been appointed engineer and manager of the motor-omnibus department of Messrs. Thomas Tilling, Limited, who are developing motor-'bus services in London.

MESSRS. WHITEHALL AND CREWE, of Week Day Cross, Nottingham, have sent us a sample of graphite suitable for use in connection with the lubrication of petrol motors and the gear cases of cars. It appears to be very finely ground and free from grit.

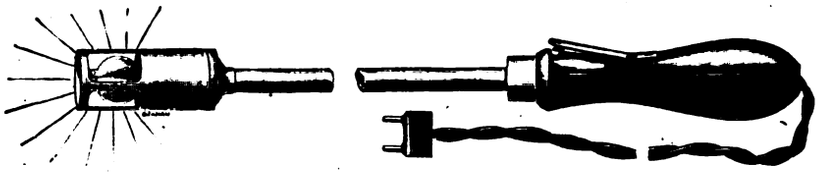
THE MOTOR-CYCLE AND MOTOR-CAR ACCESSORIES COMPANY, LIMITED, has been registered with a capital of £2,000 to adopt an agreement with Mr. C. Fonteyn, and to carry on the business indicated by the title. The registered office is at 35, Lamb's Conduit Street, W.C.

MR. REGINALD BONSOR, son of Mr. Cosmo Bonsor, ex-M.P. for Wimbledon, has sustained severe injuries as the result of a motor-car accident. The steering gear is reported to have gone wrong on a decline on the Great North Road, and swerving on to the grass the car overturned on its owner, afterwards rolling over again and crashing into the ditch by the roadside. The car was completely wrecked.

THE automobile dealers of New York are congregating on those few blocks of Broadway just south of Central Park and the Columbus Circle at Fifty-ninth Street. The Panhard Company's new branch is near Forty-fifth Street, "in the midst," London agents will be interested to know, "of the surging life of Longacre Square."

Motoring in Russia—A Snapshot from Nijni Novgorod.
[*La France Automobile.*

MR. BALFOUR and other Cabinet Ministers are expected to be guests at the eighth annual dinner of the A.C.G.B.I. on the 15th prox.



A GARAGE has been opened on the Radford Road, Nottingham, by Mr. F. Mitchell, who also stocks petrol and accessories for cars. An inspection pit is part of the equipment.

Digitized by Google

An Automobile Club is being formed for the Isle of Thanet.

During last year 197 automobiles were registered in Stirlingshire.

The Bristol Electric Safety Lamp Works, Westminster, S.W., has recently introduced an electric torch lamp, consisting of a miniature lamp-holder, with a handle of suitable length attached, in which is provided a switch. The lamp is well protected, and very light and compact; it will pass through an aperture of less than 1⅛ in. diameter, is well adapted for the inspection of the mechanism of motor-cars, and can be used in conjunction with an ignition cell.

The King of Siam is the latest addition to the list of royal motorists, he having acquired a Rambler car.

The Lohner-Porsche Company, of Vienna, have lately completed a 70-h.p. combination petrol-electric car for Count Siegfried Wimpffen.

A Stoewer 12-15-h.p. double-cylinder omnibus has lately been put in service at Novorossysk, in the Caucasus. The vehicle has accommodation for sixteen persons.

The Mechanical Development Syndicate, Limited, has been registered with a capital of £9,000 to adopt certain agreements, and to carry on the business of motor-car manufacturers, etc.

The Heaton Moor Motor Works and Garage has been opened at Birch Avenue, Shaw Road, Heaton Moor. Facilities are provided for the storage of ten cars, the supply of petrol, spare parts, etc.

The result of an inspection of our waterways, extending over eleven years, and necessitating travelling a distance of more than 14,000 miles, appears in Bradshaw's "Canals and Navigable Rivers of England and Wales."

The receiver and manager of the Motor Manufacturing Company, Limited, wishes to point out that the business is being carried on as usual, and confidently hopes will be so carried on after the company has been wound up.

Messrs. Hughes, Butterfield Brothers, of Stechford, Birmingham, have brought out a useful circular with lighting-up table, identification marks, table of cylinder capacities, etc. They are making a special feature of accumulator repair work.

The Lancashire Steam Motor Company, Limited, Leyland, have sent us a copy of a pocket diary they have just issued, and which is one of the most attractive productions of the kind we have seen. The cover, which is of celluloid, is of unusually artistic design. In addition to the diary portion a number of pages are devoted to postal and telegraph rates and other useful information.

The illustration on page 984 depicts Mr. W. M. Letts, of Messrs. Jarrott and Letts, Limited, at the wheel of a new two-seated Oldsmobile that firm are just placing on the market to meet the requirements of those motorists who would like a moderate-priced car with wheel steering and a French type of body. As will be seen, it is a handsome little model, and is not to be confused with the standard two-seated Oldsmobile, which is fitted with tiller steering and curved dash.

The new price list of the Wilkinson Tyre and Tread Company, Limited, contains some well-executed illustrations of the tyres, treads, upper rims and upper covers placed upon the market by that firm. Considerable success has been achieved by the Wilkinson tyre and non-skidding tread. The upper covers are intended to provide a wearing tread attachable to the tyre without the necessity of subjecting the tyre itself to a second process of vulcanisation or necessitating the sending of tyres away for the purpose of having the treads fixed.

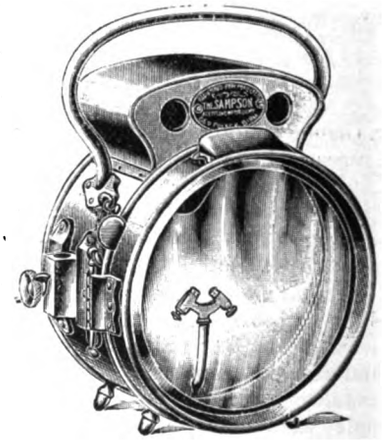
A car with a ten-cylinder engine has just made its appearance in Paris.

Between Kilmarnock and Glasgow a motor-van is now being employed daily by a firm of local carriers.

The Duryea Company, Limited, of Coventry, has gone into liquidation for the purpose of reconstruction, and Mr. Harvey Preen, of 17, Basinghall Street, London, has been appointed liquidator. In the meantime the work at Coventry is being pushed on with vigour.

The Birmingham postal authorities have contracted with the Wolseley Company to maintain a motor mail service between Warwick and Birmingham. Two special vans have been constructed for this service, which comes into operation on March 1st. These vans are of 12-h.p. and will normally carry a load of about one ton weight at from sixteen to eighteen miles an hour.

Dr. Harrison, the coroner for Mid-Sussex, makes use of the motor-car in journeying among the remote villages of his district.



A new motor steam fire engine, capable of turning out under full steam in sixty seconds for a call, has been ordered by the London County Council from Messrs. Merryweather.

The new calendar issued by Messrs. J I. Thornycroft and Co., Ltd., is illustrated with photographs of several notable motor vehicles produced by the firm.

Mr. P. P. Whitcombe has been appointed the official doctor to the A.C.G.B.I. Members will now be able to obtain medical assistance in the event of an accident in London or its environs. They may telephone or wire to the Club, and the Club will send the doctor.

A novel idea has been put into practice by a motor company in Toledo, U.S.A., a physician's emergency call service having been inaugurated, small enclosed touring cars being provided, in which doctors will be hurried to their patients at any hour of the day or night by drivers employed by the company.

Messrs. George Polkey, Limited, of the Hockley Lamp Works, Birmingham, have just brought out a new acetylene head light for motor-cars. It is known as the "Sampson," and is illustrated herewith. The twin burner is so arranged as to give a knife-edge flame to the front, which, in conjunction with a specially-designed reflector set at an angle to the flame, is claimed to give a maximum of light on the road with a minimum of glare to anyone approaching. At the eye line the reflector is dark, only the knife-edge flame being visible; at ground level the reflector is perfectly full, throwing a strong beam of light on the road. The reflector, which is 7 in. in diameter, consists of silver rolled on to a copper back. The burner is provided with a cleaning device, it being only necessary to screw up a button below the burner two or three times until the tip is clean, and then screw back the button as far as it will go. The lamp is supplied with or without generator as desired, and is provided with fork bracket fittings.

CORRESPONDENCE.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to "Boron," from the particulars given the trouble with the zincs might arise from the use of impure vitriol containing sulphate of lead, which would cause both the white deposit and waste, or from too large a proportion of pure vitriel, which would produce the same results. When the cells are not in use they remain active for any length of time, the zincs of course being removed. When in use the duration of activity naturally depends upon the number and capacity of accumulators. I find one charge of a four-cell Boron battery sufficient to charge from four to six 4-volt, 35-amp.-hr. accumulators before the battery is exhausted.—Yours truly,

H. Harrison.

To the Editor of *The Motor-Car Journal.*

Sir,—I have had over twelve months' experience in charging accumulators from primary batteries, and have used Boron cells in preference to others in batteries of 4, 6, 8, and 12 cells to suit the capacity of the various accumulators. For a 4 volt 40 amp.-hr. I use a 6-cell battery (in parallel of two threes) which charges the accumulator in twelve hours, one charge of the battery being sufficient to charge three accumulators of the same capacity if proper attention is given to the condition of the zincs and strength of acid used.

As to the cost of charging, I have found them very economical, but using large quantities. I purchase wholesale—Bichromate of soda at £1 12s. 8d. per cwt., 3½d. per lb.; zinc, 16s. per cwt., 1¾d. per lb; vitriol, 6s. per cwt., ¾d. per lb. At this rate one charge for six cells costs less than 4½d., and allowing 1d. for depreciation of zincs, gives a whole total of 5½d. as the cost of charging; this for charging three accumulators is less than 2d. per charge. This is, of course, the lowest possible estimate—using chemicals at wholesale price and exercising due care in the use of the batteries, but even when purchasing retail, with ordinary care, the charging should not be more than 3½d. per charge. I may add that during the past year I have charged hundreds of accumulators—from fifteen to seventy amp.-hrs., various voltages—with Boron cells working on the above scale, the result being perfectly satisfactory both to my clients and myself. —Yours truly,

G. Busschots.

A CYLINDER-COOLING QUERY.

To the Editor of *The Motor-Car Journal.*

Sir,—I should be very glad to know if anyone has attempted to keep the cylinder or cylinders of a small car, 6 to 12-h.p., cool without water circulation by using alternate mixtures in the cylinder of petrol gas and finely-sprayed water; the idea being that the finely-sprayed water would at once be turned into steam on entering the cylinder by the heat developed in the cylinder by the previous explosion of petrol gas, the cylinder being cooled by the finely-sprayed water every other explosion. If this idea is practical, it would do away with half the petrol bill and all the trouble of water circulation and radiators.—Yours truly,

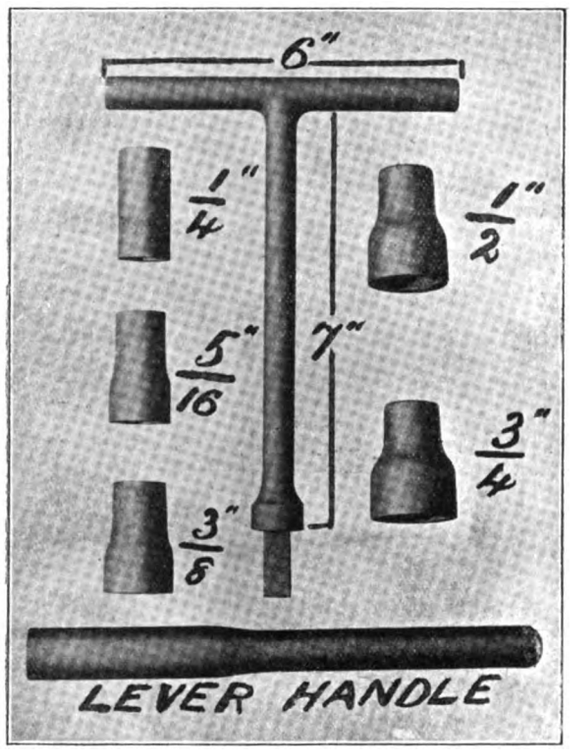
T. T.

COLD WEATHER PRECAUTIONS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have read with a great deal of interest the paper on the above subject by Prof. Henshaw, but, as the farmer said, I am no "forrarder." One thing, however, that he mentions is perfectly true, viz., the motor itself must give the verdict; what may be all right in theory may turn out in practice to be utterly valueless or worse. I am rather surprised at what he advocates might be tried, and will call his attention to the fact that caustic soda, even in very dilute solutions, and especially when warm, as would be the case in the circulating system of a motor, would in the course of a very few hours actually dissolve the fabric which is generally present in the rubber connections as fitted to most motors; its action would be worse than diluted glycerine, which softens the indiarubber only, but leaves the fabric intact. The writer is also unaware, evidently, that what is known as soda lye, the standard solution of caustic soda, contains about 5 or 6 per cent., only half the strength of what he recommends, yet this, when allowed to dry on the skin, often produces ulcers which are very difficult to heal—they are sometimes as bad as severe burns where the tissues are actually destroyed.

Last winter I wrote a few lines on the subject, but the point which I emphasized has been always overlooked; it is simply that a solution of any salt whatever, though lowering the freezing point and absorbing heat from the cylinder, will not part with it so rapidly as plain water, hence a larger radiator must be fitted to give an equal cooling effect. Why does not someone advise motorists who cannot arrange to store their machines where the frost cannot touch them to use something perfectly innocuous, say ordinary loaf sugar, that will reduce the freezing point, and will have no deterious effect whatever on any part of the mechanism? I do not say make a syrup, only a very dilute solution, else one might hear a repetition of the account which appeared in the newspapers the other day, where some locomotives were placed *hors de combat* by having had their tanks filled up with molasses instead of water, and which, with the heat, was converted into toffee.—Yours truly,



C. D.

THE "EUREKA" PATENT INTERCHANGEABLE SPANNER.

To the Editor of *The Motor-Car Journal.*

Sir,—I have the pleasure to send you a photograph of a tool which will, I think, be much prized by every automobilist in the United Kingdom. It is by far the most useful article I possess in my motor outfit. Having for more than two years tested its utility and durability, I can recommend it with absolute confidence. Unfortunately, few gentlemen take the trouble to dismantle their cars themselves, but those that do, and all mechanicians, will be for ever grateful when the Kennard "Eureka" interchangeable spanner is lying handy beside them.

Since I perfected this indispensable article a spurious foreign imitation, of cheap, inferior quality, has been "dumped" among us by Continental competitors, but with this important difference, that whereas the rival tool has badly fitting *cast* sockets, which spread open in every

day use, the "Eureka" is hand wrought from the best tapped steel Needless to say, the British manufacture stands wear and succeeds, while the foreign article fails altogether to satisfy. Two eminent civil engineers of Westminster, both ardent automobilists, have recently begged me to get them my spanner, at any price, and all who see it say it is precisely what they have long been looking for, I have therefore christened it the "Eureka." The spanner can be obtained from any of the important providers of motor requisites, and all sized sockets can be supplied. Individually, I find five amply sufficient for my requirements. I have the same tool, but smaller, included in my 3½-h.p. motor-bicycle outfit.—Yours truly,

Edward Kennard.

THE WAGES OF DRIVERS.

To the Editor of *The Motor-Car Journal.*

Sir,—Would some kindly disposed person, through the columns of your esteemed *Journal*, give a little advice to a would-be motor-driver? I am in good employment as caretaker in a large City office, but last August determined to take lessons in driving and repairs, in the hope of getting a country berth. I paid £5 5s. to a firm of instructors, and after a month's lessons, was given a certificate as an efficient driver and capable repairer. I got my licence and started looking out. I wrote to fifty-seven firms of car manufacturers and agents in London and suburbs and at last I had an answer. I was to go and see a lady near Regent's Park who required a driver, and her first question was, "What wages do you want?" I modestly replied about 30s. per week to start. "Oh," the lady said, "I couldn't think of giving more than 20s. to a trained driver, and

Digitized by Google

you are an inexperienced man." I am wondering if that is what I have spent so much money for.—Yours truly,

J. B.

THE EISEMANN HIGH TENSION MAGNETO IGNITION.

To the Editor of *The Motor-Car Journal.*

Sir,—I have been using this for a year and am very pleased with it. It wants a little understanding, however, and I have been unable to get full directions and explanation of the system, and therefore venture to write you.

(1) The Eisemann magneto on my car has its own coil, and has given every satisfaction, but the other day the engine suddenly stopped, and since I have been unable to get a spark on either of the plugs. Nothing appears to be wrong, all connections clean and light, no oil about. I have made all usual ignition tests. It is the Eisemann, as the plugs are quite right with the high tension accumulator system, which also has its own coil and is quite separate from the Eisemann. The two systems are never coupled up at the same time. I am expert and have solved all previous ignition troubles.

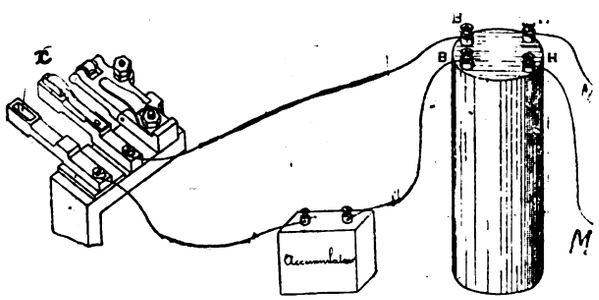
(2) When the Eisemann fails thus, what are the tests other than the usual ones of trying the plugs and wires, seeing to connections, etc.? How can one test the coil and magneto separately?

(3) Say the magneto is losing its magnetism; I take it, it would give gradually weakening sparks, but would it eventually and suddenly cease to give any spark at all, even with plugs in the open?

(4) The coil can be burnt out, I find. What causes this? How can one know if it has happened? What is the test?

(5) Does the Eisemann system suffer from cold?

(6) Is it possible for oil to gradually work inside the magneto and stop it working?



I shall be much obliged if you will advise me what may be wrong and what tests to make.—Yours truly,

Evan.

[We submitted our correspondent's queries to Messrs. G. T. Riches and Co., who, as the representatives of the Eisemann system in this country, are well qualified to deal with the points raised, and they have favoured us with the following reply:—

(1) From the sudden stoppage it is probable that the coil has broken down, although a breakage in the connection between the armature winding and the collecting brushes would have the same effect.

(2) The coil can be tested separately as follows:—Remove one of the carbon brushes, and from the same brush holder disconnect the wire con-

M. Wire to Distributor. N. Wire to Earth. X. Brush Removed.

necting it to the coil, and attach it to one terminal of an accumulator. The other terminal of the accumulator should be connected to the brush holder; the engine should now be started up, and if it runs steadily there is nothing wrong with the coil. To test the magneto, the wires connecting it to the coil should be detached, also the condenser wires which will be found on some of the later machines, which have a condenser under the arch of the magnets. If the armature of the magneto is now revolved a bright flash should occur at the platinum contacts; should there be none, it is the magneto that is at fault. The carbon brushes should be examined to see if they are free to move up and down in their holders, and also that they actually touch the copper collecting rings.

(3) Magnets gradually lose their magnetism, and consequently the sparking gradually weakens, but this would not cause the abrupt stoppage.

(4) If the coil breaks down, it is generally through its having been placed too near the engine, the heat melting the wax insulation. Attempting to start the engine after overhauling without the high tension or the earth wire properly connected up will put an undue strain on the coil and tend to produce internal sparking. Test as mentioned in paragraph 2.

(5) Cold has no effect on the Eisemann magneto.

(6) Owing to the construction of the bearings it is next to impossible for oil to work inside on to the armature, but, even if it did so, no harm would result.

We append a diagram showing how to test the coil. In the event of the breakdown of the magneto, the car can be run by connecting up with an accumulator or dry battery as per diagram.]

THE BEST WHEELS FOR MOTOR-CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Sir Hiram Maxim in a recent article said that the bicycle wheel was the strongest wheel made; if this is so, why is this type of wheel not universally used on motor-cars? One well-known firm that builds a sound—and heavy—machine uses this type of wheel exclusively, and apparently with entire success. Is it "the look of the thing" that makes the artillery wheel so universal? I must confess I prefer the appearance of the artillery wheel myself, and I don't think I should fancy my car with wire wheels now, but I did not fancy the pneumatic tyre on a bicycle when first I saw one. Suppose the interspaces of a wire wheel filled in with sheet steel welded accurately to the edges of the spokes, hubs and rim, would not a great increase of strength result? This would form the double disc wheel. Here is a type that differs radically in appearance from either form now used; it is found on some American racing machines and I have not heard of one breaking. It would be interesting to have the opinion of an expert on this type, as it appears to me to offer advantages all round. First as to weight, could it not be built as light as the wire wheel? Eighty pounds is not an outside weight for a strong artillery wheel with tyre. Second, ease of manufacture, and consequent cheapness. Steel stampings are not difficult or tedious to produce once the plant is in working order. Wire wheels are easier to make than artillery and much easier to mend.

An owner of a Lanchester writing in the *Journal* recently said that the wire wheel used on his car would carry one safely home with a number of spokes out. An artillery wheel in the same condition is to be avoided. When a spoke has to be replaced in an artillery wheel, the whole thing has to be rebuilt. As regards mending a disc wheel, would it ever require mending? Even rebuilding would appear simpler than mending a wire wheel. Third, appearance; this is a matter of opinion, but there is a smooth, frictionless look about the disc wheel that appeals to me; it suggests spinning like a top. Fourth, ease of cleaning. Very important, as anyone who has tried to clean four wire wheels ought to appreciate. The artillery wheel is bad enough, especially with side chains, but the disc wheel only needs a sluice of water and a wipe with a sponge. Even the wiping dry of such a wheel is done in half-a-minute. Would anyone who knows say whether the disc wheel could be used equally well with solid tyres?—Yours truly,

Robt. H. Armstrong.

THE LANCHESTER CAR.

To the Editor of *The Motor-Car Journal.*

Sir,—I shall be obliged if you will kindly allow me to correct a point in my letter on the above subject, published in the *Journal* of the 14th inst. It is in connection with the first two questions asked by "A. U." I said that "the main valve can be taken out in less than ten minutes." I should have said the "feed valve." The main valve takes much longer to get out. In the second question I give twenty minutes for taking out and replacing a broken exhaust or inlet valve. The "feed" or inlet valve could probably be changed in twenty minutes, but I expect it would take an hour to replace the main valve. The principal question is not much affected by this, as the breakage of either valve, or the necessity for grinding in, is in most people's experience unknown.—Yours truly,

Charles W. Dixon.

APPRENTICESHIP.

To the Editor of *The Motor-Car Journal.*

Sir,—I wish to place a boy just leaving school with a good firm of motor manufacturers. Will some reader inform me whether he must of necessity be bound to an apprenticeship, or would it be possible to get a firm to take him for a time on trial, as I feel doubtful whether he is physically strong enough for the hard work?—Yours truly,

X. M.

SPEED TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—I shall be greatly obliged if you can help me with your valuable advice on the following:—I have recently purchased a small 5-h.p. two-seated car, fitted with a two-speed Dupont gear. This latter was formerly driven by belt, but was altered to chain drive before I purchased the vehicle. My trouble is this: I cannot get more than eight miles an hour out of the car on top speed on the level, and then the engine is racing badly, and the noise too terrible for words. The car will climb gradients of one in eight with two up, so that there is a reserve in engine power. What I should like to know is—1. The drive is now fitted direct from engine shaft to back axle by Brampton chain. The sprocket on crank shaft has twelve teeth, and that on the axle fourteen teeth; approximate speed, four and eight miles an hour. What must I do to increase the top speed to, say, sixteen miles per hour, and will the increased speed be likely to make the car run quieter? 2. Will speeding up the car affect the hill-climbing power, and if so, to what extent? 3. Seeing the sprocket wheel is fixed on the engine crank, I should like to know if an increase of speed would strain the crank shaft and engine unduly. 4. Supposing you advise a larger sprocket wheel, must this larger wheel be fixed on the crank shaft or on

Digitized by Google

the back axle to increase speed? 5. If you think the Dupont gear unfit for chain drive, will you please tell me what I can best replace it with, and probable cost?—Yours truly,

T. 98.

[With regard to "T. 98's" trouble, there appears to be something radically wrong, as the gear from engine to axle is almost equal, and yet only four and eight miles per hour are got out of the car. The gear box must greatly reduce the speed unless the engine is very slow running. To get a higher gear it will be necessary to fit a larger sprocket to the engine shaft, say a 20 or 24-tooth. This would gear up to the gear box, which is a very unusual practice. The higher gear would also greatly reduce the noise. With regard to power, it would take a great deal more, but as our correspondent appears to have a reserve with his present gear, the car would no doubt negotiate ordinary hills. The strain on the crank-shaft would not be any greater than at present, as the engine would not race as it now does. The chain drive should run satisfactorily with the gear at present fitted.]

THE GRAPHITIC LUBRICATION OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal*.

Sir,—We have followed this matter in your *Journal*, so now we think it is time to let you know that we have used the above, mixed with oil and grease, throughout our motor over three years, with most excellent results. The engine is running as well to-day as three years ago, and has cost nothing beyond three piston rings six months back. We do not think the virtues of black lead are generally known, but in the lubricating trade it is acknowledged to have no equal for lubricating purposes. We supply very large quantities to the textile trade, some of the most expensive machinery being worked with it. The secret of its success is due to the fact that it must be fine and entirely free from grit; and all the lead we manufacture is, by a special process, rendered entirely free of any grit whatever.—Yours truly,

Whitehall and Crewe.

To the Editor of *The Motor-Car Journal*.

Sir,—In answer to Wilfred B. Wateyn, half a pound of graphite to the gallon of oil will be found sufficient. Add the oil slowly at first and mix well. Start the engine as soon as possible after the mixture is in the crank chamber to make sure of its being properly distributed. The pistons will carry up all that is required by the cylinders. Pure graphite can be obtained from Messrs. Townsend and Mercer, Bishopsgate Within, E.C., price about 1s. per pound. It is not necessary to add graphite every time oil is pumped in the crank chamber; if in constant use once a month will be enough.—Yours truly,

R. D. Bourman.

COURTESY ON THE ROAD.

To the Editor of *The Motor-Car Journal*.

Sir,—Doubtless you will have noticed in the general Press that I had to sacrifice my car to make room for a car which was passing in the same direction in Ridge Hill road, near Barnet. I should like particularly to point out the assistance and the courtesy I received from Mr. Frazer, the proprietor of the "Green Dragon" Inn. With regard to assistance which I asked for from another large motor, it was not so satisfactory. When I asked the owner to drive my two lady passengers to Barnet Station, in which direction their motor was going, they told me that they had no room unless the ladies would sit on the footboard, which offer I declined. This is the first instance I have met with during five years' motoring where gentlemen have not volunteered to give up their seats to ladies,—Yours truly,

F. Suter.

MOTOR INSTRUCTION.

To the Editor of *The Motor-Car Journal*.

Sir,—Your correspondent "Motoneer," in your issue of the 14th inst., has expressed a sensible view of what an automobilist should know of motor matters. Personally, my opinion is that we should hear considerably less of the incompetent chauffeur if his employer was in the position of judging of his (the chauffeur's) capabilities. We should also, for the same reason, hear less of the incompetent repairer and his exorbitant charges, etc.—Yours truly,

D. Doyle.

PROPOSED STEAM CAR CLUB.

To the Editor of *The Motor-Car Journal*.

Sir,—I think Mr. Murphy's idea of a steam car club an excellent one. At present one confesses to the ownership of a steam car with something like an apology; but, "Vis unita fortior," we may yet be able to hold up our heads with the petrol men. Will Mr. Murphy kindly furnish his address through the *Journal*, so that those readers who wish to communicate with him may be able to do so?—Yours truly,

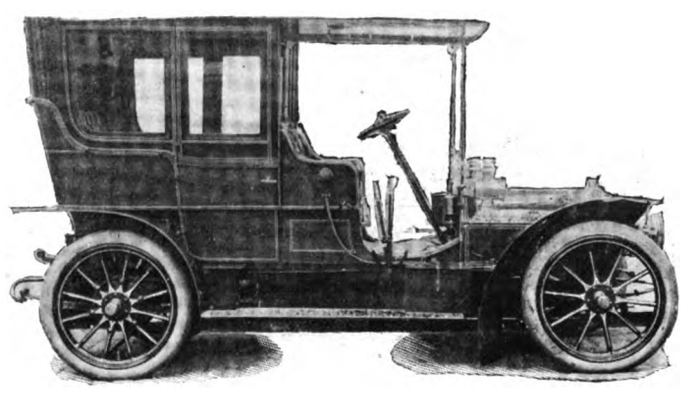
Steamer.

[In answer to "Steamer" and other enquirers, Mr. T. Murphy's address is 135, Cloudesley Road, London, N.]

To the Editor of *The Motor-Car Journal*.

Sir,—The suggestion as to the formation of a steam car club is excellent, and deserves the support of those motorists who have adopted this branch of automobilism. The proposal is by no means inopportune, for, owing to the prejudice against steam cars, this branch of the motor industry has made comparatively little progress. That such prejudice exists, and is assiduously fostered by the petrol motor trade, can scarcely be questioned, in view of the extremely unfair treatment meted out to steam car users in the matter of competition rules, when they are either entirely debarred from entry, or else hopelessly handicapped.

A matter I would commend to the earliest consideration of the steam car club that is to be is the fuel question, for I have yet to hear of the garage, outside London, which stocks, and will supply at a reasonable figure, C petrol, for to fill up one's tank at 1s. 6d. per gal. is costly.—Yours truly,



Vapeur.

EXPERIENCES WITH ENGLISH-BUILT CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—I shall be much obliged if you will publish my experience of an English-built car. I bought a 10-h.p. double-cylinder tonneau body car from the Motor Manufacturing Company last October twelve months, and had one of their men down for a fortnight to teach me. Since then I have driven the car myself over all the most hilly roads in the Devonshire district, and we have some very bad and steep ones, never sparing the car, nearly always with full load of four, and sometimes five; three people have learnt on her. Last October I ran up to London in the car with my man and luggage; it rained hard all the way, and took 14½ hours from my door, two miles from Tavistock, to Cavendish Square, 221 miles. Coming down I had my wife with me as well, and we did the journey, on dry roads, in 13 hours from start to finish; taking out stops, actual running time was 12 hours, being an average of 18½ miles an hour. These two runs and a run out of London made in all over 500 miles by the time I got home, which I did without any adjustments in any form to the car, engine or gear, and without an involuntary stop. I think this shows well for a 10-h.p. English-built car that had been running for twelve months over most hilly and bad roads.—Yours truly,

C. J. G. Still.

The Germain 16-h.p. Coupè Limousine.

WATER CIRCULATING PUMPS.

To the Editor of *The Motor-Car Journal*.

Sir,—Could any of the readers of the *Journal* kindly inform me the name and address of the manufacturers of a small rotary circulating pump similar to the one I have recently purchased. It is a very small and compact pump of the roller pattern, with cut grooves along the face and sides of the teeth, which form a water-tight sealed joint, and thus makes the pump very effective. I should much like to know the patentees of this pump, as several of my friends are looking for a good circulating pump.—Yours truly,

S. James.

TRI-CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—In answer to "Beginner," as a maker and rider of tri-cars, I should recommend for a three-wheeler that he buys a machine with 3½-h.p. air-cooled engine and chain drive, the machine being built as light as possible, cost say £40. If he feels inclined to go in for two-speed gears, free engine, water-cooled, with all attendant troubles, the best thing is to have a light four-wheeler, cost say £80. The licence fee and initial expenses will be a little more, but the upkeep of the four-wheeler will be less than the heavy three-wheeler. In the case of bad weather the four-wheeler is much better than the three-wheeler.—Yours truly,

A. Saunders.

Digitized by Google

AN INTERESTING MOTOR QUERY.

To the Editor of *The Motor-Car Journal.*

Sir,—I must apologise to Mr. Fortune's watch, but my excuse is that he did not, in his former letter, state that he had used it. There are so many variables in motoring, *e.g.*, condition of roads, wind, gradient, tyres, mixture, lubrication, and, last but not least, driving, that I do not think we need go to "higher atmosphere gases" to account for actual variations in power, which, by the way, are observable at all times of the day.

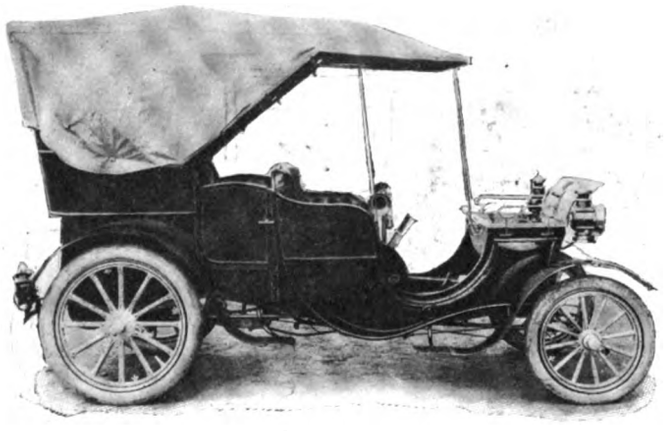
Anyone who has suffered from an overheated engine will readily admit that efficient, or rather inefficient, cooling will affect running to a far greater extent than noted by your correspondent. Assuming, of course, that your correspondent is not comparing his time home with his time out in the morning, a systematic consideration of the variables should disclose the cause of any actual increase of power, or at least, should bring it within very narrow limits.—Yours truly,

A. 710.

OVERHEATING TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—Referring to "J. L. L.'s" letter on overheating troubles, in your issue of January 21st, it appears to me that the whole cause of the same is that the exhaust silencer and pipe is choked with soot, etc.—Yours truly,



Arthur Burgess.

SPARKING TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—A short time ago I experienced misfires at high speeds although the car ran well enough slowly. On investigation I traced it to one of the tremblers on the coil, so took off the blade and screw, hammered them gently, replaced, and the trouble vanished. I should advise "Country Motorist" to try it. In reference to cracked water jackets, has any reader tried the Smooth-on compound largely used in America on marine boilers for stopping leaks?—Yours truly,

E. H. S.

The 1905 15-h.p. Duryea side-entrance Tonneau with Cape Cart Hood. The car has a wheel base of 8 ft. 6 in. with ample seating for three in the tonneau, or five in all. The weight complete is just over 16 cwt.

PRECAUTIONS AGAINST FIRE IN MOTOR GARAGES.

To the Editor of *The Motor-Car Journal.*

Sir,—The fires which recently took place at the G.W. Ry. Co.'s motor house in Cornwall, at the London Power Omnibus Company's depot, and at a big garage in New York, are evidence that such institutions are not always guarded with that excess of vigilance which alone is a guarantee of safety.

Anyone at all familiar with the average conditions existing in too many garages will have no trouble in assigning several probable causes for fire. The omnipresent cigar and the still more numerous and dangerous cigarette find in the modern garage a wide field of destructiveness. Another element of danger in the garage as compared with most buildings usually rated as extra hazardous is the use of petrol for cleansing purposes. Motor garages are now an absolute necessity in every large city; they cannot be banished to the suburbs, for they must be convenient to business or residential centres; and they cannot exist without a liberal supply of petrol. From even the narrowest point of view of self-interest, the proprietors of such institutions owe it to themselves, if not to the public, to observe every possible precaution against fire. The first element of safety is a definite system of authority and discipline by which the rules of the garage are stringently enforced at all times. There should always be present some one person whose duty it is to enforce the rules; if this task be divided among several persons or left to chance, all discipline will relax. There should be rigid regulations regarding the use of petrol, whether in filling the tanks of cars or in using it for general purposes about the garage. Second only in importance is the matter of general cleanliness—the prevention of accumulations of dirt and waste in corners and closets, the immediate removal of petrol and oil from the floors, and the maintainance of order and neatness throughout the establishment. With floors and lockers in proper order, and with all oil and petrol confined to their tanks, the possible danger from an accidental spark of any kind is reduced to a reasonably safe minimum. There is no guarantee of safety in the mere posting of placards prohibiting smoking, even though phrased in several languages; the only safety lies in the rigid enforcement of the rule by one central authority. The abolition of smoking will doubtless prove a hardship to many, but it has been found necessary in the case of theatres and similar institutions, and sooner or later it will probably be made a legal requirement in the case of garages in the central portions of cities.—Yours truly,

Precaution.

HINTS ON DRIVING METHODS.

To the Editor of *The Motor-Car Journal.*

Sir,—It would be interesting to have the opinions of your readers concerning the best methods of driving a motor-car. Few people are able to spare the time necessary for a course of lessons from competent teachers, and the majority have to rely upon themselves, or the advice of friends, who possibly were in a similar position a few months previous, but have worked out their own salvation in what seems a satisfactory manner.

Their method of driving may, however, be far from the best. One will drive by means of the ignition lever, while another will use the throttle lever. In running down hill there are more ways than one of arranging matters. One driver goes at it on the top speed, with motor running out of gear, relying solely on his brakes, while another stops his engine and uses it as a brake. Yet another will use the middle or low speed gear, with engines either working or switched off, or in or out of gear. Still another uses his foot brake with the hand brake in reserve, while a motorist of my acquaintance always uses his hand brake first. Other problems might suggest themselves, answers to which would make interesting reading and greatly assist those who are anxious to drive well.—Yours truly,

Prometheus.

A QUERY *RE* RUSTY WATER JACKETS.

To the Editor of *The Motor-Car Journal.*

Sir,—Can any of your readers tell me how to remove rust and lime from the inside of the water jacket of my engine? The water obtainable in my district is very hard, and contains much iron, and I cannot procure soft water.—Yours truly,

T. Fothergill.

[We would advise our correspondent to first remove as far as possible all the rust, etc., from inside the water jacket—this by removing water connection plug in the jacket, and scraping. After this is done, by using a small quantity of Boilerine or any composition used for preventing fur in boilers, the rusting and deposit will greatly be reduced.]

LEATHER FOR FRICTION CLUTCHES.

To the Editor of *The Motor-Car Journal.*

Sir,—I should be glad if you or any reader of the *Journal* could inform me as to the right kind of leather to use for the friction clutch of a motor? Also in removing the clutch for the purpose of renewing the leather, is it necessary to use clamps to overcome the spring?—Yours truly,

Lancastrian.

[The best leather for clutches is such as is used by harness makers, this being more pliable than that employed by shoemakers. For the shape it is best to first cut a paper pattern, all wing enough on the width for trueing up. The rivets must be let in the leather so as not to come in contact with the metal portion of the clutch. It is also advisable to turn up the leather after it is riveted on. For removing the clutch it is generally necessary to take down the gear box, no clamps being used. The releathering cannot be done satisfactorily with the clutch in position.]

The Purley Racing Track.—"Philippine" writes asking what has become of the scheme for a motor racing track at Purley, about which so much was heard a year or so ago.

Graphite for Lubrication Purposes.—Messrs. R. Humm and Co., Market Buildings, Plymouth, ask us to mention that they can supply superfine graphite in ¼ lb. tins.

Primary Charging Batteries.—The Boron Battery Company write:—"We beg to contradict the statement of the South Western Motor Company, in last week's issue of the *Journal*. The instruction given, as in all such cases, was to charge each 40 amp.-hr. accumulator with six cells in parallel; any other method, even if 500 cells are used, would only prove a failure."

Oldham Couplings.—"Inquisitive One" writes:—"I often see references to the term 'Oldham Coupling'; as I have failed to find a definition of this in several engineering dictionaries, I think it would be interesting to others as well as to myself if any reader of the *Journal* in a position to do so would inform us what an Oldham joint really is."

NOTES ON THE PARIS SALON.*

A FIRST glance at the stands at the recent Paris *Salon* did not reveal any striking novelties, and it needed a careful inspection to notice those improvements in details of construction which characterised the Exhibition. In general design, a distinct and welcome tendency towards simplicity was evident and less was seen of individual freaks. The French Exhibition appears to scorn the small car, more than half the vehicles displayed being rated at over 20-h.p. In fact, with a few noticeable exceptions, the small cars which attracted attention were not of continental make. Taken as a whole, there was very little indication of any considerable fall in prices, which I notice Mr. Siddeley has estimated to work out at an average of £40 per horse-power for four-cylinder cars. Other points brought out by the Show are the predominance of four-cylinder motors, the rapid adoption of magneto ignition, and the continued influence of Mercedes practice. Last year one saw everywhere the cellular radiator, the square bonnet, and the pressed steel frame which the Cannstatt Daimler firm had introduced. This year there has been a general copying of Mercedes practice in regard to change gear with two sliding sleeves, forward moving pedals, fly-wheel fans, sheet metal aprons, pressure-fed petrol. Just as the earlier model for builders was the Panhard, on account of its successful adoption of the vertical motor in front, the sliding gear, and wheel steering, so now it is the Mercedes which sets the fashion on account of the practical genius of its designers, coupled with care in selecting for each of its parts material of the most suitable composition, and disposing that material in the best way to stand the strains to which it is subject. We in this country, and our kinsmen over the sea, may certainly claim credit for greater originality of design than is found on the Continent, and when our products are seen fairly side by side with those of foreign makers, I do not fear the comparison.

In engines themselves no considerable change is general. Separately cast cylinders seem to be coming back to favour, probably because they are cheaper to repair, and permit a bearing between each crank. Light water jackets, mechanically secured around the cylinders, are giving place again to jackets cast with the cylinders. Cam shafts and their gears are now generally enclosed in an extension of the crank case, though others seem to take a delight in obstructing the front part of the machine with a gorgeous display of fibre and gun-metal wheels, some of them as big as those in the gear box. Pipework is greatly improved from the points of view of neatness and efficiency by the general adoption of shorter and more direct pipes of larger diameter. Considerable trouble has evidently been taken in many cases to place the carburettor symmetrically with regard to the engine, so as to avoid differences in suction on the carburettor on account of the differing lengths of induction pipes to the cylinders. The advantage of reducing the volume of the exhaust gases by cooling before reaching the cylinder is beginning to be appreciated, and gilled exhaust pipes for this purpose are in evidence; even water-cooled, in one case, where the exhaust valves must gain from this kind treatment.

Carburettors are noticeably simpler, though nearly all have some device which attempts to obtain automatically a constant mixture at all speeds of the engine, and with all degrees of throttling. A good deal of attention has again been given to water circulation, and though it has become recognised that a cheaply-made cellular radiator is a source of endless trouble, yet the advantages of this pattern in giving more cooling surface per unit of weight have led to its adoption on almost all the larger cars in preference to the cheaper flanged tube pattern, which is, nevertheless, as simple and strong as anything that has been designed. In a few instances natural circulation is relied upon, and there are some laudable attempts to make the engine more accessible by removing the radiator from the front of the engine to the dashboard. On the majority of cars there is at least one fan, and on many there is one in front close by the radiator and another in the flywheel. This second fan is, of course, only of use if there is a closed-in metal case under the engine, and in this connection it is curious how few firms seem to take the trouble to make their fan blades fit their surroundings. Unless the blades are almost surrounded by some sort of circular duct there must be waste, and the usual plan of having a few small blades spinning about at the centre of a large square radiator may, perhaps, churn up the warm air that is already under the bonnet, but it cannot materially increase the amount drawn through the radiator.

There is a tendency to omit the ordinary form of ball governor and substitute a throttling device, actuated from some medium whose pressure varies with the speed of the car, and which is necessarily there for some other purpose—for example, the Panhard hydraulic governor, worked by the pressure of the circulating water, and the Winton pneumatic governor, one of the simplest and most ingenious combinations for securing the correct mixture at all speeds, whilst at the same time forming an effective speed governor. Though there is still room for improvement, much has been done to avoid inaccessible parts. In particular it was interesting to notice that several firms have at last abandoned the idea that there is never any need to get at the big end bearings of the connecting-rod, and are now taking pains to so design their main bearings and engine supports that the lower half of the crank case can be dropped down without first taking everything else out of the car. It is also becoming appreciated that even if valves are correctly set by the makers originally, the inevitable wear makes it very desirable to have better means of accurate adjustment than has hitherto been usually given. To this end the Mors firm provides simple means of adjusting all valves separately, and the desirable practice of clearly marking the fly-wheel and providing a pointer to show the position of the pistons in the various cylinders is becoming more general. The acme of accessibility was reached in a most ingeniously designed engine, which it was possible to take completely to pieces in three or four minutes, and in most cases the device for obtaining this desirable result seemed mechanically sound. Though there is a natural reluctance to have an engine which might conceivably resolve itself into its constituent fragments unexpectedly, yet I shall be surprised if some of the features of this engine do not come into general use.

Perhaps the most marked improvement in any part of the cars is in the electrical accessories. With the strange exception of one of the leading models, we no longer see those straggling wires which used to be so conspicuous and troublesome. This is partly due to the more general adoption of magnetos, and partly to the greater care taken in rigidly supporting and encasing all wires. In this connection it is doubtful, however, whether the use of red fibre will prove satisfactory in view of the way in which its insulating powers are affected by heat and damp. Where the battery and coil are retained one finds few commutators hidden out of the way behind the frame, as was frequently the case hitherto. A vertical spindle for the commutator, driven by bevel gear, is now very usual, and allows a handy position to be chosen for it. It would be interesting to know whether the claim that the spark from a high-tension magneto is capable of igniting a mixture of 1 part of petrol vapour with 19 of air, whereas the weakest mixture which the ordinary induction-coil spark can deal with under the same compression is 1 in 15, is substantiated by experiment. It is surprising to find some of the well-known makers abandoning all means of adjusting the point of ignition. This is presumably done to avoid possible damage by an unskilled operator with the increased engine-powers now usual, but it can hardly fail to reduce fuel efficiency and to increase the noise of the exhaust. Unfortunately, the reactions which take place in the electrical systems of high-tension magnetos tend to retard the spark as the speed increases, and there would therefore seem less excuse than ever for a fixed point of ignition in this case. If it is really found that serious damage is often done by the ignorant when they are provided with means of altering the time of ignition, it would seem better to move it automatically by means of a governor rather than abolish it.

Turning now to the transmission, there has perhaps been more care bestowed on this part of the car than on any other. We see a continuance of the praiseworthy efforts of the past year to reduce the number of steps in speed reduction. The problem is becoming more involved to those who, like the Mors Company, are anxious to have the minimum number of gears in mesh not only on "top notch," but also on those speeds where power waste is most to be avoided—the hill-climbing gears. Many makers are awaking to the fact that the ordinary direct drive on top notch, which is so much liked for its silence, has the drawback of introducing two-gear reductions, with the corresponding loss of horse-power on the hill-climbing speeds. The cure sought has, in some cases, been the simple one of reverting to the old plan, as in the Panhard gear box of 1904, but to cut the gears more carefully to avoid noise. One firm obtained the economy of one reduction on the lower speeds by having two bevel wheels instead of one, as is usual on the differential shaft, one bevel for a high, and another for a lesser speed reduction. The plan seems good, the wear is divided between the two, so that both will remain undamaged for a longer period, and as the heavy work never comes on that bevel which is used on the level, the faces of its teeth are not likely to begin striking with that musical note which some motorists are perverse enough to enjoy.

Finality in clutches has not yet been reached, and a desire to secure some form of metal-to-metal clutch which will allow of gradual application is noticeable. Several forms of multiple ring or disc clutches running in oil were shown, one having three concentric rings, of which the inner one comes into operation first and the outer last. In another case an epicyclic gear is combined with the clutch, so that as the clutch is gradually let in the first action is to start the car moving on a lower gear through the epicyclic train, and then to lock the epicyclic gear and connect the engine direct to the transmission shaft. A well-ventilated and lubricated clutch which can be allowed to slip when desired may yet be the solution of the gear question. The extra loss of power in friction which this would involve beyond that in the numerous gears displaced is not a matter of very great moment when starting from rest, and the advantages from the point of view of simplicity and cost would be considerable. I know that the leather-lined clutch has given fair satisfaction and can slip, but continued slipping is impracticable between any surfaces which are not good conductors of heat.

In gear boxes the Mercedes pattern with two sliding sleeves seems the most popular, and there is a laudable desire to avoid bringing levers through the bottom of the gear-box and so encouraging waste of oil. One or two makers have realised the advantages of double helical or herring-bone gearing for diminishing noise, removing end thrust, and increasing efficiency. In almost all the larger cars the gear-box shafts are provided with ball bearings. Where live axles are used, the wheels more often take their bearings on the outside of the stationary tube than hitherto, so as to relieve the live axle itself from sagging strain. The users of propeller shafts have evidently felt the need of some elasticity in their transmission, and several forms of spring drive were noticeable. Bodies and body suspension show two very marked features. By far the large majority

* Extract from a Paper read by Mr. Edward H. Cozens-Hardy at the Automobile Club on January 19th.

Digitized by Google

of bodies exhibited were of the closed pattern, with side entrance, and apparently of considerable weight, and there was a noticeable tendency to increased length of spring.

Perhaps the occasion of the Paris *Salon* is a legitimate one for discussing the use of French terms. Personally, I see nothing wrong about the word "chauffeur," except printing it in italics and attempting to pronounce it as if it were French. It records automobile evolution from the days of steam, it is not a term of servitude like "coachman," or "motor-man," or "driver." It is a useful word, conveying as definite a meaning as the words "chassis," or "police trap," and does not imply too much, like "automobilist," or specialise too much like "steersman." Motoring has developed entirely since the days of newspapers and telegraphs, hence its new terms must become international, and the balance of indebtedness is well on the side of the Continent, where the words "sportsman," "moto-girl," "stop," "alright," "stand," "respectable," "speed," "gentleman," "square," "shocking," "barmaid," "record," "yes," "endurance," "touring," "club," have been found by the writer on one page of a French automobile journal this week.

THE BIRMINGHAM MOTOR SHOW.

THE first of a new series of motor exhibitions in Birmingham was opened in the Bingley Hall on Saturday last by the Lord Mayor of the city, Mr. R. H. Berkeley, and closes to-day (Saturday). Most of the cars on view have already been dealt with in the *Journal*, but a brief *resume* of the exhibits may not be without interest.

One of the largest exhibits is that of the WOLSELEY TOOL AND MOTOR CAR COMPANY, LIMITED, the cars on view ranging from the popular 6-h.p. two-seated to a handsome 24-h.p. brougham. Fig. 1 depicts a useful adaptation of the 6-h.p. vehicle for use as a light parcel delivery van or as a commercial traveller's car. A replica of the 28-36-h.p. Daimler car, which created a record by scoring the first five places in the Sunrising Hill climb held last summer by the Midland Automobile Club, is shown on the stand of Messrs. G. T. HEATH AND COMPANY. The car is fitted with a tonneau body of the Roi des Belges type. Messrs. HEATH also exhibit examples of the 8-h.p. and 15-h.p. Darracq cars, and a Corre 9-h.p. *chassis*.

The ROVER CYCLE COMPANY, LIMITED, furnish one of the chief features of the Show in their new 6-h.p. two-seated car. We give an illustration of the little vehicle, which has been introduced to meet the demand for an automobile at a popular price, in Fig. 2. In general arrangement it is a minature reproduction of the 8-h.p. Rover recently described in these columns. The motive power is supplied by a single-cylinder engine 95 mm. bore by 110 mm. stroke. The valves are mechanically operated and the mixture is furnished by one of the Rover automatic carburettors. A new design of cam shaft is employed, so arranged that it can be quickly detached. The car is gear driven, three speeds forward and a reverse being available. The wheel base of the new car is 6 ft. and the track 4 ft. The wheels are of the cycle type, 28 in. dia. and shod with 2 in. tyres. The

Fig. 1.—The Wolseley 6-h.p. Commercial Traveller's Car.

vehicle, which can attain a speed of twenty-four miles per hour, is attracting considerable attention and seems likely to become a popular type, particularly in view of its relatively low price.

One of the latest 12-h.p. Pipe cars is shown by the LONDON MOTOR GARAGE. The engine comprises four cylinders 80 mm. bore by 124 mm. stroke. The valves are all mechanically actuated by one camshaft. A special form of carburettor is employed to furnish the mixture, a jacket being fitted to it through which part of the hot water may be circulated. The transmission is by side chains, four speeds and a reverse being provided. NEWEY'S MIDLAND GARAGE makes a big display, the cars on view comprising the latest types of Napier, De Dion and Star vehicles. The BIRMINGHAM MOTOR-CAR COMPANY have on view examples of the 20-h.p. Hotchkiss and 10-12-h.p. Argyll cars, the new features of which we dealt with in our report of the Paris *Salon*.

Messrs. HORNER AND SONS exhibit for the first time a new type of American-built car known as the Queen. These are made in two sizes, 12-h.p. and 16-h.p. The horizontal engines have mechanically-operated valves. The cars appear to be well finished and are fitted with a detachable tonneau body. On the same stand is a Leda motor-launch with a 1½-h.p. motor. The boat will carry six people comfortably, and with this load can make about six knots. A range of tyres and motor-car accessories are also displayed. The Mobile cars are shown by the MOBILE MOTOR ENGINEERING COMPANY, LIMITED. The 6-h.p. and 8-h.p. types, which are fitted with De Dion motors, are now provided with armoured wood frames and wheel control. Three speeds forward and a reverse are available, the power being transmitted through a cardan shaft to a rear live axle. A handsome vehicle is the 24-30-h.p. Mobile with pressed steel frame and the latest type of Aster

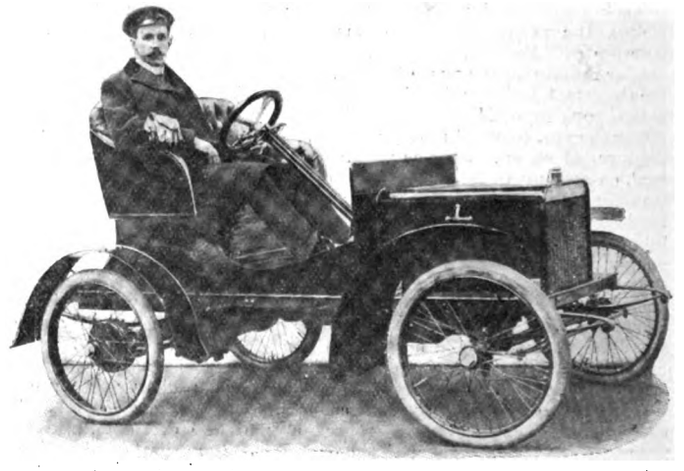

Fig. 2.—The Rover 6-h.p. Car.

engine; the car is chain driven and is provided with a well-appointed side entrance body. The BEAUFORT MOTOR COMPANY display a number of Beaufort cars, including a 15-19-h.p. Princess side-entrance double phaeton and a 12-18-h.p. double-cylinder petrol lorry. The LANCHESTER MOTOR COMPANY, LIMITED, are also present with several of their well-known cars.

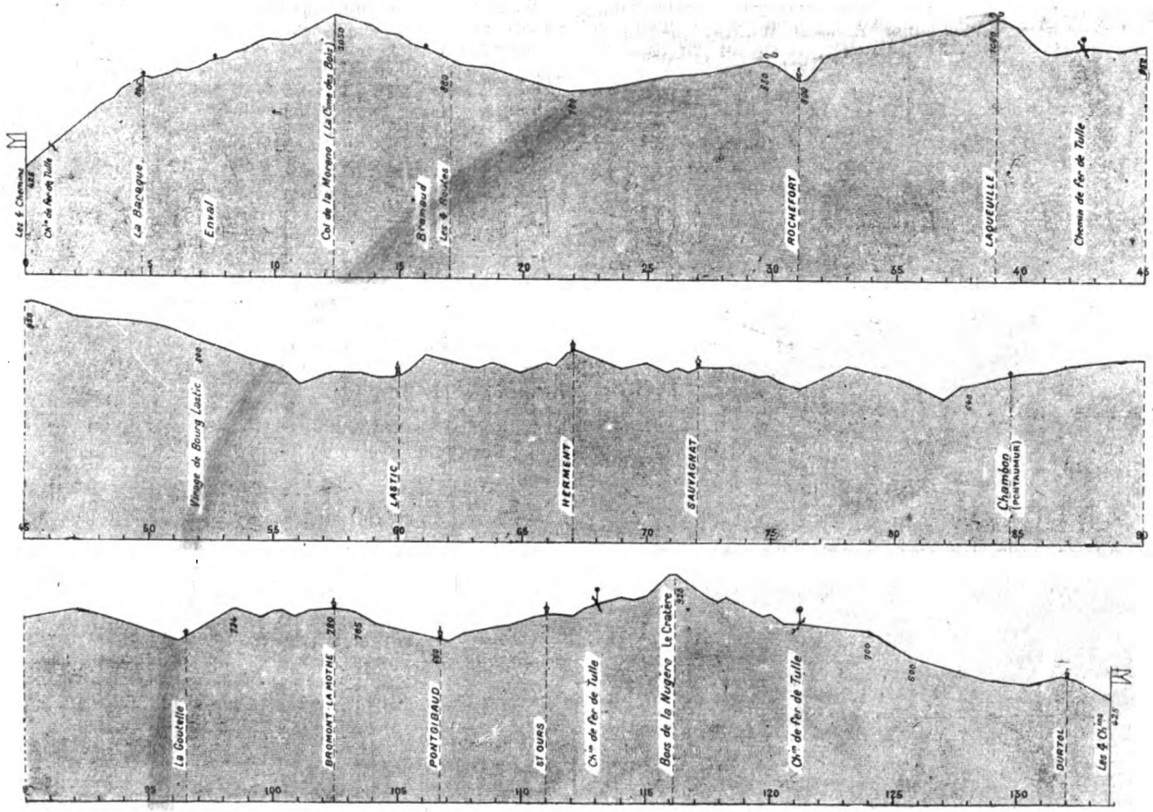
The BELSIZE MOTOR-CAR AND ENGINEERING COMPANY, LIMITED, show one of their 18-24-h.p. three-cylinder cars, the engine of which has mechanically-operated inlet valves and an automatic carburettor. Three speeds and a reverse with a direct drive on top speed are provided. A new model is found in a 12-h.p. double-cylinder Belsize car with central chain transmission. The engine, which has mechanically-actuated valves, is 4 in. diameter by 4½-stroke. The car is arranged as a two-seater, but an extra seat can be fitted at the rear when desired. Mr. MILBROWE SMITH shows a 16-20-h.p. car fitted with Aster engine. The vehicle has a pressed steel frame and is built throughout on modern standard lines. Messrs. ALLDAYS AND ONIONS exhibit a number of their motor-bicycles and a new 8-h.p. four-seated car, while the Martini cars are shown by Messrs. H. H. P. DEASY AND COMPANY, LIMITED.

A novel form of tri-car, known as the Priory Autette, is exhibited by the HAMILTON MOTOR COMPANY. The transmission is not by gears, belts, or chains, but by means of an infinitely variable gear obtained by a to and fro motion of a rod connecting the engine shaft with the lower extremity of an upright lever. The latter is pivoted at its centre. Able to slide from the upper extremity of the lever to the centre and below it is a bearing on which two rods are pivoted. These rods are directed to two ratchet wheels arranged as free wheels on the axle of the back wheel. The rods act on opposite sides of the circumference of the wheels, and are so arranged that one can pull the ratchet wheel from above and the other push it from below. By manipulating the slide above mentioned by means of a lever at the side of the driver the length of stroke of the two rods can be altered, and thus the length of push. There are other novel points about the machine, notably an ingenious method of steering and the way in which the machine is sprung.

A new firm in the heavy petrol wagon branch is Messrs. F. G. PICKERING AND CO., LTD., of Berwick-on-Tweed, who display a 20-24-h.p. vehicle designed to carry a load of two tons at a speed of twelve miles per hour.

In the heavy steam wagon section we noticed a seven-ton vehicle, shown by Messrs. FODENS, LTD., a four-ton wagon by the BRISTOL WAGON AND CARRIAGE WORKS CO., LTD., a five-ton lorry by the YORKSHIRE PATENT STEAM WAGON CO., LTD., and a five-ton tip wagon by Messrs. JAS. ROBERTSON AND CO. Messrs. JESSE ELLIS AND CO., LTD., also intended to show one of their four-ton wagons, but at the time we visited the Exhibition on Monday we learned that it had been delayed on the road owing to the heavy snow encountered on the way down from Maidstone. It was, however, only a few miles from Birmingham, and is doubtless by this time in position on its stand. Messrs. WALLIS AND STEEVENS, LTD., are present with one of their useful steam tractors, while Messrs. CLAYTON AND SHUTTLEWORTH, LTD., also show for the first time one of their new tractors.

Digitized by Google



Messrs. ALFRED DUNHILL, LTD., have as usual a large stand, on which is displayed a very complete selection of their "motoralities." The Haste water circulating pump, described in a recent issue of the *Journal*, is to be seen at the stand of the ASTON MOTOR ACCESSORIES COMPANY, where are also displayed the A.V. sparkling plugs and other ignition accessories.

The VACUUM OIL COMPANY, LIMITED, make a display of their well-known lubricating oils and greases. The "One Year" sparking plug, which we can recommend from practical experience, is to be seen at the stand of Messrs. LAMB BROTHERS and GARNETT.

A new speed and mileage indicator is shown by the SPEED AND MILEAGE RECORDER COMPANY. The BRITISH MOTOR FITTINGS COMPANY display a series of the J.A.P. cycle motors, ranging from 2¼-h.p. air cooled to 4½-h.p. water-cooled, as also the new two and three cylindor air-cooled engines. Other exhibits include the Prested batteries and patent accumulator charging board, the Watawata motor-cycle belt, and a comprehensive set of motor-car parts.

Challiner's mechanically-attached pneumatic tyre is shown by the SHREWSBURY AND CHALLINER TYRE COMPANY, who also exhibit a variety of rubber tyres, notably their "Twin Solid" type, which is being used on public service vehicles. Motor-car and cycle tyres are also exhibited by the BAVARIAN RUBBER AND ASBESTOS WORKS, the SELF-SEALING AIR CHAMBER COMPANY, LIMITED, and Messrs. DAVID MOSELEY AND SONS, LIMITED. THE SHAW MOTOR TYRE TREAD COMPANY are again making a feature of their non-skid bands, and also display their emergency garter for burst tyres. Non-skid devices are also shown by the WILTON COX DEVICE COMPANY, Messrs. DESILEE AND COMPANY, and Messrs. GROSE, LIMITED.

display a number of Ford cars. The Pivot cars, made in three sizes, 16-h.p., 24-h.p., and 30-h.p., are exhibited for the first time in this country by Mr. P. Cuthbertson. Messrs. Benz and Company have a range of the latest models of Benz cars. Of the Horbick cars, Messrs. Horsfall and Bickham stage examples of three and four cylinder cars. The Vinot cars, in 10-h.p., 14-h.p., and 20-h.p. *chassis*, are shown by Messrs. T. J. Harman and Company, and the popular Jackson dog-cart by Messrs. Reynold Jackson and Company. In addition to their well-known non-skid bands, the Otto Bennett Motor Company exhibit the Avon Tri-mobile. The British Automobile Commercial Syndicate have an extremely interesting range of cars on view, including the Spyker, Hotchkiss, Altona, Fiat, Mercedes and Bollée. Three sizes of the Brouhot cars and a side entrance Dechamps will be found at the stand of the Brouhot Motor Company. Mr. W. H. M. Burgess is displaying Clement-Talbot and Altona cars. In addition to examples of their 10-h.p., 10-12-h.p., 14-18-h.p. Hallamshire cars, Messrs. Durham, Churchill and Co have on view specimens of their change speed and steering gears, and also reversing gears for motor-boats. The Neue Automobil Gesellschaft exhibit an extensive range of the N.A.G. cars, which enjoy a high reputation in Germany. The cars on view range from 8-h.p. double-cylinder to 20-24-h.p. four-cylinder. The Star Engineering Company are present with examples of their 20-h.p., 10-h.p., and 7-h.p. cars, one of the latter being fitted with a detachable brougham top. Messrs. Hall and Co., in addition to a range of Darracq

The Gordon Bennett and Grand Prix Race. Profile of the Circuit d'Auvergne. [*La France Automobile.*

THE CRYSTAL PALACE AUTOMOBILE EXHIBITION.

THE first of the series of London automobile exhibitions, which opens at the Crystal Palace to-day (Friday), while not of large dimensions, will be found to be of a varied character. Altogether there are about eighty exhibitors, and among those displaying petrol cars are Messrs. Friswell, Limited, a range of Peugeot cars being shown on their stand. In the centre will be a landaulet, distinguishable this year from the fact that the steering column is taken through the dashboard. Two models of the popular Baby Peugeot are on view, No. 1 having a sloping bonnet and ordinary open seats, and No. 2 a honeycomb radiator, square bonnet and bucket seats. A comparatively new model is the 7-9-h.p. Peugeot, which has a two-cylinder engine fitted with magneto ignition and wheel control. Examples of the 12-16-h.p. side entrance Peugeot, the 10-12-h.p. four-cylinder car, and of the latest 28-32-h.p. type are also to be seen.

Another large stand is that of Clement-Talbot, Ltd., on which cars extending from 7 to 50-h.p. are shown. The Central Motor-car Agency cars of the 1905 type, exhibit a novelty in the 5-h.p. "Lilliput" car with friction drive, which has been introduced to meet the demand for a two-seated vehicle at a popular price.

Electrical vehicles are displayed by the Krieger Electric Carriage Syndicate and the Scheele Electric Carriage Company. Heavy steam vehicles are shown by Messrs. Jesse Ellis and Company and the Thames Engineering Company. The latter, which is a new comer in this branch of motor engineering, in addition to a four-ton steam lorry, is exhibiting a 20-cwt. petrol van. Messrs. Wallis and Steevens exhibit one of their miniature traction engines. Probably the largest stand in the show is that of Messrs. Dunhill. Ltd., whose exhibit comprises "everything but the motor.' Messrs. Geo. Polkey, Ltd., exhibit the Sampson acetylene head-light reference to which is made in another part of the present issue, and are inviting suggestions as to the best methods of conducting a trial of motor head-lights, a matter in which they are greatly interested. Messrs. G. T. Riches and Co. display the latest form of the Eisemann high-tension magneto ignition and other electrical accessories. Amongst the other exhibitors are Messrs. Adams and Co, (jacks), the Anglo-American Oil Co., Aquascutum, Ltd. (motor clothing), Messrs. Botiaux (carriage work), Messrs. Beardmore and Co. (motor-car frames), Chloride Electrical Storage Co., Ltd. (accumulators), Continental Caoutchouc and Guttapercha Co., Mr. C. H. Edenborough (oils), Messrs. Burberry (motor clothing), General Accident Assurance Corporation, Ltd., Messrs. Glaskin and Co., Messrs. Green and Son (motor lawn-mowers), the Gratze Patents and Engineering

Digitized by Google

Syndicate, Ltd. (speed indicators), the Horley Motor Co., Messrs. King and Co. (motor-boats), Messrs. Longstreths, Ltd. (accumulators), the Motor Patent Appliances Co. (motor-car whistles), the Market Harborough Rubber Co., Patcho Ltd., Messrs. S. Smith and Sons (motor clocks and speed indicators), Messrs. Sawyer and Co. (non-skid bands), Union Accident Insurance Co., Messrs. Lacoste and Co. (ignition apparatus), Messrs. Kuettner and McDonell (accumulators), Messrs. Leonard and Co. (motor-cycles and the Leonard car), Messrs. D. Moseley and Sons, Ltd. (tyres), the New Kyma Car Co., the North British Rubber Co., Price's Patent Candle Co., Ltd., Messrs. Statter and Co. (jacks, lamps, etc.), the Samson Leader Treads and Tyre Co., Ltd., Stern-Sonneborn Oil Co. (oils), Messrs. Vandervell and Co. (accumulators), and Messrs. Willcox and Co. (oils and general motor-car accessories).

In connection with the Exhibition, which closes on February 4th, a series of competitions is being organised, relating respectively to accessories for cars and for motorists, and non-slipping contrivances.

CLUBS AND ASSOCIATIONS.

NORTHAMPTONSHIRE A.C.

THE first annual dinner in connection with this club was held at headquarters, the Great Northern Hotel, Peterborough, on Thursday of last week. Councillor Richard Winfrey presided, and amongst those present were:—Mr. F. W. Southwell (who occupied the vice-chair), Mr. A. Noel Mobbs (secretary of the newly-established automobile

Motorist to Tramp (who has been knocked down): "While down there you might just see if the tyre is all right!"

club at Northampton), Mr. T. Cooke (Yaxley), Mr. T. W. Mays, J.P. (Bourne), Mr. A. Adams, Mr. R. Julyan, Mr. H. Ruff, Mr. J. Rowe, Mr. F. S. Southwell, Mr. R. Parris, Mr. C. Godfrey, Mr. W. Walshaw' Mr. F. Caster, Mr. F. J. Redhead, Mr. R. G. Gentry, Mr. C. Guest, Mr. F. C. Colls, Mr. J. Montgomery, Mr. F. Heighton (of the Peterborough and District M.C.), Mr. E. H. M. Wood (secretary and treasurer) Mr. J. E. Plummer, Mr. R. Woodman, Mr. F. Clarkson, and Mr. F. W. Morris.

After the loyal toasts had been duly honoured Mr. A. Noel Mobbs proposed the toast of "The Club." He expressed the thanks of the Northampton automobilists that they (the local club) had consented to change their name to the Peterborough and Counties A.C., in order that their old appellation, "The Northamptonshire Club," might be adopted by the county town. He hoped that the two clubs might have some joint runs next season, so that their members might become acquainted with one another, and possibly they might organise a hill-climbing competition or something of that sort. If they could arrange a competition or a gymkhana he should be pleased to do all he could to make it a success. Mr. E. H. M. Wood (the energetic secretary) responded. He mentioned that they had had a fairly successful first year. The club commenced in good earnest, and then for a time things went a bit slack. However, they soon got some fresh works in the form of an Executive or Winter Programme Committee, and since then they had done extremely well. After acknowledging the assistance of several individual members, Mr. Wood mentioned that they hoped shortly to amalgamate with the Peterborough and District Motor Club. He had received a communication from Mr. Heighton saying that their club had consented to the union. In the future, therefore, he had every reason to believe that theirs would be a big organization. He hoped the club might be able to start the season with a speed trial in Milton Park in the morning, a hill-climbing competition at Caistor in the afternoon, and possibly a dinner in the evening. That should give the club a very good send-off. Mr. J. Montgomery gave "The Visitors." He said that motorists seemed to be buffeted about by hostile J.P.'s and "horsey" gentlemen, but if they united they would be a power in the land. If they showed gentlemanly conduct on the road the prevalent prejudices would soon wear down. He would like to have seen the bishop, who had lately joined the ranks of automobilism, present, but he was pleased to notice his Lordship's driver, Mr. Plummer, amongst them. The latter humorously replied. Other toasts followed, and an excellent programme of music and singing was rendered in the course of the evening.

HEREFORDSHIRE.

THE annual general meeting of the Herefordshire Automobile Club was held at the Mitre Hotel, Hereford, last week, when Mr. J. T. Hereford presided. The hon. secretary and treasurer, Mr. Wilfred Groom, in submitting his report and statement of accounts, said he thought the club ought to congratulate itself on the fact that it had a balance at all in hand considering the large demands made upon its funds. He pointed out that they had relieved the A.C.G.B.I. of nearly £100 in expenses in connection with the recent small car trials. This was a large amount for a new and small club to find, the half of whose receipts were paid away in fees to the A.C.G.B.I. for affiliation. However, there was a balance in the bank of £2 9s., and he saw no reason why there should not be a handsome balance to their credit at the end of 1905, as they would not have the expenses of forming the club again, nor would they have to work fifteen months instead of twelve on one subscription.

The following officers were elected:—Col. E. S. Lucas Scudamore, president, Col. Hopton, Rev. H. G. Morgan, Messrs. J. T. Hereford and H. Graystone, vice-presidents. Capt. Inglefield, Messrs. E. W. Chave, J. Fryer, J. H. Hall, E. C. Woollard, A. W. Marriott, Q. Miller, A. Townsend, J. C. Vaughan, J. Parker and E. W. Langford, committee, and Mr. Wilfrid Groom, hon. sec. and treasurer.

It was decided to approach the County Council over the Universal Lighting question, and the hon. sec. was requested to ascertain the views of other provincial clubs on the matter.

A vote of thanks was passed to Mr. J. T. Hereford for his services during the past year as president, and to Mr. Groom as hon. sec.

SHEFFIELD.

THE committee of the Sheffield Club will have a very satisfactory report to present to the members at the annual meeting to be held on Monday next at the King's Head Hotel, Sheffield. The balance at the bank is £78, and during 1905 it is proposed to have a short-distance speed contest, if a suitable private road can be obtained, a gymkhana, the annual hill-climbing competition, in addition to lectures, the monthly club meets, and other events. A strong sub-committee is at present revising the rules under which the various club trials are held.

AN "ADVANTAGE" AND A "SOURCE OF DANGER."

AT the Marylebone County Court, last week, before Judge Stonor, Mr. Thomas McKenna, 31, Basinghall Street, E.C., sought to recover £3 12s. from Mr. Alfred Henry Waters, 9a, Harrow Street, Marylebone, W. The claim was in respect of damage to a motor-car, alleged to have been caused through the negligence of one of defendant's cabmen. The plaintiff stated that, driving his motor-car slowly along the Marylebone Road one morning, he had to stop rather sharply, because a 'bus immediately in front did so. Half a second later a shaft of a four-wheeler, driven by one of defendant's men, smashed into the back of the motor-car.

In cross-examination, the plaintiff said that he had had considerable experience in driving motor-cars. The defendant's driver in question said that the motor-car "must have backed into the shaft."

His Honour remarked that the ability to stop motor-cars dead almost instantly was often an advantage; but it was easy to see that it might prove a source of danger; for, of course, a horse could not be stopped in the same way. A London cabman, however, should by this time know something of the peculiarities of motor-cars; and, as regarded the present case, his Honour thought that the cabman was to blame in getting so close behind the motor-car. Judgment for the plaintiff, with costs.

CELEBRITIES of the motoring world, including the King, the Duke of Connaught, and Mr. A. J. Balfour, are included in a new series of picture postcards brought out by Messrs. Raphael Tuck and Sons, Limited. They are produced by the firm's well known oilette process.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, FEBRUARY 4, 1905. [No. 309.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE suburbs of London will soon prove to be a network of motor-'buses, and at Upper Norwood an agitation is being organised urging that a motor-'bus service may be instituted there in place of the tram-lines, which one section of the community is advocating. Another suggestion for the development of public-service vehicles in South London is that the Brighton Railway Company should run two or three motor-'buses in connection with some of their stations in the southern suburbs. At Croydon, where the tramcars have established a monopoly of the High Street, suggestions for motor-'buses are also becoming rife. After five weeks' successful running of the Orion motor-'bus upon the actual work required of it by the London General Omnibus Company, Messrs. Moss and Woodd stopped the 'bus and had the machine to pieces for the inspection of the company's engineers, who found no appreciable wear or strain on any of the parts. This week Messrs. Moss and Woodd have received an order from the London General Omnibus Company for a large number of vehicles.

◆ ◆ ◆

Inland Revenue.

THE Inland Revenue authorities, on the declaration form for motor licences, point out that "when, by reason of a change in the character of a motor, an additional licence is duly taken out upon payment of a full year's duty, the duty paid on the motor previously kept will be repaid by the Collector of Inland Revenue." We take this to mean that where a motor-cyclist who has paid 15s. for a licence for a motor-bicycle decides in the same year to go in for a car, he will have to take out a new licence for £2 2s., but will have the 15s. previously paid refunded to him. Perhaps some of our readers who have been thus situated will let us have their experiences.

◆ ◆ ◆

The Automobile Mutal Protection Association.

A MEETING of the Council of the Automobile Mutual Protection Association took place on Thursday of last week at the registered offices of the society, Cecil Chambers East, Strand, W.C., when the chair was occupied by the President, the Earl of Shrewsbury and Talbot. There were also present:—Messrs. Charles Cordingley, Henry Spurrier, jun. (the Lancashire Steam Motor Co. Leyland), W. E. Rowcliffe (the Hercules Motor Wagon Co., Manchester), W. Lecoq le Bride (the Roadway Autocar Co.), A. Pereno (the Farman Automobile Co.), Walter H. Maudslay (the Maudslay Motor Co., Coventry), J. Donovan (the Londonderry Steam Wagon Co.), F. P. S. Harris (the General Petroleum Co.), Lt.-Col. Elton-Burroughs (Messrs. Hewetson's), and Albert Brown (Messrs. Brown Bros.). It was reported by the secretary, Mr. E. Shrapnell Smith, that the Automobile Club of Great Britain and Ireland had rejected the proposal of the Society of Motor Manufacturers and Traders, that the Heavy Motor Trials should be held in April, and that the recommendation of the Mechanical Transport Committee of the Automobile Mutual Protection Association, that the trials should take place early in September, had been agreed to by the Club. Various matters of procedure in conjunction with the forthcoming Royal Agricultural Hall Motor Car Show, from March 18th to 25th, which is under the patronage of the Association, were discussed, and it was formally reported that the commercial vehicle section of this Exhibition would receive the official support of The Motor Van and Wagon Users' Association, which body had also appointed a jury of experts to make awards for novel features in design. The fourth annual general meeting of the Association was fixed to be held during the same show. The following firms, being Nos. 182 to 191 on the register, were admitted members of the association:—Messrs. H. E. Hall and Co. (Tonbridge), the Cowey Engineering Company, Limited (Kew Gardens), Messrs. Lewis (Liverpool, Birmingham and Manchester), Messrs. Dean and Burden Bros., Limited (Salisbury), the Shrewsbury and Challiner Tyre Company, Limited (Manchester), Messrs. Scammell and Nephew (Spitalfields), Messrs. John Stewart and Son, Limited (Poplar), Messrs. H. M. Hobson, Limited (Chelsea), Messrs. Jacobs and Barringer (London), and the Glasgow Motor Lorry Company, Limited (Glasgow). Meetings of the Finance and Mechanical Transport Committees were also held, the latter under the chairmanship of Mr. Walter H. Maudslay, of Coventry.

◆ ◆ ◆

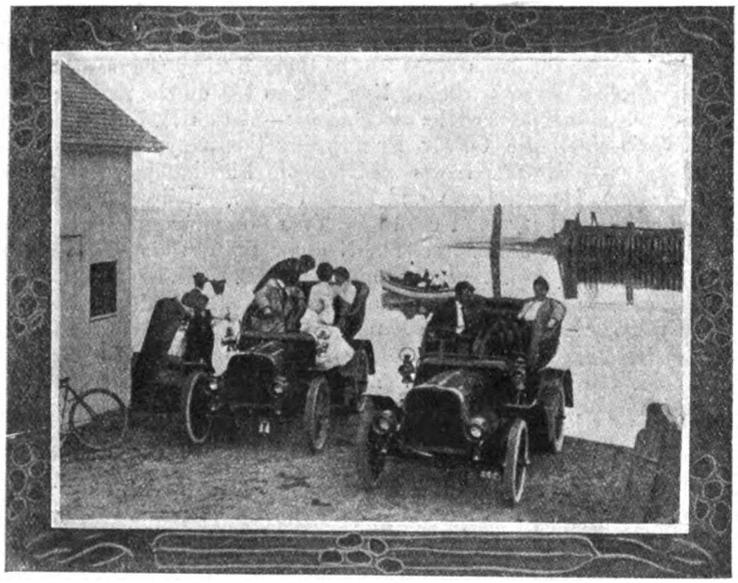
Non-Skidding Bands.

EVEN when the tyres of the rear wheels of a motor-car are fitted with non-skid bands, it is necessary to drive with care on greasy roads, especially on turning cars. In the course of a conversation with a well-known member of the Automobile Club the other day, he told us how on turning a corner the front wheels of his car skidded into the kerb, breaking one of the wheels. What had happened, so far as he could gather, was that he had taken the corner a little quicker than he should, and a skidding tendency being present which the non-skids on the rear wheels would not allow to have effect, the motorists' bugbear transferred its attentions to the front wheels, with the result mentioned. The sensation was, so he informs us, a strange one—just as if the steering gear of the car had become inoperative. The moral of the story is that, notwithstanding non-skids are fitted, greasy corners must be negotiated slowly and with care.

◆ ◆ ◆

Honours for Motorists.

HONOURS in the peerage are being bestowed on two distinguished motorists who have won fame in the legal world. Sir Francis Jeune, the retiring President of the Divorce Court, was one of the first to associate himself with the automobile movement, and his speech at one of the earlier Agricultural Hall exhibitions first drew attention to the valuable assistance the motor-car would render country gentry in extending their social radius in the country. Mr. Graham Murray, M.P., who is to be the Lord Justice-General and Lord President of the Court of Session in Scotland, is also a motorist, and has



Digitized by Google

lately used his great influence north of the Tweed to make easier the path of the motorist. We congratulate both gentlemen on the honours they have received, and would also offer felicitations to the automobile movement on thus extending its influence among the greatest in the land.

◆ ◆ ◆

Motoring in Sussex.

EVERYTHING points to a lively season for the motorists of Sussex, who successfully inaugurated their Automobile Club on Saturday—as is recorded on another page — when committee and officers were elected, and some useful work was done. The idea is that, while Brighton will be the headquarters of the county organisation, sub-centres will be formed throughout Sussex, which will actively concern themselves with local movements likely to adversely affect the rights of motorists. A resolution was adopted against the proposal to close Middle Street, Horsham, to motorists, and altogether the largely-attended meeting demonstrated the enthusiasm with which the Sussex friends of automobilism are taking up the question. In this connection mention may also be made of the speed trials which it is proposed to hold at Brighton in the third week of July. Permission for the races to be run on the Madeira Terrace is being recommended to the Town Council by the General Purposes Committee, and from the list of the local committee that has been formed it is evident that a strong effort will be made to attract motorists as well as the general public.

◆ ◆ ◆

Dover not to be Scheduled.

AT length the Local Government Board seems to be making up its mind with regard to the inquiries which its inspectors have lately held under the Motor Car Act. An announcement has just been made that it cannot accede to the request of the Dover Corporation to schedule Dover as an area, under the Act, in which motor-cars shall not be driven at more than eight miles an hour. The Board state that, since the local inquiry held at Dover, several similar inquiries have been held at other places, with the result that they feel they would not be justified in framing such orders for considerable areas. Upon this decision Earl Russell, and the other members of the A.C.G.B.I. who have taken a leading part in the various local inquiries, are to be congratulated.

Dust in the North.

ELSEWHERE we give a report of the annual meeting of the Manchester Automobile Club—a flourishing institution with nearly 200 members. During the past year the committee of the club, recognising the important bearing that the dust nuisance has on automobilism, tried experiments in conjunction with the local councils, in treating 1½ miles of road in Cheadle and 220 yards in Withington with Westrumite. A donation of £5 was also given towards similarly treating the road by St. Margaret's Church, Bowdon, and a donation of two guineas towards the fund for dealing in the same way with 1½ miles of Brooklands and Hale Road. The Committee consider that the results were sufficiently encouraging to warrant local authorities in suburban districts of the north in experimenting further, and we trust that the incentive thus given will have a good effect in Lancashire.

◆ ◆ ◆

Uniform Speed Limits Wanted.

MR. W. T. COCKBURN, the chairman of the Kingston bench of magistrates, in fining a motorist who had contravened the regulations in Richmond Park—regulations the legality of which has been called into question in another court—agreed that with the different rates of speed allowed by the law a driver was apt to forget at what speed he was allowed to travel. On the ordinary road the legal limit is twenty miles an hour; in the Royal parks the apparently illegal limit is but ten miles an hour. In the case in question the defendant had not, according to the trap and stop watch, travelled more than nineteen miles per hour. But sympathy was all he could get from the Bench. Still the expression against the want of uniformity that some authorities would like to establish should be useful to the motorists who are considering how best to amend the present Act when attempts are made to re-impose it in its present form.

◆ ◆ ◆

Richmond Park as a Trial Ground.

SEVERAL correspondents have called our attention to the suggestion that Richmond Park should be utilised for testing cars, a proposal that is likely to encounter much opposition from residents of the district, who regard the Park as their own domain. The Test Hill is, of course, already fairly well used by motor-cars, and considerable tolerance has been shown by the authorities, but the idea of making it a recognised place of resort for trial purposes will be resented by motorists who pass that way as a matter of ordinary convenience, for the immediate effect would be to displace them from the favourable regard of the keepers and frequenters of the Park. There will also follow the prohibition of motor-cars altogether, or else the restriction of automobiles to minor roads along which they now scarcely ever travel.

◆ ◆ ◆

Horse v. Motor-Car.

AN interesting comparison between the relative cost of the horse and the motor-car is afforded by an experience of the London County Council. For the visits paid by the chief officer of the Parks Department and the inspectional staff to the parks and open spaces a horse and phaeton are employed. It is found that to hire a horse from a jobmaster costs £90 a year. Quotations have been obtained recently for the hire of two motor-cars for the use of committees and heads of departments. The estimates sent in varied from £11 to 18 gs. a week for each car, and the offer which is likely to find acceptance is based on a charge of £15 8s. per week for each car—a substantial saving, which should be made widely known for the benefit of the automobile industry as well as the possible relief of patient and

Digitized by Google

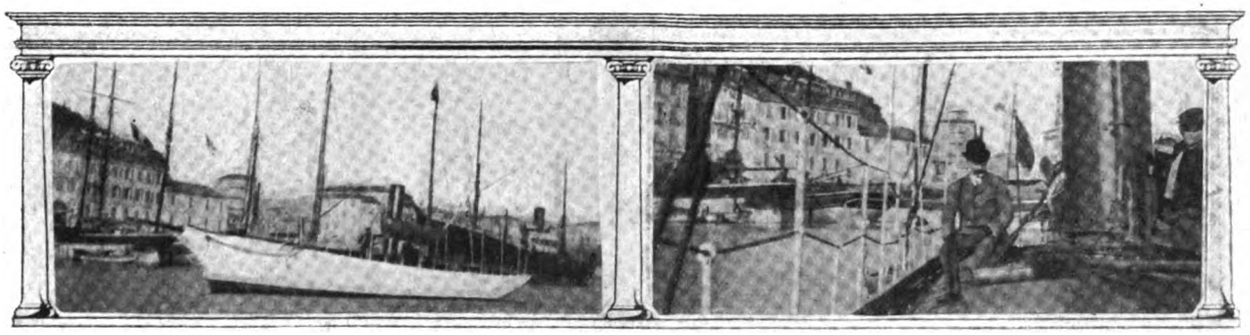
long-suffering ratepayers. Mr. Blandy Jenkins has reported to the Roads and Bridges Committee of Glamorgan County Council at Cardiff, that the sub-committee appointed to deal with the question of obtaining a motor-car for the use of the county surveyor had had an expert's opinion, and recommended the purchase of a car at a cost not exceeding £475. It was unanimously agreed to recommend the County Council to adopt the sub-committee's suggestion. Another municipal testimony to the economy of the motor-car!

◆ ◆ ◆

Technical Instruction.

It is gratifying to notice the increase of interest in automobile technical instruction in the provinces. Reference has previously been made in these columns to the enterprise of Messrs. Crosfield and Son in inaugurating such classes at Warrington, and now we learn that the other day a large party of students from the Handsworth Technical School visited the works of the Wolseley Tool and Motor Car Co., where considerable interest was evidenced in the motor-car department. As a possible preliminary step towards the establishment of technical classes in motor-car work at some of the technical institutes in the Midlands, this is to be welcomed. Motor work is a department of engineering study to which greater attention will have to be given, and we would again emphasise the fact that the official classes at all these establishments should be conducted by practical men who are fully acquainted with the details of the modern car as well as with the general principles of engineering work.

◆ ◆ ◆



The Monaco Motor-boat Races.

We have received from Mr. Harrington Moore preliminary notice of his projected party for the Monaco motor-boat races, from April 6th to 17th next. This event seems destined to attract world-wide interest, and, judging from the number, power, and speed of the competitors of all nations, will doubtless afford something sensational in the way of speed racing at sea to those who are fortunate enough to witness the contests. Mr. Harrington Moore, who has had no little experience in organising similar projects, has anticipated the probable wish of many automobilists to take advantage of this unique occasion of visiting for the first time the matchless beauties of the Riviera or of renewing their acquaintance with them and at the same time assisting at the motor-boat race meeting. Mr. Moore has chartered the clipper steam yacht "Bohemien," depicted above, to follow all the races, and, recognising the advantage of numbers, has completed arrangements by which a party of not less than thirty can travel by special first-class train from London to Monte Carlo, returning independently at any time within the month at option, and then obtain hotel and board for a week and the use of the yacht for the moderate inclusive payment of not more than £20—perhaps less, according to number. Already Mr. Moore has been promised half the minimum number, and he asks that those who expect to be able to join his party should, without pledging themselves, write him to 18, Adam Street, Adelphi, W.C., for the programme of the tour. We may add that Mr. Harrington Moore has very sensibly decided to welcome ladies, who are accompanied by relatives, to take part in the expedition.

◆ ◆ ◆

Objections to Universal Lighting.

The movement that has lately been developing in favour of the universal lighting of vehicles, and for all who drive cattle on the highways at night time to carry warning lights, has been met by the members of the Teviot Farmers' Club in a spirit of opposition. The Secretary, at a meeting held recently, reported the receipt of a communication on the subject from the Scottish Chamber of Agriculture, and considerable feeling was evinced by the suggestion of the Scottish Automobile Club to the effect that persons in charge of cattle or sheep on highways should carry a lighted lamp after dark. It was urged that this would be an intolerable nuisance to agriculturists, and whilst little heed was taken of the suggestion so far as it applies to vehicles, it was evident that its application to drovers and others would meet with considerable antipathy from the Scottish farmers. Ultimately it was agreed to give support to the proposal for the reasonable lighting of vehicles, but to oppose any suggestion for men to carry lights when driving sheep or cattle.

The Steam Yacht "Bohemien." Mr. Harrington Moore, the Organiser of the Projected Trip.

THE MOTOR BOAT RACE AT MONTE CARLO.

◆ ◆ ◆

A Large Tyre.

Most of the trouble experienced with pneumatic tyres is owing to the fact that the driving wheels are fitted with tyres of too small a diameter for the weight to be carried. Many instances might be given of users of cars who have been endeavouring to obtain satisfaction from the use of 90 mm. tyres on all four wheels, although the weight of the car unladen has been as heavy as 28 cwts. The more common use of the 120 mm. and 125 mm. tyres on the rear wheels has given a much greater degree of satisfaction, but even now with the 120 mm. and 125 mm. tyres many cars fitted with heavy luxurious bodies, with brougham and limousine tops, and with seating capacity for six or eight persons, are shod with tyres of too small a size. If every owner of a car would understand that by the fitting of efficient and large size tyres half his troubles would be obviated, and that the tyres themselves would stand better and last longer, we should see many more cars shod with tyres of a proper diameter necessary to carry the weight. Bearing this point in mind, the Continental Caoutchouc and Gutta Percha Co. have this year brought out a new model tyre, 935 by 135 mm. (5½ in.), of which they are making a speciality. It will cost a little more than the 120 mm. and 125 mm. tyres, but at the same time they believe that they will give absolute satisfaction

Digitized by Google

to those owners of high-powered heavy vehicles, which it has been impossible for them to obtain in the use of small-sized tyres. Exhaustive road tests have been carried out in order to produce a tyre which is strong enough for the work it has to undertake. The extra size does not make the tyre appear ungainly, but, on the contrary, the larger size is hardly noticeable. This new tyre is made with the company's well-known square ribbed tread.

◆ ◆ ◆

Refreshments when Travelling.

At a meeting of licensed victuallers and others at Ipswich, Mr. H. C. Westgate has been reading a paper with reference to the supply of refreshments as affected by the Licensing Act which has just come into operation. The obligation to supply refreshments was not by any means a new provision. Under the old law all innkeepers were already under this obligation, and objections had in a few instances been made against the renewal of licences upon that very ground, though comparatively few seemed aware of its existence. The fact of the clause making it compulsory to supply suitable refreshment being inserted in the present Act would necessarily draw public attention to it, and it might certainly be taken as an intimation that all on-licence holders must be prepared to meet the reasonable requirements of the public in this respect. Of this he felt convinced, that by cheerfully accepting the situation they would find a fresh source of profit, and might attract to their houses some who had been led to regard them and their calling in a somewhat unfavourable light. Motorists are naturally interested in the greater stringency of the law in this respect.

◆ ◆ ◆

Motor Traction in Ireland.

The much-vaunted Iveagh-Pirrie scheme of motor transport for Ireland seems scarcely likely to fructify, and the delay that has taken place in its realisation has disappointed those who ardently hoped the prosperity of Ireland might be restored by means of the automobile. But here and there local enterprise is seeking to supply the needs of the agricultural community. The farmers of North Wexford recently met and discussed a scheme of motor transit for the districts of Enniscorthy, Orlart, Kilmuckridge and Gorey. A committee was formed, to which representatives of the local banks have also been elected, which will further consider the matter, and those who wish well to the district are hopeful of the early adoption of a system of motor transport in the locality.

◆ ◆ ◆

A Blameless Motorist.

With the fairly familiar heading, "Killed by a Motor-car," the daily papers have been chronicling the death of an old Thames ferryman who stepped off the pavement into the roadway at Surbiton in front of a motor-car, and when its horn sounded hesitated and got confused as to the way to go. The car slowed up, but the man was knocked down and died from the result of injuries received. At the inquest a verdict of "Accidental death" was returned, the jury exonerating the driver of the automobile from all blame. Had a horse-drawn carriage caused the sad mishap the event would have been chronicled in a short paragraph, but because a motor-car was involved—although held to be blameless so far as the accident was concerned—the sensational heading was published far and wide. Fortunately, however, some members of the general Press are beginning to recognise that the motor-vehicle is not necessarily an instrument of murder.

◆ ◆ ◆

London and Motor Traffic.

The paper read before the A.C.G.B.I. last week by Mr. J. Swinburne was a delightful essay, full of quaint sayings and happy references, but contributing little in the way of solid facts and arguments to the solution of the difficulties of traffic in London. He spoke of the use of the motor-car for bringing business men from the country and back every day; and of the automobile as a means of transport in town. On the first point reference was made to railway communication as being a drawback to the full development of the motor-car in that connection. A humorous classification of sport followed, and the difficulties of housing the car, should the owner come to town on it every day from the country, were mentioned. Mr. Swinburne, however, was good enough to say that the motor-omnibus seems to have come to stay, and that it would be followed by the motor-cab in a very short time—in fact, we hear of a company with a capital of £150,000, now in course of formation, to develop the motor-cab in London. The whole matter was summed up in the sentence with which the author concluded the paper, declaring that "the question of tyres wearing out owing to unsuitable roads is, I take it, the chief flaw in your happiness." Discussion was subsequently indulged in by Earl Russell, Colonel Crompton (who presided), Mr. Roger Wallace, K.C., Mr. E. Shrapnell Smith, Mr. F. Coleman, Mr. Roger Wallace, Mr. Fairbank, and Mr. O. Thompson.

The Duke of Connaught on a Motor Car at the Military Manoeuvres in Algeria.

The report of the directors of the Car and General Insurance Corporation, Limited, for the year ended November 30th, 1904, states that in the first year a gross premium income of £30,445 was secured, and, after deducting reinsurance premiums, a net premium income of £26,828; there were appointed 1,443 representatives of the corporation throughout the United Kingdom; and branch offices were opened in Birmingham, Cardiff, Dublin, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, Newcastle, and Southampton. The claims paid amount to £4,225. The net result of the year's working is a balance of £1,875, against which the directors propose to charge the whole of the promotion expenses, amounting to £1,751, and to carry forward a balance of £123.

The "Brotherhood" Car.

IT is now more than a year since the announcement was made of the formation of the Brotherhood-Crocker Motors, Limited, to introduce a new type of petrol-car on the market. Although very little has been heard of the company in the interim, it has been quietly at work, and the result of its labours is to be seen in the batch of "Brotherhood" cars now coming through, and of which we are able this week to commence a description. As the car comprises a number of special features needing separate explanation, it may be well if we briefly outline the general arrangement which has been adopted ere passing to the detailed description. In the first place, it may be mentioned that the vehicle, which is throughout of British design and manufacture, has been constructed under the personal supervision of Mr. Percy Richardson, the general manager of the company, who, as is well known, has been connected with the automobile industry since its inception in this country. If proof were needed of the high-class workmanship embodied in the construction, it is only necessary to mention that the engines, gear-boxes, commutator gear, etc., are manufactured by the old-established engineering firm of Mr. Peter Brotherhood, Westminster Bridge, which has now enjoyed, for a considerable number of years, an unrivalled reputation for high-speed engines and fine engineering work.

G Governor automatically controlling ignition.
H Removable cap to adjust ignition governor spring.

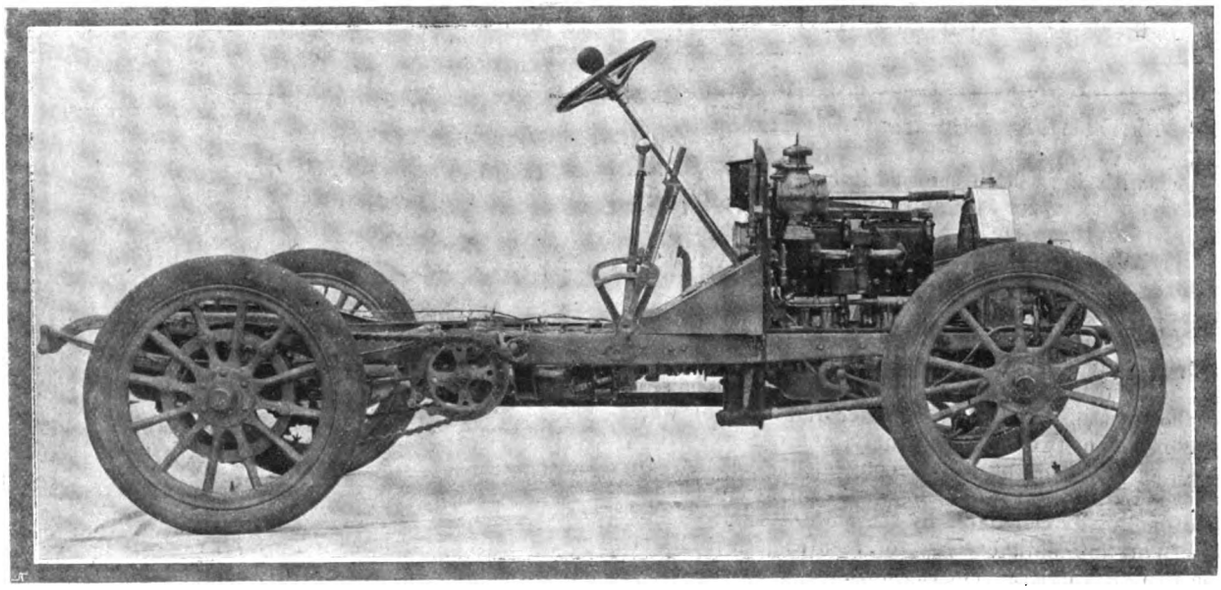

Fig. 3.—Side View of Chassis of the "Brotherhood" 20-h.p. Car.

The general design and construction of the car has been carried out on the most modern and accepted lines, the engine being carried in the fore part of a pressed steel frame, the power being transmitted through a clutch to a gear-box and through bevel gear to a differential shaft, which in turn is connected by

Digitized by Google

side chains to the rear road wheels. The object of the designers has been to turn out a car which will prove reliable, economical and efficient in its operation, whether in the hands of an experienced or an inexperienced driver. The result is that simplicity of construction and control, and accessibility and ease of detachment of parts, with increased convenience for making adjustments in a simple manner, are the key notes throughout the whole design. As will be noticed by the side view of the *chassis* (Fig. 3) the frame has been kept low, facilitating mounting and dismounting to and from the car, assuring steady running by keeping the centre of gravity near to the ground, and safety in rounding corners; whilst ample clearance has been allowed under the point nearest to the ground, obviating the risk of striking gate stops or other road obstructions of exceptional height.

As far as possible all the parts are made and fitted independently of each other, so that they can be removed without also having to detach other parts or affect adjustment of the same, this facility being particularly noticeable as regards the brakes. Another point to which attention may be drawn is that all parts are stamped with a number, which has only to be quoted when a replacement or duplicate of the part is required. Another striking feature of the vehicle is the reduction in the number of levers, etc., for the control of the engine and car; altogether there are only five, these being composed of (1) the

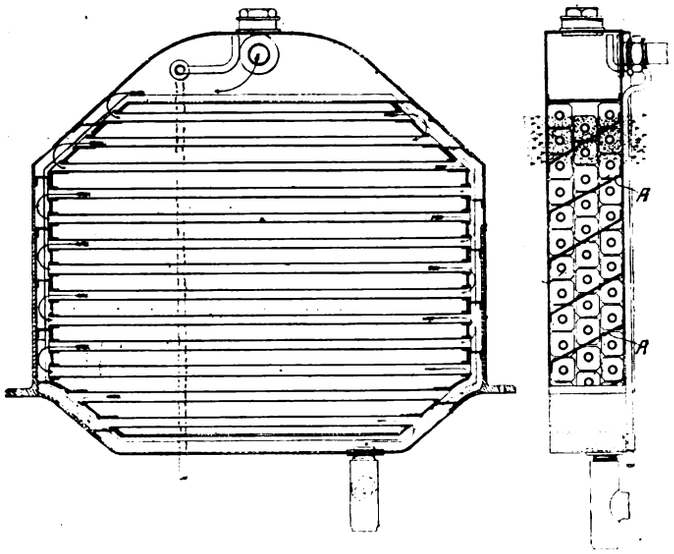

Fig. 4.—Front and Side Part Sectional Elevations of Radiator.

steering wheel with horn bulb screwed in centre; (2) a single change-speed lever for all forward and reverse speeds; (3) one foot lever only for throwing out the clutch and applying the foot brake; (4) a hand lever for the rear brakes; and (5) one pedal only for varying the speed of the motor, so arranged that the finest possible graduation of engine speed can be obtained, or the same can be entirely shut off and used as a brake without tiring the foot in any way, or being affected by undue pressure of the foot when driving over rough roads. As will be seen from the above, the whole car is under full control when travelling by means of two foot levers only, and can be started, speed varied, or stopped, by these convenient means. No ignition lever is required, as the timing of the spark is mechanically and automatically controlled by the motor itself, and this, combined with an automatic carburettor, assures perfect adjustment of the two vital functions of the working of the engine, so that the same will always automatically give the most efficient results.

The frame is of pressed steel construction, narrowed in front to give a large lock to the front wheels and slightly raised at the rear to allow of the employment of a straight back axle, and also add to the appearance of the vehicle. As will be seen from Fig. 3 the frame is built low, yet the parts are so arranged as to be accessible and also to give plenty of clearance, the lower part of the mechanism being 10½ in. from the ground. The engine comprises four cylinders, each 4 in. diameter by 5 in. bore; they are cast in pairs with large water jackets extending round the valve chambers as well as the cylinders, provision being made in the jackets for the thorough circulation of the

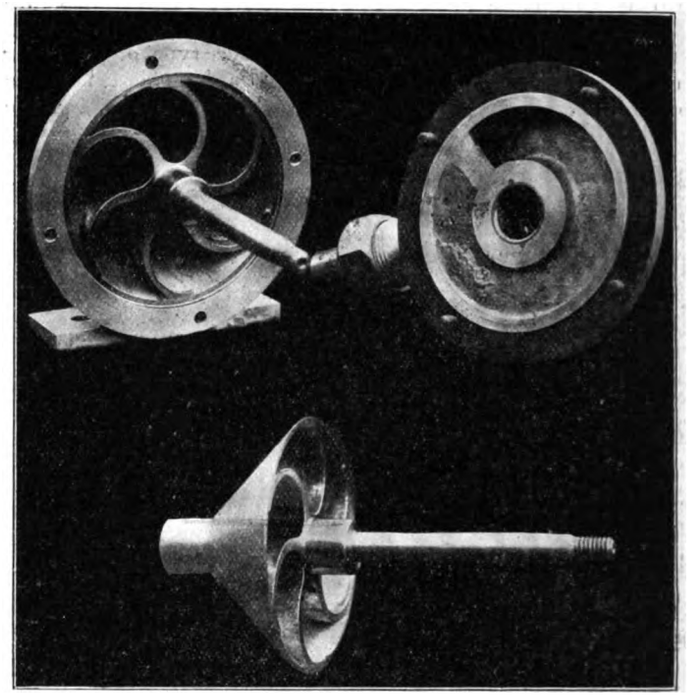

Fig. 5.—Details of Water Circulating Pump.

water. The valves are all mechanically actuated, the inlet valves being arranged on the opposite side to the exhaust, each set having consequently its own cam shaft. The engine is supported from the main frame by four feet cast with the crank chamber, and although the frame is carried low the

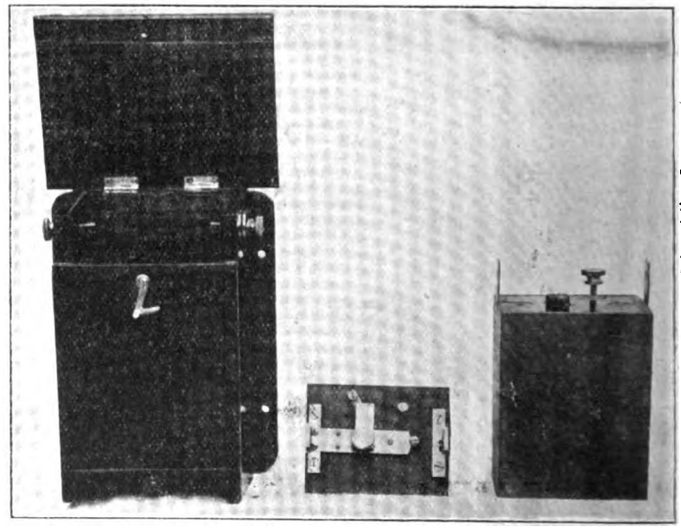

Fig. 6. Views of Parts of Coil Detached.
A Coil Case. B Trembler. C Cartridge.

engine is fixed at such a height as to render all its parts easily accessible without unnecessary stooping on the part of the motorist or his mechanician. At its normal speed of 900 revolutions per minute the engine develops 20-h.p.; it can, however, be run up to 1,150 revolutions, and as low as 180 revolutions. The connecting rods and

Digitized by Google

the crank shaft are of forged steel; the cranks are set at an angle of 180 deg. to each other, the shaft being provided with three bearings, a central one and a bearing at each end. The cam shafts are actuated by large diameter and wide fibre pinions at the forward end of the engine. Compression release cocks (Fig. 2) are fitted to each cylinder.

The water circulation is maintained by a gear-driven pump and a radiator of the frame ribbed-pipe variety. Dealing first with the pump, a general view of this is seen at D, Fig. 2, while it is shown detached in Fig. 5. It is of the rotary type, and it runs at a slow speed—its maximum is 1,200 revolutions per minute—and even with the engine running at its minimum rate an efficient circulation of water is maintained. The pump vanes are cast in a conical-shaped piece enclosed in a gun-metal casing of similar form, the surface of the cone forming a thrust bearing, as an addition to the ordinary bearings on the pump spindle. The pump is fixed so that it can be readily dismounted, and, although not a probable occurrence, the circulation system is so arranged that should any stoppage take place in the operation of the pump, it will still continue by gravity. As already mentioned, the radiator is of the ribbed-pipe variety set in a frame forming the water tank. There are thirteen rows of pipes, in a nest of three deep. Fig. 4 gives sectional views of the radiator, from which it will be seen that the pipes are not placed directly one behind the other, but are "staggered" in such a way that each pipe gets a full draught of air round it. It will also be noticed that by a series of baffle plates in the side tanks the circulation of water is arranged to pass through the tubes in series, to prevent stoppages, and in case of deficit in water supply, to cause the same to flow through the coolest tubes, so assuring maximum efficiency under all circumstances. A sump for collecting any dirt in the water, or for drawing off the latter, is provided at the lowest point in the circulating system.

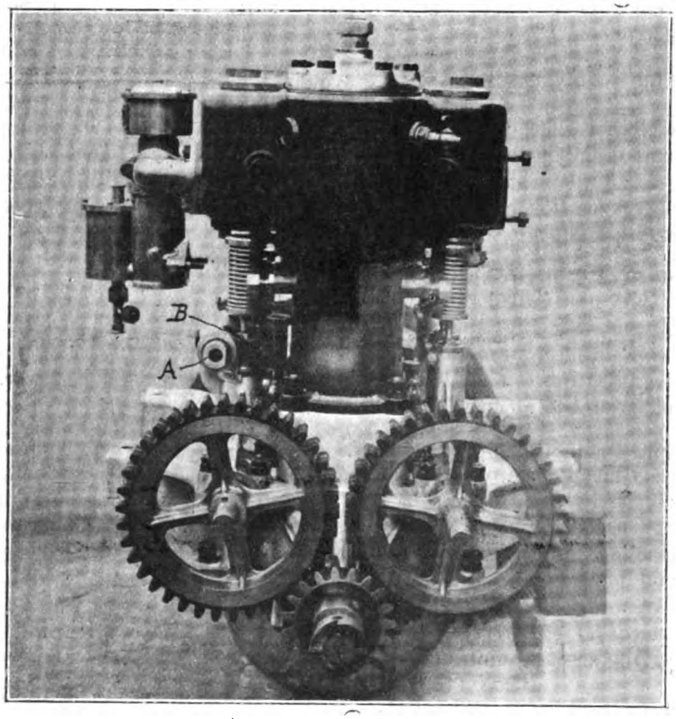

Fig. 7.—Front End View of Engine.
A. Rack Shaft varying lift of inlet valves. B. Star pinion on valve push rods.

Each pair of cylinders exhaust into an asbestos-jacketed pipe, which runs into a main pipe of such a diameter as to act as a sort of expansion chamber for the hot gases ere they reach the silencer proper.

We now pass to a description of the automatically-controlled ignition system. This is of the high-tension type with accumulators, and one coil and trembler for the four cylinders. The commutator and high-tension distributor are mounted in a case on the dashboard, and is so arranged that either can be instantly inspected or cleaned independently of the other. A double-jump spark is provided on the high-tension circuit, showing not only the working of the coil and trembler at all times, but providing

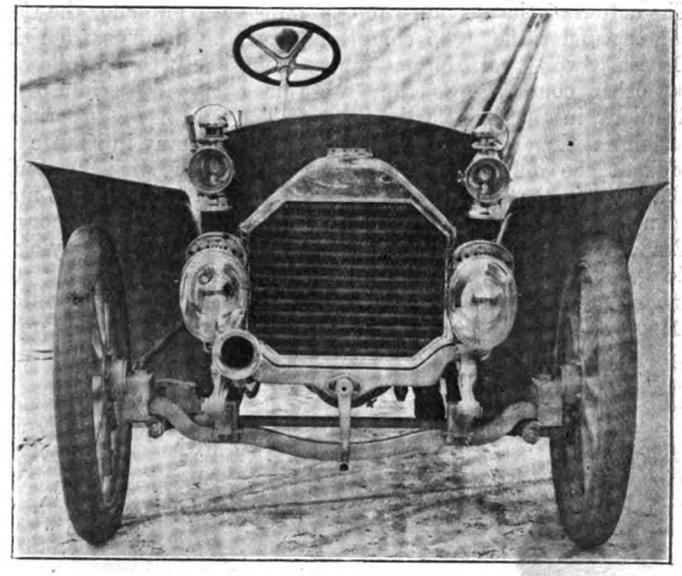

Fig. 8.—Front View of "Brotherhood" Car.

immediate and visible means of detecting any working defects, and of correct adjustment of the trembler to assure the best results. The commutator is driven by positive spiral gear drive from the half-time shaft, combined with a governor automatically varying the advance and retard of the ignition. The coil is of a special high-speed design, arranged so that the windings and condenser are made up in the form of a cartridge, enabling the same to be instantly removed without necessity of detaching the coil case or disconnecting any wires.

Both the high and low tension wires are well insulated with protected terminals. The high-tension wires are encased in an insulated frame, D, Fig. 1, with hinged handled terminals to the sparking plugs, providing convenience for instantly disconnecting them from the plugs for the purpose of removing the latter or testing the cylinders. The accumulators are located in a box immediately below the left hand side of the inclined footboards behind the dash. The wiring is short throughout, the terminals easily accessible, and all contacts and terminals clearly numbered to facilitate tracing circuits. A specially constructed vulcanite 2-way watertight switch is provided, assuring perfect contacts, and easily taken apart for examination or cleaning. A spare of each part of the coil can, if necessary, be carried, so that, should anything go wrong with those in use, they can be readily changed. The coil case, cartridge, and trembler are shown detached in Fig. 6.

(To be continued.)

MR. LINDSAY HOGG, M.P., had an eventful ride in a motor-car the other Saturday while journeying to Newhaven to attend the annual dinner of the Steam Packet Office Staff. Owing to the darkness and the diverging roads the driver experienced some difficulty in finding the way. At length Seaford was safely reached, but, instead of taking the main road to Newhaven, the driver by mistake went in another direction, and in the end the car was precipitated on to the beach. Fortunately nobody sustained any injury, though the services of seven men had to be requisitioned to draw the car out of the shingle.

CONTINENTAL NOTES.

The Gordon Bennett and Grand Prix Joint Race.

The decision of the French Automobile Club to run the Gordon Bennett race concurrently with its Grand Prix event continues the main topic of conversation in motoring circles. The action of the Belgian Club in refusing to enter for the Cup contest under the 1905 conditions, and the protests from the British, Swiss, and German clubs, seem likely to be followed by other countries, so that there is every indication of a deadlock in the big classic event. The storm of opposition which has thus arisen has apparently caused many in France to look at the matter from other points of view, with the result that even in that country the decision of the A.C.F. is not now being viewed with any degree of unanimity. Even Georges Prade points out in "Les Sports" that the A.C.F. is playing a dangerous game in insisting on the Gordon Bennett being run in conjunction with the Grand Prix. If France wins the Gordon Bennett under the proposed arrangement people will discount

The Waterpoort, Amsterdam.

the victory, because of the advantages which she is proposing to secure for herself; but if she is beaten, the defeat will be all the more crushing.

◆ ◆ ◆

Mr. Gordon Bennett's Opinion.

Mr. J. G. Bennett, the donor of the cup which bears his name, has hitherto declined to make any statement concerning the action of the French Club with regard to the Cup race. The Paris edition of the "New York Herald," however, published a leader on the subject the other day, which is taken as expressing the opinions of Mr. Bennett, he being the owner of that paper. Therein the changes which have been made are strongly deprecated. Such changes, it adds, degrade a purely sporting event into a commercial undertaking.

◆ ◆ ◆

Germany and the Joint Race.

Just as we had gone to press last week we received intimation that in consequence of protests by numerous German motorists the Daimler Motoren Gesellschaft had voluntarily foregone the privilege accorded it by the German Club of having two places in the 1905 German Gordon Bennett team, and will retain the right of supplying, without competition, one car only for the Cup contest. The remaining two cars which will represent Germany in the race will therefore be determined by an eliminating trial, in which the builders of the Mercedes may compete. Should no eliminating contest be held, they will claim two places in the team. Following the example of the British and Swiss Clubs, the German Automobile Club has since sent a letter of protest to the A.C.F. The letter states that "We have the honour to inform you that in all probability we shall not be in a position to compete in the Cup race should this be run at the same time as the Grand Prix. As it is probable that other automobile clubs will take the same position in the matter, we beg you, in the interest of the Gordon Bennett, which has become the classic race for automobilists, to run the event distinct from the Grand Prix." There is also some talk in German motoring circles of following France's example by organising a German Grand Prix, the projected course for the race being from Vienna to Berlin.

◆ ◆ ◆

The French Eliminating Trial.

Entries for the French eliminating trial are being sent in at a remarkably slow rate. Up to Tuesday only thirteen cars had been entered, these including three Panhards, one C.G.V., three De Dietrichs, three Darracqs, and three Renaults. The final list, which was to be closed on Wednesday, had not reached us at the time of going to press.

◆ ◆ ◆

A French Touring and Reliability Trial.

Considerable interest is being shown in the touring and reliability trial which the Automobile Club of Seine et Oise will hold from the 19th to the 26th inst. The competition is divided into four categories:—(1) single-cylinder cars; (2) double-cylinder ditto; (3) three and four cylinder ditto; and (4) motor-cycles. So far seventeen entries have been received, including four Serpollets, six De Dions, two Boyers, two Chenard-Walckers, a Decauville, a Krieger petrol-electric and a Sage petrol-electric.

◆ ◆ ◆

The German Motor Volunteer Corps.

The rules of the new German Motor Volunteer Corps, of which Prince Henry of Prussia is honorary colonel, provide that members must be of German nationality, and must possess a car of at least 16-h.p. The members will be liable to be called up for service on not more than three occasions in four years, each period not to exceed ten days.

◆ ◆ ◆

A New Italian Automobile Club.

A new Automobile Club of Italy has just been formed at Turin with the Marquis Ginori as President. Hitherto there have been a number of clubs in Italy, but no real national organisation. This has now been constituted, and takes the place of the former Italian Automobile Union.

◆ ◆ ◆

The Protection of the Hands.

The Prince of Arenberg has given a sum of 500 francs (£20) to the French Club, to be awarded to the person who presents the best arrangement for protecting the hands from cold when driving. Those intending to compete must send in their designs to the Commission Technique of the A.C.F., Place de la Concorde, Paris, before the 15th inst. No scheme in which the driver is enclosed by glass, preventing him from hearing or giving signals to other drivers, will be considered.

◆ ◆ ◆

Public Services in France.

A public service of motor-cars is about to be inaugurated between Saint Vallery, Cayeux, Onival, Mers, and Treport. Arrangements are also in hand for starting a service in April next between Villers-sur-Marne and Plessis-Trevise.

◆ ◆ ◆

Another Touring Competition.

The Automobile Club of St. Etienne has decided to organise a touring car competition for the 9th April next. The course is over a distance of 213 kilometres, and, starting and finishing at St. Etienne, takes in Firminy, Monistrol, St. Agrève, Bourg-Argental, and Planfoy.

Digitized by Google

HERE AND THERE.

THERE are now said to be 700 registered motor-cars in St. Petersburg.

A SYNDICATE is in course of formation to run a service of motor-'buses at Oxford.

THE "AUTO" ENGINEERING COMPANY has a garage which is always open at North Street, Leeds.

THE METROPOLITAN MOTOR ROAD-CAR COMPANY, LIMITED, has been registered with a capital of £100.

A FINE display of wheels for public service automobiles is made by Messrs. Bayleys, Limited, at the Crystal Palace.

A COMPANY has just been formed at Caserata, Italy, to establish a number of public motor services in the province of that name.

THE SOCIETE ANGLAISE DES AUTOMOBILES, LIMITED, has been registered with a capital of £5,000 to carry on the business indicated by the title.

THE IRISH MOTOR-CAR COMPANY, LIMITED, has been registered with a capital of £1,000 to deal in automobiles. The registered office is at 17, Golden Lane, Dublin.

BY the help of two motor-cars provided by the West-End Motor Company, Limited, Mr. S. Mayo is appearing at nine music-halls in London every night.

THE number of motor-cyclists in the United Kingdom is computed at 29,000.

A MOTOR mail service is about to be inaugurated between Nantes and Paimbœuf, France.

THE COMPENSATION GEARING SYNDICATE, LIMITED, has been registered with a capital of £1,000.

A CENTRAL garage with accommodation for fifty cars is about to be established at Hastings.

A SERVICE of motor-'buses will commence to run from Southborough to Tunbridge Wells at Easter.

MR. W. H. FOWLER will carry on the Hockley Hill Garage, Soho Hill, Birmingham, his partnership with Mr. E. W. Cashmore having expired.

THE Richard-Brasier car on which Thery won the 1904 Gordon Bennett race has been acquired by Baron Fedor Nicolics, a well-known Austrian sportsman.

THE Germain motor garage at 8, Earl Street, Westminster, is replete with every convenience for the storage and repair of cars. A system of subscription tariff has been adopted by the proprietors.

THE Turner-Miesse steam cars will be exhibited on the Duryea Stand at Olympia, and a large display of these vehicles will also be made at the Motor-Car Exhibition at the Agricultural Hall next month.

A Scotte Train in the French Military Manœuvres.

THE FORMAN MOTOR COMPANY, LIMITED, ask us to mention that the dimensions of the 18-20-h.p. four-cylinder engine illustrated in a recent issue are 90 mm. bore by 110 mm. stroke.

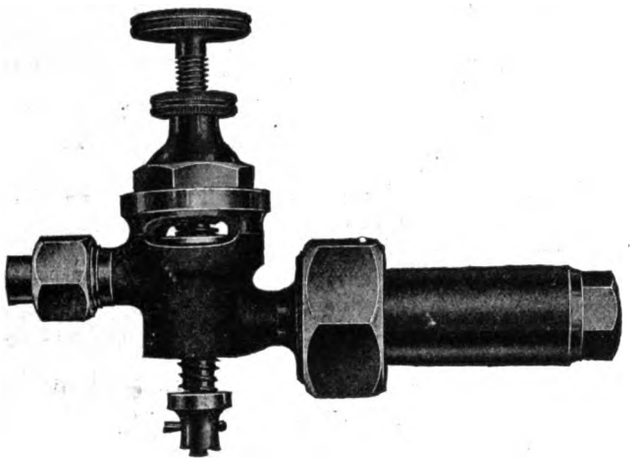
MESSRS. MATTHEW WELLS AND CO. have issued a new price list of their "Wellsaline" motor oils, for which they are now appointing agents in towns where they have not previously been represented.

MESSRS. FRISWELL, LIMITED, have just thoroughly overhauled the machinery of a motor-car in five working days, the work done including the fitting of new brasses to the engine, examining every detail of the parts, and repainting and upholstering the body.

THE annual dinner of the Motor Volunteer Corps, at which Lord Roberts is to be the principal guest, has been postponed from the 13th to the 14th instant. Among those who have accepted invitations are Lord Methuen and Sir John French, both of whom have had experience of the value of the corps at manœuvres and elsewhere.

AT the meeting of the Edmonton Board of Guardians, upon a question being raised with respect to a proposed expense in connection with the motor-car which was purchased for the removal of lunatics to the asylum, the vice-chairman stated, amidst laughter, that the car was the best investment the Board had ever made, as there were now twenty-five per cent. fewer cases being removed to the asylum.

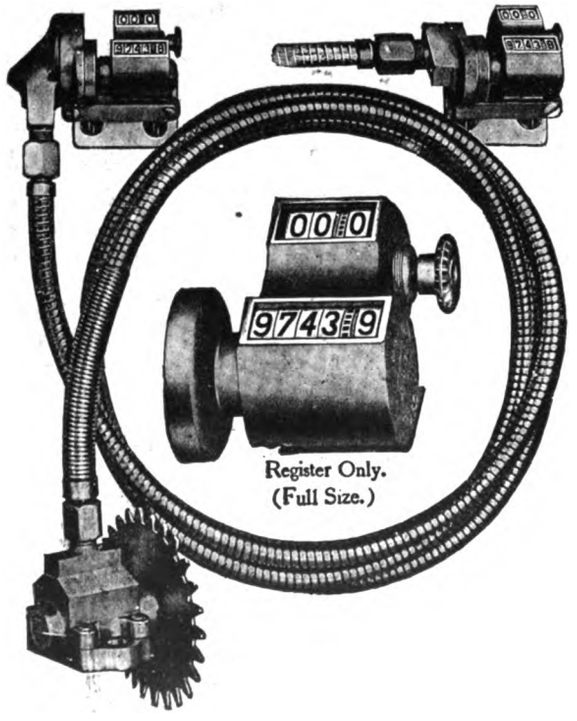
LAST year 602 foreign-built motor-cars were imported into the United States. Their value, according to the Customs appraisers, was £441,898, or an average of £734. During 1903 only 375 foreign cars were imported.



THE reconstruction of the Lanchester Motor Co., Ltd., has now been successfully completed, new capital having been introduced. The support accorded to the company in the past season, under the difficulties of reconstruction, has been most gratifying, and the promise of business for the forthcoming season exceedingly satisfactory. This company is now known as "The Lanchester Motor Co., Ltd."

THE RICHARD-BRASIER COMPANY last week gave a dinner to its employees to celebrate the victories of the Richard-Brasier car during 1904 and the promotion of M. Brasier to the Legion d'Honneur. Over 600 were present at the dinner, at which it was announced that the company had decided to give a sum of £1,000 towards the funds of a provident society which is being formed in connection with the works.

THE name of the New Orleans Motor Company, Ltd., has been changed by the omission of the word "New." The necessary permission of the Board of Trade has been obtained, as the directors were able to tell that authority that the public was under the impression that the New Orleans car was of American manufacture, which was not a fact. The company will in future be known as the Orleans Motor Company, Ltd.



Digitized by Google

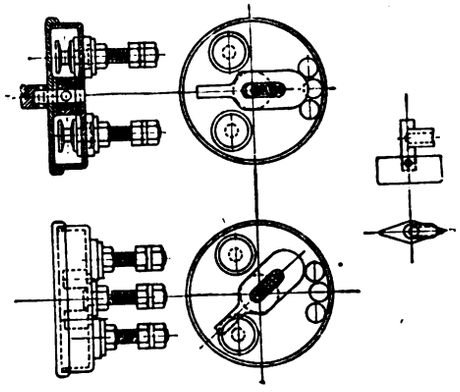
The accompanying illustration depicts a combined double-acting pressure valve and filter chamber lately introduced by the Coventry Motor Fittings Company. The valve is used where the pressure of the exhaust gases of a petrol motor is utilised for any purpose, such as pressure lubrication and

supplying the carburettors with petrol when the tanks are below the carburettor level.

Messrs. Markt and Co. have lately introduced a new form of Veeder odometer, so arranged that it can be mounted on the dashboard where the dials can be easily read. The instrument has two registers, one of which may be set back to zero at the start of each day or trip, while the other keeps a record of the total distance travelled. Both registers indicate in tenths of miles, the right hand figure on each being in red. The odometer is operated by gears and flexible shaft drive from the left front wheel of the car. It is made in two patterns; in one the shaft is introduced straight into the side of the instrument, as shown in the upper right hand corner of the

Register Only.
(Full Size.)

illustration; in the other it is brought up straight from the floor of the car or through the dashboard directly behind the instrument, the movement being conveyed to the odometer by small incased bevel gears. The registering dials are shown in full size in the centre of the illustration.



Mr. Seymour Browne has been elected hon. secretary of the Isle of Thanet Automobile Club, which has been formed at a meeting held at the Britannia Hotel, Margate.

The Stanley Electric Carriage Company, Limited, has been registered with a capital of £10,000 to adopt an agreement with Messrs. A. E. Gadd and G. Stephenson, and to deal in motor-vehicles.

The Langdon Davies Motor Company, Limited, has been registered with a capital of £5,000 to adopt an agreement with the Langdon Davies Motor Company, Limited. The first directors are Messrs. F. B. O. Hawes, A. W. Cree, F. W. Hartman, and E. Yatman.

Mr. R. J. Corbet is forming the Driver-Mechanic and Motor Drivers' Agency, with a view to obtaining situations for qualified men of good character. A notable feature of the enterprise will be that no fee for registration of names will be required.

We herewith illustrate a new switch which has just been put on the market by Messrs. Brown and Barlow, Limited, Birmingham. The apparatus is so designed as to give a high efficiency and at the same time it is simple, having but few working parts. It is also practically dust and water proof and the contacts are made with a rubbing motion. From the drawings it will be noticed that the switch is composed of primarily four pieces—the case, the two insulated terminals and the contact piece. The action of the latter is somewhat peculiar. Assuming that the switch is in the off position, then when

either switched on to the right or left hand insulated termina the central piece first rises over the two pegs in the base and then gradually falls on to the other side, this being in addition to the rotary motion imparted to it by the handle. By this means the small end of the contact piece when engaging into the tapered grooves on the terminals has a sliding motion, which will keep the point of contact clean however dirty the other portion of the switch may be. The switch itself can be readily taken apart for inspection by simply unscrewing the cap, when the cap, together with the contact piece complete, comes away.

On Saturday last, on its return from Southampton, in the 5,000 miles reliability trial under the supervision of the Automobile Club, the 12-h.p. Siddeley car completed 3,650 miles. There had been no involuntary stops from the start due to mechanical troubles. The Continental tyres by running 2,536 miles without a puncture now hold the record. This week, the fifth of the trial which is drawing to a close, the Siddeley car is covering the South Coast routes.

Messrs. J. B. Brooks and Co., Limited, Birmingham, have lately introduced a non-slipping cover for the tyres of motor vehicles. It is made throughout of chrome leather, consisting of an outer lining, on the tread of which is attached a band containing rows of steel studs, and which, owing to the tubular formation of their stems, and the fact that they are spun or riveted over at the back, cannot pull through. The whole fabric is stretched and shaped to the curvature of the tyre by a special process, and affords protection to the whole interior of the cover.

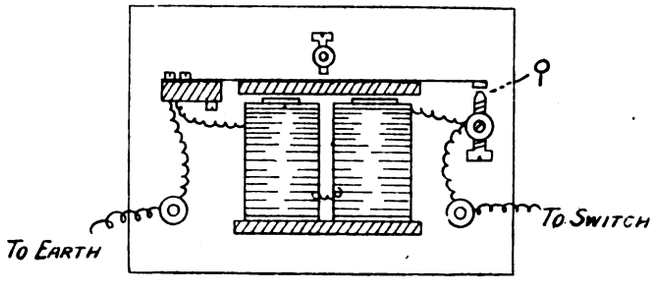
AN ELECTRIC GOVERNOR FOR INTERNAL COMBUSTION ENGINES.

AN ingenious electric governor for petrol motors and other internal combustion engines has recently been devised by Mr. G. A. E. Roberts, of Twyford, near Winchester, in which the coils of an electro-magnet are connected up in series with the primary circuit which forms a portion of the ordinary electric ignition. The coils must have sufficient resistance to prevent a spark taking place at the ignition plug capable of



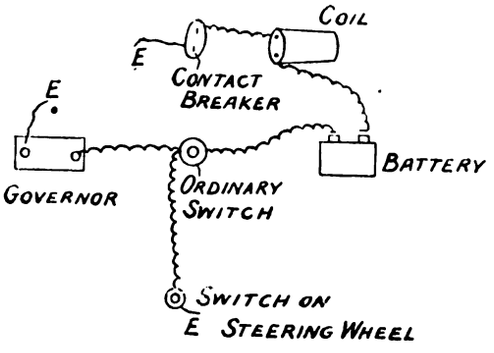


Fig. 1.

ig. 2.

properly firing the charge in the cylinder. A moving armature is placed near the poles of the electro-magnets, which, being attracted to the latter, closes the primary circuit and cuts out the wire on the electro-magnets and thus allows a proper spark to take place. The armature is drawn back by a spring, and by regulating the strength of this spring and varying the stroke of the armature by means of adjustable screws, the pace of the engine can be regulated to the required speed, when the screws can be permanently fixed.

Referring to the accompanying drawings, Fig. 1 shows the governor, and Fig. 2 the method of wiring. Commencing at the battery the current passes from one pole round the coil to the contact breaker and thus to earth. From the other pole of the battery it passes to the usual switch, and then, instead of being earthed in the ordinary way, it has two alternatives, either to pass through the governor to earth or by means of the switch on the steering wheel direct to earth, in which case the governor is cut out and the circuit is as usual. When it is required to put the governor in action, the switch on the steering wheel is switched off; the current then has to pass round the coils of the magnets and consequently no efficient spark takes place, but the armature is attracted, and contact is made at the platinum points Q, Fig. 1; the current then bridges across the armature, short circuiting the coils, and cutting them out so that an efficient spark takes place at the moment of contact.

The advantages claimed for the electric governor are as follow:—1. It is cheap, costing only a few shillings; 2. It is easy to fix, only a few extra feet of wire being necessary; 3. There are no extra complications to the engine with parts to be kept lubricated, etc.; and 4. Should anything go wrong, the switch on the steering wheel cuts the governor out. With this governor, Mr. Roberts informs us that he can leave his car standing, and it will immediately slow up to its minimum speed and will continue running without gradually gaining speed and "racing." Furthermore, in coasting down hills with the clutch out, it is possible with a slight movement of the finger to slow up the engine and glide down almost noiselessly and in a moment to be once more on full power.

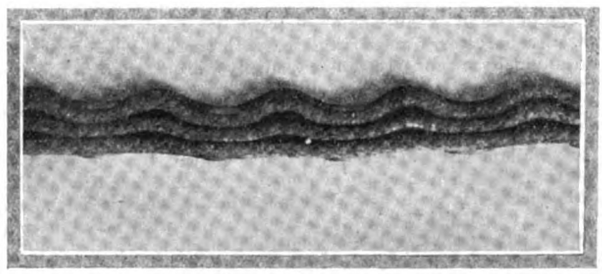
MOTOR CYCLING NEWS.

DURING the motor week to be held at Munich during the coming summer, in connection with the Herkomer touring competition, the German Motor-Cycle Union proposes to organise an international endurance motor-cycle trial. The programme will include a speed test and a hill-climb up the Kesselberg.

◆ ◆ ◆

ARRANGEMENTS have been made by which motor-cycle clubs affiliating with the Auto Cycle Club can do so on payment of 2s. for each motor-cyclist in the club. The general meeting of the council of the club will be held in March, when the election of officers for the year will take place.

◆ ◆ ◆



THE Motor-Cycling Club have, elected the following committee for 1905:—Messrs. Reeves, Cowles, Fry, Abraham, Van Hooydonk, Perman, Johns, Kennett, Sewell, Jenkins, Wells, and Chester Fox. Mr. A. Candler has been elected secretary, Mr. March has been re-elected treasurer, and Mr. W. C. Brown trials hon. secretary.

◆ ◆ ◆

THE Auto-Cycle Club have, in accordance with the rules governing the International Cup race for motor-cycles, sent the necessary challenge, accompanied by a deposit of £40, to the French club. Several English makers have already announced their intention of taking part in the selection trials to be held in May next. Appeal is being made for a special fund, so that the makers who are successful therein may be relieved of the expense of the final contest.

◆ ◆ ◆

THE Rex Motor Manufacturing Company are introducing a new driving belt for motor-cycles, which for simplicity and efficiency they claim has proved a great improvement on the ordinary type of belt. It is made of three-ply Balata, and is unstretchable. Its chief value lies in the tenacity of its grip at the point where it pulls over the driving pulley. An efficient belt to transmit power without loss of power should be made in such a manner as to preserve the top ply taut on the drive and slack on the bottom ply. This disposition is adopted in

the new belt, the grip of which allows it to be adapted to the pulley without over-tightening, and when in action the gripping parts come into play automatically. As soon as the belt can be made in sufficient quantities the Rex Company will adopt it as their regular transmitter.

THE annual dinner of the A.C.G.B.I., which was to have been held on the 15th inst., has been postponed, in consequence of Court and Parliamentary engagements detaining those who were to have been the principal guests.

THE CRYSTAL PALACE SHOW.

—♦—

On Friday last week the show at the Crystal Palace was opened to the public; it closes to-day (Saturday.) The support accorded to the exhibition by the trade has been very meagre, and the *Times* had to confess that all did not seem well with the Show. Certainly we looked in vain for anything like a representative display of any department of the industry. Below we refer to practically all the exhibitors who have ventured to attend the Crystal Palace this year.

In addition to the *chassis* of a 12-h.p. Leonard double-cylinder car recently illustrated in the *Journal*, Messrs. J. J. Leonard and Company exhibit one of the latest 12-16-h.p. M.M.C. cars and the "Medici" car. As the name implies, the latter is specially designed for the use of members

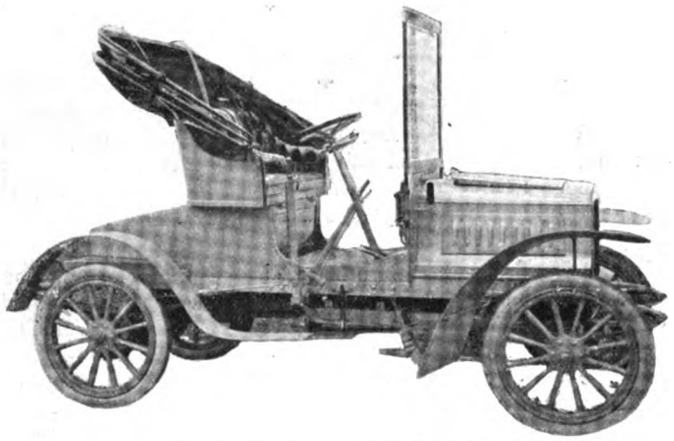

Fig. 1.—The Leonard "Medici" Car.

of the medical profession. To this end the car, a two-seater, is provided with a hood and front glass for the protection of the occupants in bad weather. We gave an illustration of the vehicle in Fig. 1 and may say that, while built on the standard lines of live axle cars, it is being sold at a very moderate price, especially having regard to its power. The engine is a double-cylinder Tony-Huber developing 10-12-h.p. The pump is friction driven and the radiator is provided with a fan to assist the cooling. Three forward speeds and a reverse are available, while ample brake power is provided.

The Gratze Patents and Engineering Syndicate, Limited, exhibit their speed indicator, the first of which was shown at the Agricultural Hall Show last year. This shows at a glance the speed at which the motorist is travelling, and by merely touching a button the pointer is fixed at the exact speed the car was travelling when stopped, while an electric alarm rings on a fixed speed being attained.

The Pivot cars, reference to which was made in our report of the Paris *Salon*, are shown for the first time in this country by Mr. P. Cuthbertson, two handsome cars, a limousine coupè and a side entrance double phaeton, both of 24-h.p., being on view. The vehicles, while not comprising any startling deviation from standard practice, show evidence of careful construction. The pressed steel frame is mounted on equal sized artillery wheels running on ball bearings. The motor has mechanically operated valves, the inlet and exhaust being on opposite sides. Magneto ignition, automatic carburettor, framed radiator with vertical gilled tubes, and induced draught by means of a fan-shaped fly-wheel, are other features of the car. The water circulation is on the thermo-syphon system, no pump being employed. Four speeds and a reverse are provided, the transmission being through a cardan shaft and live axle.

The Hallamshire *chassis* and cars shown by Messrs, Durham, Churchill and Company, bear evidence of the fact that this well-known Sheffield concern has made great advances during the past twelve months. The 10-12-h.p. polished *chassis* has a wood frame with steel flitch plate; the motive power is supplied by a Forman four-cylinder motor, the cylinder dimensions being 80 mm. diameter by 85 mm. bore. The carburettor, which is hot water jacketed, is provided both with an auxiliary air inlet and a "snifting" valve, cold air being drawn through the latter into the cylinder when the throttle is closed. The friction driven pump is held to the flywheel by a spring device, so maintaining regular contact therewith. The framed ribbed-pipe radiator is provided with a air-inducing fan. The clutch is of the enclosed metal-to-metal type, and three forward speeds and a reverse, with direct drive on top speed, are available, the power being transmitted through a cardan shaft and bevel gear to a live axle. The motor is controlled by levers on the top of the steering wheel, the sector being, however, so arranged that it does not move with the steering wheel, and is therefore always conveniently located. The clutch and brake pedals are of the push type, while the accelerator pedal is of the press-down variety. The firm also exhibit a 10-12-h.p. double-cylinder tonneau with Aster motor, and a 14-18-h.p. side-entrance double-phaeton, with four-cylinder Aster engine. The latter is undoubtedly the finest car Messrs. Durham, Churchill have turned out, and is well worthy of close inspection.

A new and novel form of silencer for petrol motors is exhibited by Messrs. Glaskin and Company. The outer casing, which is open at both ends, contains within it the exhaust box in which the hot gases are broken up by being caused to pass along several tortuous passages. They emerge through a nozzle about the centre of the outer casing, which at this point is so shaped that as the gases are emitted a vacuum is formed and a strong current of air drawn through the casing. The forward end of the latter is coupled up to a pipe which extends behind the radiator, where the air is sucked in, so assisting in cooling the water in the latter. A drawing is also shown of a new automatic air-regulating attachment for carburettors which Messrs. Glaskin are about to put on the market.

An exceedingly varied exhibit is that of the N.A.G. Automobile Company of Great Britain and Ireland, Limited. We first inspected the *chassis* of a 20-24-h.p. car which is built on the standard lines of chain-driven cars. The engine, which comprises four cylinders cast in pairs, has cylinders 105 mm. diameter by 125 mm. stroke. The valves are arranged on opposite sides and are all mechanically actuated. The ignition is by gear driven low tension magneto. The cars are controlled by levers on the steering wheel. The radiator is of novel construction, consisting of a close mass of vertical tubes, set in a circular frame, which also forms the water tank. The cage of tubes is simply bolted into the reservoir, and the joint is made watertight by a packing of lead or other suitable material. A large diameter clutch is employed, and a feature is that the leather is not fixed on the female cone but on the inner face of a flange bolted to the fly-wheel, the flange being readily detachable in two parts should it be necessary to renew the leather. The change-speed gear is of the Mercedes type, giving four speeds forward and a reverse. The chain wheels are connected direct to the hubs of the back wheels, and not to the spokes, so avoiding the boring and consequent weakening of the latter. Ball bearings are used both in the gear-box and in the road wheels. The foot brake acts not on the differential, but on the forward end of the second motion shaft of the gear-box. The side brakes act independently of the

Fig. 2.—The "N.A.G." 6-8-h.p. Delivery Van.

clutch, and are arranged to pull up. A governor is provided, this being arranged to act only when the clutch is withdrawn. Altogether the car is an excellent specimen and does credit to its builders, the Allgemeine Electricitats Gesellschaft of Berlin. A complete 20 - 24-h.p. car with seven-seated side entrance body, is shown, this being a replica of the type used by the German military authorities for inspecting outlying forts. Of the 10 - 12 h.p. double-cylinder cars a side entrance double phaeton and a landaulet are displayed. These are on similar lines to the 20 - 24 h.p. car, except that the transmission is by a cardan shaft and live axle, in place of side chains. Much interest is being shown in a 6 - 8 h.p. double cylinder motor-cab, with live axle drive and seating capacity for four persons. A number of these vehicles are plying for hire in Berlin, a feature being the provision of a device known as a "taxameter," by means of which, before starting the journey the machine is set to register by one of three tariffs, according to arrangement, and when the trip is finished it shows the amount to be paid. Fig 2 depicts the N.A.G. 6-8-h.p. double-cylinder delivery van designed to carry a load of 15 cwt. The company are also going in extensively for the construction of heavy petrol lorries, and have on view one fitted with a 10-12-h.p. double-cylinder engine, and designed to carry a load of three tons. Four speeds forward and a reverse are provided, the transmission being by side *chassis*. The various details of the vehicle

Digitized by Google

appear to have carefully designed to withstand the rough work such wagons are called upon to perform.

The BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, LIMITED, of which Mr. F. F. Wellington is now the manager, have a very handsome stand, on which are to be seen quite a number of types of cars, including an 18-24-h.p. Mercedes car with Rothschild side entrance body, a 20-h.p. Bollée, a 24-32-h.p. Fiat *chassis*, a 20-h.p. Hotchkiss, and a 16-20-h.p. Clement-Talbot, all of which have already been described in the *Journal*. A new comer is seen in a 15-18-h.p. Altona car. This is a vehicle of Belgian construction and contains several points of interest. The motor comprises four separate cylinders, 90 mm. dia. by 110 mm.; it develops 18-h.p. at 1,000 revolutions. The carburettor is a Longuemare automatic one with throttle. The regulation of the motor is effected by a pedal, and also by a hand-lever on the steering wheel. Ignition is by coil and accumulators. The friction clutch is made in two parts, which allows

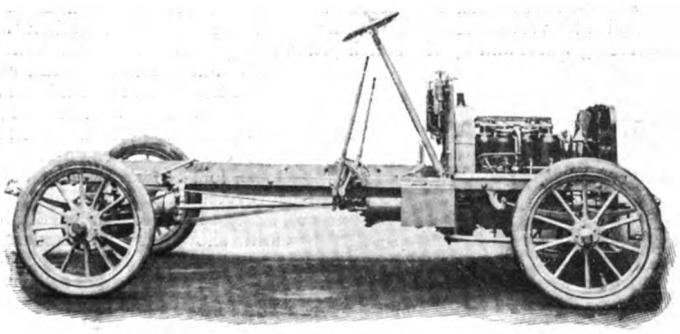

Fig. 3.—Chassis of Altona 15-18-h.p. Car.

the leather to be quickly changed when necessary without dismounting any part of the gear-box. The complete clutch is made entirely independent of the motor and the gear-box, by means of a single bolt uniting both sides of the coupling sleeve. The clutch pedal is mounted directly on the shaft of the fork which compresses the spring. The gear-box is connected to the motor by an aluminium shield, and forms a rigid joint which ensures the parallelism of the shafts. Three speeds and a reverse are provided, the drive on the third speed being direct, the second motion shaft in the gear-box, on this speed, remaining stationary. Transmission is by a cardan shaft and bevel gear to a live axle. The road wheels turn on the live axle casing, and are driven by squares on the ends of the axle. The frame is of armoured wood, to which the motor and gear-box are directly attached. The car is fitted with a double phaeton side entrance body, and from experience we can state that it not only runs quietly but is speedy both on ordinary roads and hills. One end of the stand is devoted to a display of the Spyker cars, for which the Syndicate has taken up the general agency. The new points

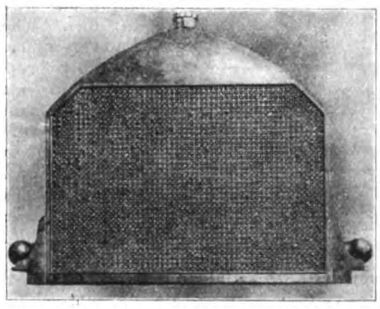

Fig. 4.—The Spyker Radiator.

in the Dutch built cars were explained to us by Mr. A. House, of Bradford. The novelty of the exhibit is the chassis of a 32-40-h.p. four-cylinder car (Fig. 5). The frame is of pressed steel filled in with ash, while the engine (Fig. 6) has the cylinders cast in two pairs, the inlet valves being on one side and the exhaust on the other, all being mechanically actuated. It is in the transmission, however, that the principal feature lies. The power is transmitted through a leather-faced clutch to a gear-box, from which extend two cardan shafts, one driving on to the rear axle and the other on to the front one, so that all four road wheels are driven. No less than three differential gears are employed, one on each of the axles and one in the gear-box. It is claimed that the car is proof against side-slip, and that steering is no way affected. The gear-box is adapted to give three speeds forward and a reverse. We noticed that the live axle does not carry the weight of the car, the road wheels being mounted on a sleeve, and having the power transmitted to them through the axle ends. As regards the standard Spyker cars, these are shown in two sizes, 12-16-h.p. and 15-20-h.p., both having four-cylinder engines. The car follows the usual lines of cardan shaft transmission vehicles, among the features being the ready means of access to the pinions in the gear-box, and the pivots of the front wheels, which are entirely enclosed and work in an oil bath. Ball bearings are used throughout, while the brakes are of the metal-to-metal type. The honeycomb radiator used on the (Fig. 4) Spyker cars is also worthy of notice. The square tubes are fitted with a screw thread, by which means what can be best be described as a whirl wind is created, the air induced by the fan not only impinging on the entire surface of the tubes, but is drawn through at a high speed. Owing to the increased cooling effect obtained it is claimed that the radiator may be built 25 per cent. less in weight and with 25 per cent. less surface than the usual type.

Interest at the stand of the LONDON and PARISIAN MOTOR COMPANY, LIMITED, is principally centred on the *chassis* of the 1905 Hotchkiss 17-25-h.p. car, the feature of which is that all the shafts, even the crank shaft, run on ball bearings. Although the general lines of the vehicle are the same as last year, a number of detail improvements have been introduced. The engine has cylinders 112 mm. diam. and 120 mm. bore, and is stated to develop about 32-h.p. on the brake. The ignition is by low tension magneto, gear driven. The radiator is of the honeycomb type, of a circular shape; the tubes of the honeycomb are of a

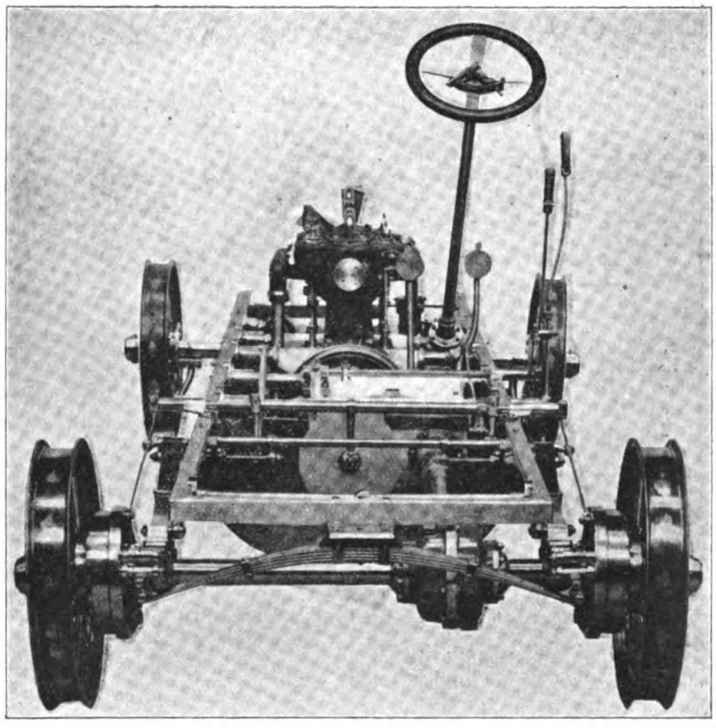

Fig. 5.—Rear View of Spyker Four-wheel Driven Car.

triangular section, giving a large radiating surface. The clutch is on novel lines; it is of the leather-faced type, and is provided with a locking device which prevents any tendency to slip. Four speeds forward and a reverse are provided, the power on the top speed being transmitted direct to the rear live axle through a cardan shaft and bevel gearing. The rear axle is entirely enclosed and does not carry the weight of the car; the road wheels are mounted on the axle casing, and have the power transmitted to them through the axle ends. The bevel gear has been strengthened, a bearing being now provided behind the small bevel pinion.

THE STAR ENGINEERING COMPANY have a large stand, but very few cars on view, this state of things being, we understand, due to the fact that the firm is considerably behind with its orders, and consequently not in a position to prepare any vehicles for exhibition. At the time we called at the stand only a couple of the popular 7-h.p. double-cylinder Little Star cars were on view, although we were informed that one of the latest 10-h.p. four-cylinder vehicles with several improvements was expected to be staged before the close of the Show.

Cort's non-skidding motor tyre band is shown by the MARKET HARBOROUGH RUBBER COMPANY. This is made of chrome leather, the distinctive feature being that the steel studs can be renewed when worn. A

Digitized by Google

similar band with rubber pads in place of steel studs is also shown, the pads being similarly renewable.

The GENERAL ACCIDENT ASSURANCE CORPORATION, of the Motor Advisory Board of which Colonel Mark Mayhew is chairman, with Mr. Alfred Nixon as manager of the motor department, take advantage of the occasion to draw attention to the facilities they offer for the insurance of automobiles.

Messrs. G. T. RICHES AND Co., representatives in this country of the "Eisemann" high-tension magneto-ignition, have a large display of accessories, including the Eisemann combination plug. This has a porcelain interior, dispensing with the trouble of mica heads. The mica exterior obviates trouble with cracked porcelains, so that the plug is practically indestructible. The Simplex ignition recently fully described in our pages is to be seen at this stand. There is also a good type of lubricator with force feed to each bearing, and the firm are extending their business in small parts, packing these in neat boxes for postal dispatch.

Messrs. R. REYNOLD JACKSON AND COMPANY display one of their popular little 6-h.p. Jackson dogcarts with the engine under a bonnet at the front, and also one of the 8-h.p. Jackson tourist cars, both of which are worthy of the notice of those looking for moderately priced vehicles. In addition to their 8-h.p. two-seated car, the HORLEY MOTOR COMPANY exhibits a 9-h.p. tonneau car fitted with a single cylinder having mechanically-actuated inlet valve. The vehicles follow the usual lines of cardan-shaft driven cars, their most noticeable feature being the moderate prices at which they are sold. A novel form of three-wheel, two-seated car is to be seen at the stand of the NEW KYMA CAR CO. The motive power is supplied by a twin-cylinder engine which is connected by a short chain drive to a gear-box, giving two speeds; side chains then transmitting the power to the rear road wheels, which are of the cycle type. No differential is employed, its place being taken by free wheel clutches mounted within the sprockets on the cross shaft. A three-wheel delivery van on similar lines is also shown, the rear wheels being, however, of the artillery type shod with solid rubber tyres. The van is designed to carry a load of 5 cwt.

A couple of highly-finished electric laudaulets are to be seen at the stand of the KRIEGER ELECTRIC CARRIAGE SYNDICATE, LIMITED. The Krieger system has already been described in the *Journal*, but it may be mentioned that two 4½-h.p. compound electric motors drive the front road wheels through spur gearing. The electrical energy is furnished by a battery of forty-four Fulmen or Société de Metal accumulators, one charge of which is stated to be capable of running the vehicle a distance of forty-five miles. The control, which is so arranged as to be easily manipulated, is adapted to give six forward speeds, two battery recuperating positions, one electric brake and a reverse motion. We understand that over fifty of the Krieger vehicles are now in use in the London district. The SCHEELE ELECTRIC CARRIAGE COMPANY exhibit an electric vehicle of novel construction, inasmuch as it is provided with two bodies—a brougham and a victoria, either of which can be readily substituted for the other. An eleven-seated omnibus, with solid rubber tyres, is also on view. In the Scheele system, which hails from Germany, two 5-h.p. motors suspended on springs and running on ball bearings drive the rear wheels through spur gearing. The battery consists of forty cells of the Hagen type, having a capacity of about 190 ampere hours, sufficient to run the vehicle a distance of from forty-five to fifty miles on one charge. The controller is arranged to give five forward speeds and two reverse motions.

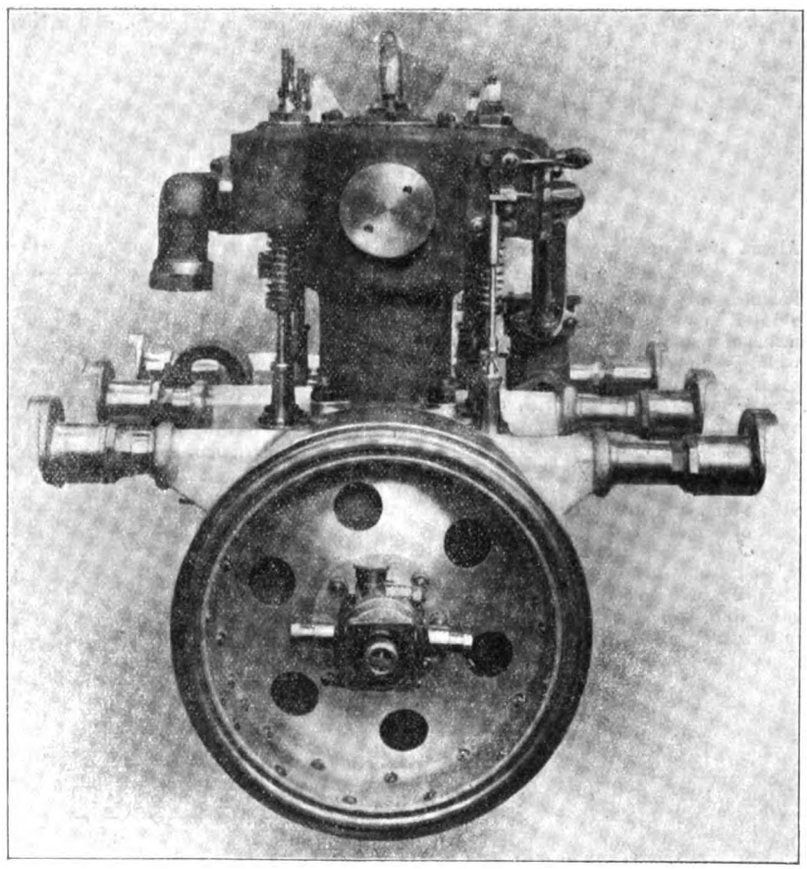

Fig. 6.—Rear view of Spyker Four-cylinder Motor, showing Clutch.

Examples of three of the sizes of the Brouhot cars are shown by the BROUHOT MOTOR COMPANY, LIMITED, of Great Britain, viz., 12-14 h.p., 15-18-h.p., and 20-24-h.p., all having four-cylinder engines. All the valves, both inlet and exhaust, are mechanically actuated off one cam shaft. The ignition is by magneto or by coil and accumulator and a dynamo. The carburettor has automatic regulation of the air in order to give the correct mixture at any or all speeds. A device is also provided whereby the lift of the inlet valves may be varied and the speed of the engine consequently controlled. Pump circulation is adopted in conjunction with a honeycomb cooler, through which a current of air is drawn by a belt-driven fan. The transmission is by side chains, the drive on the top speed being direct. An ingenious form of friction clutch is employed to connect the engine with the gear-box. Among the detail improvements worthy of notice may be mentioned the chain-adjusting device and the steering bar, which is now located behind the front axle. On the same stand is also to be seen one of the latest 20-h.p. Dechamps cars fitted with a side-entrance double-phaeton body. The engine has mechanically operated inlet valves provided with a variable lift, actuated both from the steering wheel and by the clutch pedal, the speed of the motor being thus automatically reduced when the clutch is withdrawn, the use of a governor being also in this way dispensed with. The car is of the chain-driven type, four-speeds forward and a reverse being available.

Madame MARA, of Bradford, shows the "Crusader" motor-cap for ladies—an effective piece of millinery well designed for motor touring. Garlio is again to be seen on the stand of Messrs. M. and E. MARX, who report its continued favour with motorists as a polishing cloth for the bright parts of their cars.

Messrs. BEARDMORE AND COMPANY illustrate their work for the motor-car trade by a selection of pressed steel frames for cars of 12-h.p., 16-h.p. and 24-h.p. respectively, with hydraulic riveted joints. Sections of rivet joints, pressed steel sections of different sizes and flanged steel plates are also exhibited on this stand, which will appeal to everyone interested in motor vehicle construction.

Messrs. W. H. WILLCOX AND COMPANY, LIMITED, have their usual wide range of motor engineers' stores and lubricating oils. The latter are of known efficiency, and are specially prepared for steam cars and motor-wagons, as well as touring cars and the parts thereof. Motor greases are also shown, as well as gear and chain greases and general lubricants. Among the accessories will be found an aluminium-cased "Centrifugal" motor pump in two sizes, to run at from 1,800 to 2,400, and from 1,400 to 2,300 revolutions per minute respectively. A collection of motor kits and tools of every kind will be inspected with interest by every motoring visitor to the Palace.

The patent motor-car whistle illustrated in our issue of December 3rd last is shown by the MOTOR PATENT APPLIANCES COMPANY, whose new device for warning other users of the roadway of the approach of a car is attracting much attention on the Continent. A new Quick-Grip cone spanner will be found on the stand of Messrs. A. G. TAYLOR AND COMPANY. This is on the same principle as the well-known spanner familiarised to motorists by Mr. Taylor, but is made only 1-16 inch thick, so as to be available for adjusting the bearing cones of small car wheels, taking any cone, irrespective of shape. Mr. J. F. JANES makes a display of accessories for motor-cycles, including a switch which can be operated by the slightest pressure on a finger lever.

A novelty at a motor-car exhibition is a display of artificial horse-hair from the GROVE MILLS, Mitcham, who also show some good types of cushions for cars, stuffed with their speciality.

Digitized by Google

Among the firms which have recently produced a three-cylinder car is Messrs. Horsfall and Bickham, an excellent specimen of which is shown on their stand. We give an illustration of the car in Fig. 7. The frame of the vehicle is built of ash with steel flitch plates; the engine, situated in the fore part under the bonnet, comprises three separate cylinders 80 mm. diameter by 90 mm. bore, and is designed to develop from 10 to 12-h.p. according to the speed. All the valves are mechanically actuated, the inlets being arranged on the opposite side to the exhaust valves. The engine is provided with an automatic governor as well as both hand and foot accelerators. The ignition is of the usual high tension type, by coil and accumulators; the water circulation is maintained by a friction-driven pump and a framed ribbed-pipe radiator with draught inducing fan. From the motor the power is conveyed through a leather faced friction clutch to the gear-box and thence by a cardan shaft and bevel gear to the rear live axle. The change-speed gear is of the sliding pinion type, giving three forward speeds and a reverse with direct drive on the top. The reverse motion is controlled by a separate lever. The brakes are of the internal expanding metal-to-metal type and the steering is controlled by worm and segment. The car is built as a two-seater, but is adapted to receive a detachable tonneau, so that four persons can be carried at a maximum speed of about twenty-eight miles per hour. The car weighs between 11 and 12 cwt., and has a wheel base of 6 ft. 6 in.

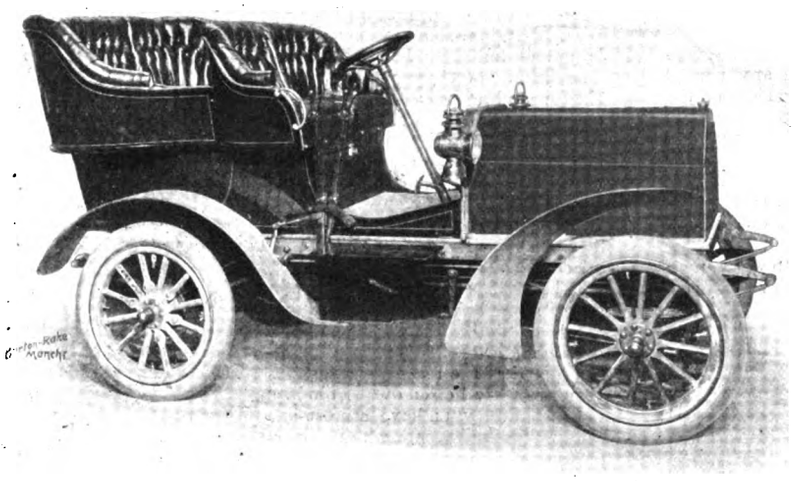

Fig. 7.—The "Horbick" 10-12-h.p. Three Cylinder Tonneau Car.

One of the 15-20-h.p. Horbick cars, with double-phaeton side entrance body mounted on a pressed steel frame is also shown. The engine comprises four cylinders, 90 mm. diameter by 105 mm. stroke, and develops 21-b.h.p. at a speed of 1,200 revolutions per minute. Both the inlets and exhausts are mechanically operated off a single cam shaft. The water cooling is effected by a friction-driven pump and a honeycomb radiator and fan. Three speeds and a reverse are controlled by one lever, the drive being through a leather-faced internal cone clutch and cardan shaft on to a live axle. The clutch is self-contained on its own shaft and operated by a pedal working on an inclined plane, no rocking shaft being necessary. The brakes are of the internal expanding metal-to-metal type, and those connected with the hubs of the rear road wheels are so arranged that the strain is carried by the frame and not by the springs, as usual. Throughout the car gives evidence of careful design and construction.

A new exhibitor is the firm of Messrs. C. A. Vandervell and Company whose excellent accumulators, however, have had a long trial among motorists. Electric headlights and portable lamps for inspection purposes are also shown.

Messrs. Kumitner and MacDonell have a display in which accumulators and accumulator accessories have a large space. Motor castings are another feature of a generally interesting exhibition. On the stand is a complete outfit for electrically lighting motor vehicles, including the headlight, side and tail lamps—and a roof lamp in the case of covered cars—all run from one accumulator battery.

The "Aquascutum" motor coat is well known as a stylish and serviceable garment for those who travel by automobile. This is made for ladies as well as gentlemen, and the detachable wool, silk, leather, or fur lining with which it can be supplied give it a distinctive character.

Messrs. J. G. Statter and Company make their usual excellent display of "De Luxe" jacks, headlights, side lamps, tail lamps. The jacks are among the handiest devices of the kind on the market.

Users of Pratt's motor spirit will find some points of interest at the stand of the Anglo-American Oil Company, where lubricating oils for machinery and cylinders as well as heaters for motor garages are on view.

Among the recent additions to the list of builders of heavy steam wagons is the Thames Engineering Works, Greenwich, who exhibit two different types of vehicles. The first is a 7-ton wagon fitted with a locomotive type boiler adapted to burn either coke or coal. The engine is of the enclosed compound horizontal type, having cylinders 4 in. and 7 in. diameter by 7 in. stroke. Two speeds are provided, the transmission being by steel geering, the differential gear being mounted on the main axle. The 4-ton wagon is quite a new departure in heavy steam vehicle design, more particularly as regards the transmission. As in the heavier wagon, the boiler is of the locomotive type; the horizontal compound engine, which has cylinders 3½ in. and 6 in. in diameter by 6 in. stroke, is placed at right angles to the usual position and drives the rear live axle through bevel gear. It will be interesting to watch whether the company find this arrangement gives satisfaction in actual practice, but in the meantime we may say that the workmanship is of the highest class. The Thames Engineering Works have also taken up the construction of petrol commercial vehicles, and show one designed to carry a load of from 20 to 25 cwt. It follows the general arrangement of chain-driven petrol cars, the motive power being supplied by a 12-h.p. double-cylinder engine, having mechanically-operated inlet valves and magneto ignition. Three speeds and a reverse are provided, the road wheels being shod with heavy solid rubber tyres. The steering pillar passes through the dashboard, the driver's foot board being reduced in width in order to allow the fitting of a very large body, so utilising, as far as possible, all the available space behind the dash.

Messrs. Alfred Dunhill, Limited, have a fine show thoroughly comprehensive of everything but the motor—to quote a phrase popularised by the firm. In motor clothing the selection is extensive, embracing leather garments, umbrella coats and capes, tweed motoring coats, knee aprons and rugs, fur motoring raiment, etc. Some special lines in servants' liveries are attracting much notice. The novelties include some of the devices lately described in the *Journal*, including dissolved acetylene, the musical horn, the Kennard valise, etc. To enumerate all the accessories ranged on this stand is a task prevented by consideration of space, but special mention may be made of a new indicator of simple yet ingenious construction whereby, should the tail lamp go out, the driver is notified of the same by a small electric lamp on the dashboard.

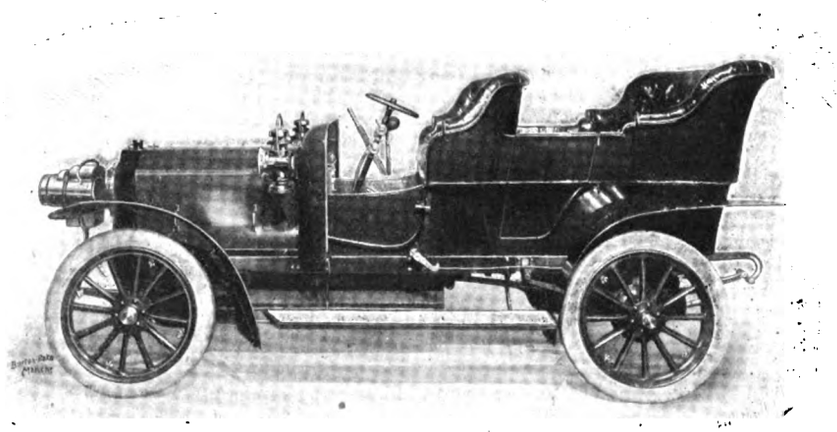

Fig. 8.—The "Horbick" 15-20-h.p. Side Entrance Double Phaeton.

Messrs. Thos. Smith and Sons, of Saltley, Limited, have an assortment of iron and steel stampings for motor-cars and motor-cycles. Motor tools are another department of their activity.

A capital exhibit of motor-cycle engines and accessories is made by Messrs. Leadbitter and Company. Veltmeters, plugs, cyclometers, goggles, electric lamps, horns, etc., are comprised in the display.

Messrs. Pumfrey and Company have a 3½-h.p. motor-bicycle with a duplex frame between which the tanks are fitted. The drive is by V belt and the saddle is suspended on a spring instead of a pillar. The long wheel base is a notable feature of the device.

Digitized by Google

From Tunbridge Wells comes Mr. H. ADAMS with his patent quick lift and short locked motor jack, designed for use in showrooms, garages and workshops. The front or back part of any car can be lifted bodily from the ground by tilting the jack towards the car, placing the claw under the axle and pulling the handle down. The car, being then raised, as the jack is on wheels, can be quickly transferred to any place in the garage without taking up any great space. In fact Mr. Adams is showing how a vehicle can with the aid of his jack be turned round in a space its own length. It certainly facilitates the easy manipulation of a vehicle, while, by allowing the leg under the handle to rest upon the floor, the car is placed in a firm position on the jack for repairing, overhauling, or cleaning. The idea is ingenious, and the way in which it has been carried out is highly creditable to the inventor.

A non-skidding band forms the exhibit of the WATKINS PATENTS SYNDICATE. This consists of springs, through which pass threaded stems fixed to plates on the edges of the band, and held in tension by winged nuts screwing up on the stems against the laminated springs. The attachment holds the band down tight on the tyre so as to prevent creeping, slipping, or friction between the band and the tyre, and any partial deflation of the tyre is taken up by the band under tension of the springs, so that the two are always in close contact.

The "Sampson" lamp of Messrs. GEORGE POLKEY, LIMITED, has been so recently described in our columns that it now remains but to be said that, whilst the lamp gives a central beam of light on the road, there is no alarming glare to anyone approaching. In addition to this acetylene head light the firm have paraffin head lights of good design and finish.

The OTTO BENNETT MOTOR COMPANY draw attention to their non-skidding leather bands and non-skids. These have been previously described in the *Journal*, and the accompanying illustration will recall their excellence to our readers. The Stepney motor wheel is also on view.

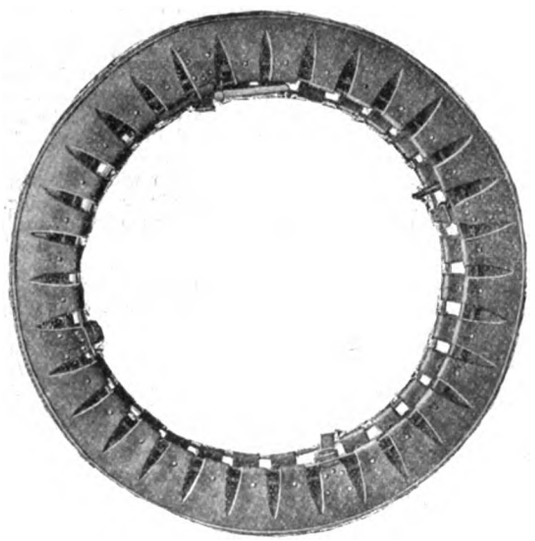

Fig. 9.—The Otto Benrett Detachable Non-skid Bard.

Non-skidding devices are numerous. The Eyre anti-skid consists of loops of twisted steel wire covered with a spirally-wound casing of hardened steel wire. These are secured to the spokes of the wheel by clips, and travel in a parallel line with the course of the wheel, so that when a side-slip occurs the wheel slides on to one of the loops, and the action is corrected. As the appliance does not encircle the tyre, the speed of the vehicle is not slackened by its use. The Samson non-skidding treads and tyres fitted to a Germain car are to be found on the stand of the SAMSON LEATHER TREADS AND TYRE COMPANY, LIMITED. These are universally known.

Moseley's beaded-edge motor tyre is a feature of Messrs. DAVID MOSELEY AND SON'S display. On this stand, too, is the Seddon red tubeless motor tyre which can be fitted to existing wheels by simply removing the rims and bolting the flanges to the felloes. There are no inner tubes.

Messrs. JESSE ELLIS AND COMPANY, LIMITED, exhibit one of their steam sanitary tip wagons and a lorry to carry four tons. The latter is one of the firm's latest design; it is driven by steel gear wheels, and is fitted with a special spring arrangement which adds greatly to the efficiency of the vehicle. Messrs. Ellis also display one of their steam vehicles fitted with an omnibus body. Messrs. WALLIS AND STEEVENS, LIMITED, show a couple of their useful miniature traction engines which come under the provisions of the Motor Car Act, and also a trolley designed to carry a load of four tons and provided with a special backing gear.

An interesting display of the latest type of Peugeot cars is made by Messrs. FRISWELL, LIMITED, ranging from the popular 5-h.p. Baby Peugeot to the *chassis* of a 28-32-h.p. car intended for Princess Said Toussoun. The 6½-h.p. car, which has been improved in many respects, has a frame of tubular construction. The engine is now provided with mechanically-operated valves, a single cam actuating the inlet as well as the exhaust valve by means of a series of componnd levers. No governor is provided, but the clutch pedal is so connected up to the throttle valve that when the clutch is withdrawn the speed of the engine is automatically decreased. The water circulation is maintained by a friction-driven pump in conjunction with a honeycomb radiator with fan. Three speeds forward and a reverse are provided, the top speed being direct on to the live axle. Quite a new model is to be seen in a 7-9-h.p. double-cylinder car with magneto ignition. Three forward speeds and a reverse are controlled by a single lever, the transmission being by bevel gear to a live axle. The clutch and brake pedals are of the push type, the accelerator, on the other hand, having to be pressed down. As an example of modern automobile construction the *chassis* of the 10-12-h.p. double-cylinder car is well worthy of inspection, a noticeable feature being the provision of separate exhaust pipes extending right to the silencer, for each cylinder. Of the four-cylinder cars, in addition to the 28-32-h.p. *chassis* already referred to, a 12-16-h.p. side entrance double phaeton, and a 12-16-h.p. five-seated landaulet built for Lady Beatrice Rawson are to be seen on the stand. The frames of these vehicles are of pressed steel. The motors have the four cylinders cast in two pairs, and all the valves mechanically actuated, the inlets being on one side and the exhausts on the other. Magneto-ignition is fitted. The largest type has also the high-tension system by coil and accumulator as a reserve. One of the most novel features in the new four-cylinder cars is the automatic carburettor, an illustrated description of which was given in a recent issue of the *Journal*. The arrangement is most ingenious, the air admission being not only automatically regulated but also the feed of petrol through the spraying nozzle. The change-speed gear-box is adapted to give four speeds and a reverse, and a noteworthy feature is the provision of a groove extending right round the edge of the lower half of the gear box. Oil is fed to this groove and is conveyed to the bearings by means of chain-ring lubricators. The brakes are of the metal-to-metal expanding type. Attention may also be drawn to the fact that the magneto, which is gear driven, is so arranged that it may instantly be removed from its place whenever necessary. Altogether Messrs. FRISWELL have a most interesting display, and with such a wide range of cars, appealing to motorists of all classes, there can be no doubt of these vehicles being as popular as ever in the coming season.

Messrs. H. E. HALL AND CO. have two stands, on one of which is shown a range of the latest models of Darracq cars, ranging from 8 to 15 h-p., the new features of which have already been dealt with in our pages. On a separate stand are a number of the Bergmann Lilliput two-seated cars, for which Messrs. Hall have secured the sole agency, and which, by reason of their moderate price, are likely to become very popular. The car is fitted with a 5-b-h-p. single-cylinder engine (80 mm. dia. by 100 mm. stroke), running at a speed of 1,200 revolutions per minute. High-tension magneto ignition is fitted, and the engine is controlled by throttle and advance spark levers, and the mixture can be varied by an air-pipe on the dashboard. The novel feature of the car is in the transmission, which is by patented friction drive, consisting of one power-giving and one power-transmitting disc, by means of which any desired rate of speed can be obtained, as also a reverse motion. The fly-wheel is made to serve as the power-giving disc; the receiving disc is mounted at right angles thereto on a shaft along which it can be moved so as to vary the point of contact. The gear is operated similarly to the ordinary petrol car, a pedal having to be depressed ere the disc can be moved by the usual change gear lever. From the disc shaft a single chain transmits the power to the rear live axle. The car can attain a speed of twenty miles per hour, and is stated to be capable of climbing gradients of 1 in 4 with two persons up.

Among the non-skidding and similar devices on view are the "Grose" puncture proof bands of Messrs. GROSE, LIMITED. The band is fitted with a steel-studded strip on the tread, a special point of the manufacture being that the leather is formed into the exact curve of the tyre for which it is intended, so that there is no detraction from the appearance of the tyre. Between the rubber tread of the tyre and the band is an intermediate strip of leather to protect the former from damage from the ends of the rivets.

Messrs. BOTIAUX AND COMPANY have a fine show of car bodies, including a side entrance double phaeton and a Berline touring car on a 20-h.p. *chassis*.

Messrs. CLEMENT-TALBOT, Limited, have a large stand, on which are shown a number of cars bearing their names, and ranging in power from 7-8-h.p. to 35-50-h.p. Principal interest is centred on the chassis of the latest type of 12-16-h.p. four-cylinder car. The engine has separate cylinders with the valves arranged on either sides; the latter are interchangeable, and the fittings are now so made that, if necessary, the cylinder can be turned round and the inlet valve side made the exhaust side, to equalise the wear, which is said to take place on the side on which the thrust of the piston falls when the explosion takes place. The point raised is a new one, and in view of the excellent results obtained from the usual type we are not inclined to think there is much in it. Other new departures in the car are the placing of the steering bar behind the front axle, a new compensating device for the rear brakes, and the raising of the frame at the rear end.

Messrs. T. J. HARMAN AND COMPANY, a new firm which has secured the British agency for the Vinot-Deguingand cars, exhibit several of these vehicles which enjoy an enviable reputation in France. The cars are

Digitized by Google

made in four sizes, 10-h.p., 14-h.p., 20-h.p., and 30-h.p., all with four-cylinder engines. Mechanically-operated inlet valves, on the opposite side to the exhaust, are adopted. The frames are of wood and steel or of pressed steel construction. The change-speed gear, which is of the *train balladeur* type, has been altered, and is now of the Mercedes type, the sliding sleeves, however, working on a hexagon shaft in place of the usual square type. The change-speed lever is on novel lines. By pressing a spring it operates at three different heights; in the highest position it gives two forward speeds, in the middle two more, whilst in the lowest it puts in the reverse gear. The transmission is by side chains from the differential shaft to the rear road wheels. The leather-faced cone clutch is of special construction; it is mounted on a spherical bearing, and is also provided with cushioning studs, which permit it to centre itself in the flywheel, even if, by reason of the frame being twisted, the clutch and crank shafts are not exactly in line. Another feature of the car is found in the special arrangement of friction control on the steering wheel. The 20-h.p. cars are provided with both accumulator and chain driven high tension magneto ignition, both being controlled by one switch and a single advance lever. The 10-h.p. car is on similar lines, but is fitted with accumulator ignition only. It may be added that the *chassis* are sufficiently long to receive side-entrance bodies.

At the stand of PRICE'S PATENT CANDLE COMPANY, LIMITED, will be found some novelties, including Belgraphine, a homogeneous mixture of Belmoline and graphite for restoring the surface of bearings in which "pitting" has occurred, and Cirogene for the internal lubrication of chains. Soaps for cleaning motor-car bodies are also brought to public notice.

Messrs. PETO AND RADFORD, LTD., have their usual good range of accumulators, sparking plugs, voltmeters, and electrical fittings for cars. An electrical rear lamp on this stand is worthy of particular attention from owners of automobiles.

The "OTTO BENNET" MOTOR COMPANY exhibit a number of the cars made by the Avon Motor Company. The three-wheel two-seated vehicle known as the Avon Trimobile has been considerably improved since we last inspected it, notably in the provision of compensating springs to the steering head. The 5-h.p. engine is arranged below the driver's seat, and is connected to a gear-box, giving three forward speeds, and a reverse, through a leather-faced clutch. From the gear-box a single chain transmits the power to the rear live axle. The engine is governed and is water cooled, a centrifugal pump being employed for the circulation. One of the Trimobiles is shown fitted with a van body capable of carrying a load of 5 cwt., and represents a type which has recently been successfully used in the Bristol postal service. The first of a new Avon four-wheel two-seated car is also exhibited, the vehicle having been introduced to meet the growing demand for a two-seater at a popular price. The frame is of tubular construction and the motive power is supplied by a 5-h.p. engine. The transmission is through a leather-faced clutch, gear-box giving three speeds and a reverse controlled from the steering column, cardan shaft and live axle. The pedals are of the push type, and, with a square bonnet and framed radiator, the little vehicle has altogether an attractive appearance.

Messrs. BITTON AND HARLEY give prominence to the Bi-car, a motor-bicycle fitted with a 3-h.p. Fafnir engine, transmission being by a V belt. The rider sits in a bucket seat, and the machine is started as though it were a car, footboards taking the place of pedals. It is claimed that the Bi-car, which has a free engine, absorbs all vibration, and that owing to the low centre of gravity sideslip is impossible. The appearance of the car is novel, and we await its performance on the road with some interest.

Autosternol, Occentoline, Sternoline lubricant, and similar specialities are to be found on the stand of the STERN-SONNEBORN OIL COMPANY, whose study of the requirements of motorists has given them a very satisfactory prominence in the trade. Purity is a characteristic feature of their productions, each of which has been prepared with proper regard to its use.

Clincher motor pneumatic tyres and motor clothing are exhibited by the NORTH BRITISH RUBBER COMPANY, LTD., and the CONTINENTAL CAOUTCHOUC AND GUTTAPERCHA COMPANY have a large selection of the various sizes of their motor tyres, including the square tread tyres.

LEE'S patent spiral non-slip tread is shown by Messrs. WRIGHT, METHUEN AND CO. This is a beaded tread in the form of a spiral working inwards so as to secure a thorough grip of the road when the car is running. It can be fitted to any make of tyre, and not only does it prevent side-slip, but is also claimed to prolong the life of the tyre.

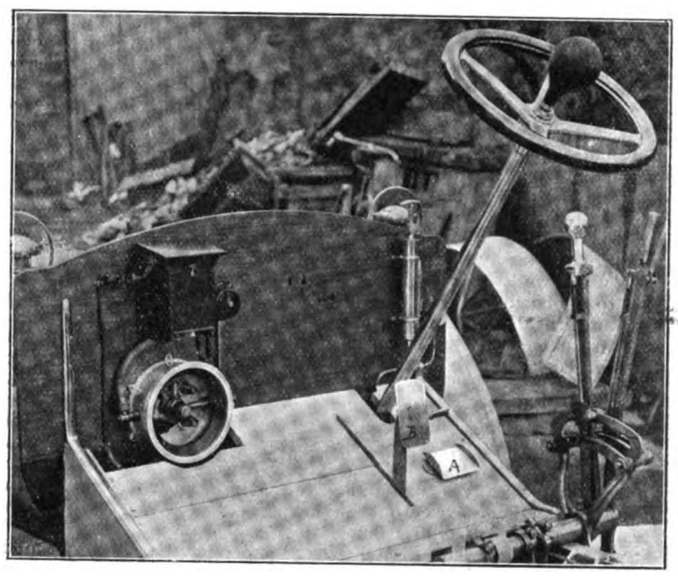
Messrs. BENZ AND CO., Mannheim, have a large stand, but the cars had not arrived at the time of our visit.

A RUMOUR is current in the Midlands that the Wolseley Company are about to introduce a 5-h.p. car, to meet the demand for a popular-priced vehicle.

DR. W. E. ST. LAWRENCE FINNY, an ex-mayor of Kingston-upon-Thames, who gave evidence at the Local Government Board inquiry against the proposal to introduce the ten-mile limit into that borough, has been made a Borough Justice of the Peace by the Lord Chancellor.

CORRESPONDENCE.

[*Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.*]



THE USE OF THE ACCELERATOR—HAND v. FOOT CONTROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the various criticisms on my article that appeared in your issue of December 10th last, I feel that the title you designated to this subject is hardly correct, as, if some of the correspondents had more carefully perused the same, I think they would have seen that my opinions and contentions were based upon a comparison between the new "Brotherhood" improved type of foot control, versus the existing popular types of control, whether they be hand or foot, or a combination of both. I was very pleased to note that evidently the majority of private motorists of experience were in accordance with my ideas, and at the same time was interested to read the criticisms of those who did not agree with me, and of course it is to the latter I feel the necessity more particularly of replying, while I thank the former for their kind support.

Taking the adverse criticisms generally, it can be summed up that the control they most favoured was a combination hand and foot control, arranged in the following manner:—

Two hand levers, fitted somewhere about the steering wheel or pillar, one for the advance or retard of the ignition, the other for varying the engine

View Showing Control Levers of "Brotherhood" Car.
A. Pedal Controlling Engine. B. Pedal Actuating Clutch and Brake.

speed in a gradual manner, or fixing it at a set required speed by means of controlling a governor on the engine, or a plain throttle, etc.

Three foot levers, actuated by either a push or downward movement; one for a coarse adjustment of engine speed, or, as it is commonly known, accelerating; the second for disconnecting the clutch; and the third for applying the foot brake.

As will be seen from the above, there are five levers in all without the addition of the steering wheel, change speed lever, brake lever and signal horn, making a total of nine appliances to be utilised in driving a motor-car with one pair of hands and one pair of feet. As the control of the "Brotherhood" car also comprises a steering wheel, change speed lever, hand brake lever and signal horn, the comparison lies between the first five attachments, which are the functions that are chiefly used in controlling a car when travelling, with, of course, the addition of the signal horn. Now as regards the control of the engine itself, the advocates of the combined hand and foot control admit the necessity of using these two methods to obtain the varying engine speeds required when driving a car, and consequently I think they will agree that, if a foot-control is so arranged to carry out the combined functions of both hand and foot-levers, it would be more convenient than the present system they advocate, as it would do away with the one hand lever for governor or throttle without increasing the number of foot levers. If, at the same time, the remaining hand lever for the advance and retard of the ignition could be done entirely away with, and the remaining two pedals replaced by one pedal only that could efficiently carry out all the functions required by throwing out the clutch and applying the foot-brakes, this would be still a further advantage, as in driving a car it would mean that when the engine was once running and the car in gear it could be started, the speed varied to any desired extent

Digitized by Google

and also the foot brakes applied by the simple means of two foot levers only. This would leave the hands perfectly free for steering, blowing the horn, changing gears, or applying the hand brake, which I contend is quite enough for one pair of hands to do.

This is exactly what I have carried out in the "Brotherhood" car in the following manner:—1st. The advance and retard of the ignition is automatic, being mechanically controlled by the motor itself in such a very fine degree that the ignition advances and retards as is necessary to obtain the finest running results from the engine at all speeds. The arrangement enables the period of firing to be varied to a much more constant and accurate degree than can ever be done by hand, and disposes of the ignition lever. 2nd. The engine on the "Brotherhood" car is not fitted with a governor, and is controlled entirely by varying the opening of the inlet valves. A foot lever working in a nearly horizontal plane with a sliding side movement operates this variable inlet gear, thus controlling the engine speeds to a very fine and constantly varying degree as may be desired or necessary. 3rd. The second foot lever undertakes the function of the usual two foot levers fitted for throwing out the clutch and applying the foot brakes. This is a push lever of the modern type as fitted to Mercedes cars, the first travel of which throws out the clutch, whilst the remainder of the travel applies the foot brakes. Only very slight movement is necessary for operating the first function, and at the end of this, by means of a simple cam connected to this lever, the resistance of the clutch spring against the same is released, so that the driver can feel immediately the clutch is out, so obviating any likelihood of partially putting on the foot brakes unless it is desired to do so.

As will be seen from the description of the foot lever controlling the engine, the method in which it works enables the finest graduation of motor speed to be obtained, and as it is actuated by a side movement of the foot, no amount of downward pressure will affect it; in consequence, the foot can lie naturally on this pedal, and can move it either way without any inconvenience, according to the desires of the driver.

I send you a photograph of the actual control itself, which is practically self-explanatory. It will also be noticed from the picture that yet another point has been improved in the "Brotherhood" control gear, and though only a small matter, is one that adds considerable convenience to the driving of a car. I refer to the bulb of the signal horn, which is fitted in the centre of the steering wheel, so that this always remains constantly in one position, and that the most convenient; the central steering tube is utilised to do away with the usual inconvenient length of flexible tube that is used, whilst the horn is carried in the front of the car, and connected to the bottom of the steering tube by flexible tubing which is out of sight underneath the bonnet.

With further reference to the contentions in my article that the new system of control enables the inexperienced driver to get the most efficient results, this is explained by the fact that all the important functions governing the perfect running of the motor (all of which in some cases, and only some in others, are usually left as part of the hand control, and require fairly constant adjustment to assure the best results), viz., the mixture, the timing of the ignition and lubrication, are mechanically and automatically regulated, and whilst the motor is running will always adjust themselves to the varying engine speeds without the necessity of attention from the driver.

Summing up the whole matter, what I claim for the "Brotherhood" is that: 1. It is considerably simpler than any other form; 2. There are no more control levers or attachments to manipulate at any one moment than can be conveniently done by one pair of hands and one pair of feet, without necessitating the changing of either over from one to another, thus minimising the possible risk of doing the wrong thing in cases of emergency or at any other time, and so reducing risk of accident, and assuring the control being more positive and perfect. 3. The convenience and simplicity of the system enables the flexibility of the engine to be taken advantage of more fully at all times, and under all circumstances. 4. The functions of the engine which require experience and fine adjustment to assure the efficient running of the motor being automatically controlled by the motor itself to a much finer and more constantly varying degree than can be carried out by hand, coupled with the simplicity and convenience of the control, enables the inexperienced as well as the experienced to get perfectly efficient running results from the engine.

In conclusion, I may say that perhaps it is well known I have been a practical automobilist since the inception of the industry in this country, during which period I have been constantly driving under all conditions, and leaving my own personal interest in the new system of control out of the question entirely, I can honestly say as a practical automobilist that the new method has only once to be tried to be appreciated, and I hope to be able at a very early date to give anyone interested an opportunity of testing it for themselves.

Thanking you for your courtesy in allowing me to publish my reply on this matter.—Yours truly,

PERCY RICHARDSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—This correspondence has been most interesting. As "an old hand" I entirely agree with Mr. S. F. Edge. A suitable governor ought to be fitted to every car, and the ignition made so that it could not be hastened beyond a certain point. This point to be fixed by maker of car and determined after a full test by expert. The governor to be set to give from one half to two-thirds of full power of engine. The accelerator pedal to be used for maximum. Hand control in addition, to be fitted to be used to slow engine when car is stationary, or, if powerful car, to set so that car can be run at any speed desired.

It is funny to read of an expert driver mistaking accelerator pedal for either his clutch or brake pedal. I have not met an individual of this type yet, else would strongly advise to give up driving. A good combination is that of clutch and brake pedal. A still better, to my thinking, would be that of clutch, governor or accelerator, and brake; withdrawing clutch would bring governor into play, and, pressing home, would apply brake. It would not be difficult to devise such an arrangement.—Yours truly,

G. G.

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The two letters on this subject in the *Journal* of January 21st only confirm the opinions and experience of every qualified electrician. No known form of primary battery can be satisfactorily used to charge accumulators. The cost of the charge for the primary batteries of the best design and construction, and specially made for the best possible economy of material, is such that the unit of electricity they supply is ten times the cost of a unit supplied by electricity supply works. The volts rapidly fall off when charging accumulators over any length of time. The labour of cleaning out and re-charging a primary battery is considerable, and a messy job at the best. If motorists would consult any reputable electrical engineer, they would be warned against the attempts to use primary cells for the purpose of charging accumulators for motor-cars or motor-boats. If accumulators cannot be sent out to be charged properly from an electricity supply, or dynamo, they should not be used at all. A small magneto driven off the engine will do the work of the accumulator, and requires no attention, and will work with the common trembler coil and sparking plug. We exchanged an accumulator for a magneto in a motor-boat and have had no trouble since, and neither the wipe contact nor the coil, nor the plug required any alteration whatever when the change was made.—Yours truly,

ELECTRICAL ENGINEER.

THE GRAPHITIC LUBRICATION OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In further supplement to my previous letter, and in reply to the Glasgow Motor Tyre Company, it is evident this company did not read the article to which my letter was a reply. In this the writer advocated the injection of graphite by means of sparking plug holes, and that, too, in fair quantity. Now, as graphite is a high conductor of electricity, and seeing oil, and even graphite, although only introduced by way of the base chamber, will work up into combustion head and so foul the plugs, it is only "asking for trouble" to use it. I therefore deny that it can be satisfactorily used for lubrication of motors using electric ignition. But, as advocated in my letter, it is an excellent addition to the usual lubricants used in gear cases and other parts. But pure graphite must be used.

It was a hardened combination of oil and graphite which destroyed my plugs. I am fully aware of the almost indestructibility of graphite by heat. The graphite I used was Dixon's, which is beyond reproach. I am not interested in the sale of any lubricant. It would be interesting to know the ignition systems and plugs used by the Glasgow Tyre Company and by "Old Subscriber."—Yours truly,

GEORGE GIBSON.

A CHEAP MOTOR FUEL WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is remarkable that, despite the many attempts to popularise alcohol as a motive power, and the many strong points which have been recorded in its favour, so little success has attended the movement. Every motorist would welcome a fluid which promised to be cheaper, safer, and as effective as petrol, and these claims have been advanced for alcohol. Moreover, the latter is an artificial substance easily manufactured in almost every clime, whilst our petrol supplies are drawn from a few natural sources and are so limited that a "corner" could be worked in it without much difficulty.

This is a condition of things which is certainly not desirable. A growing industry like automobilism should not be wholly dependent on what may be described as a rare product. A new and cheap fuel with all the good qualities of petrol would advance motoring considerably. Alcohol, though so far an apparent failure, has many points of recommendation for experimenters. It can be cheaply manufactured in our own country from many forms of agricultural produce. If the British farmer found a demand for such stuff he would take a kindlier interest in automobilism. Alcohol distilleries would spring up all over the country, and considerable employment be given in growing, collecting, preparing, and extracting spirit from the various field stuffs, etc., adapted for that purpose. The complete applicability of alcohol to motoring may be chimerical, and consequently all our fond dreams of new home industries created by

Digitized by Google

motoring may have to be abandoned. But, failing alcohol, perhaps some clever chemist may devise a new hydro-carbon which will be cheap, easy to produce, and powerful in use. Should such not be forthcoming immediately, it may at least be hoped that more attention will be given to the heavy oils. A few firms have enterprisingly studied the matter, and with no inconsiderable success. The ideal has, however, not yet been reached. When motorists can command a cheap, universally distributed, compact, and safe fuel, many of the woes which befall us at present will have disappeared.—Yours truly,

T. W. DEWHURST.

COLD WEATHER PRECAUTIONS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I read "C. D.'s" letter in the last issue of the *Journal*, and, thinking they may be of interest, I send you my experiences of anti-freezing preparations. First of all I tried glycerine, but it did not satisfy me. In the first place it is expensive, for while it does not evaporate very quickly, it deteriorates, and in a short time you must clean out your tanks and pipes and put in a new supply of both water and glycerine. For this reason I have given the preference to calcium chloride, and got good results from it until this year, when I met with a very peculiar experience. It is my custom to buy the necessary ingredients and prepare the mixture myself. I put four pounds of the salts to each gallon of water, and as the tank of my car holds four gallons, there were sixteen pounds of the salts in the cooling apparatus. Everything went well until one day my pump got out of order and the liquid ceased to circulate. Consequently the water got hot, boiled, and finally evaporated—all without my noticing that anything was wrong until it was all gone. Unfortunately, as I discovered shortly, only the water had evaporated. The salts were still there. They had caked in the bottom of the pipes and were as hard as rock. Nothing I could do would get the deposit out, short of taking a cold chisel and hammer and cutting it out. That is what we had to do, and it took many long hours. I am now looking out for a better anti-freezing medium and should be glad to know if any motorist has tested the wood alcohol referred to in a recent issue of the *Journal*.—Yours truly,

R. L. S.

AN INTERESTING MOTOR QUERY.

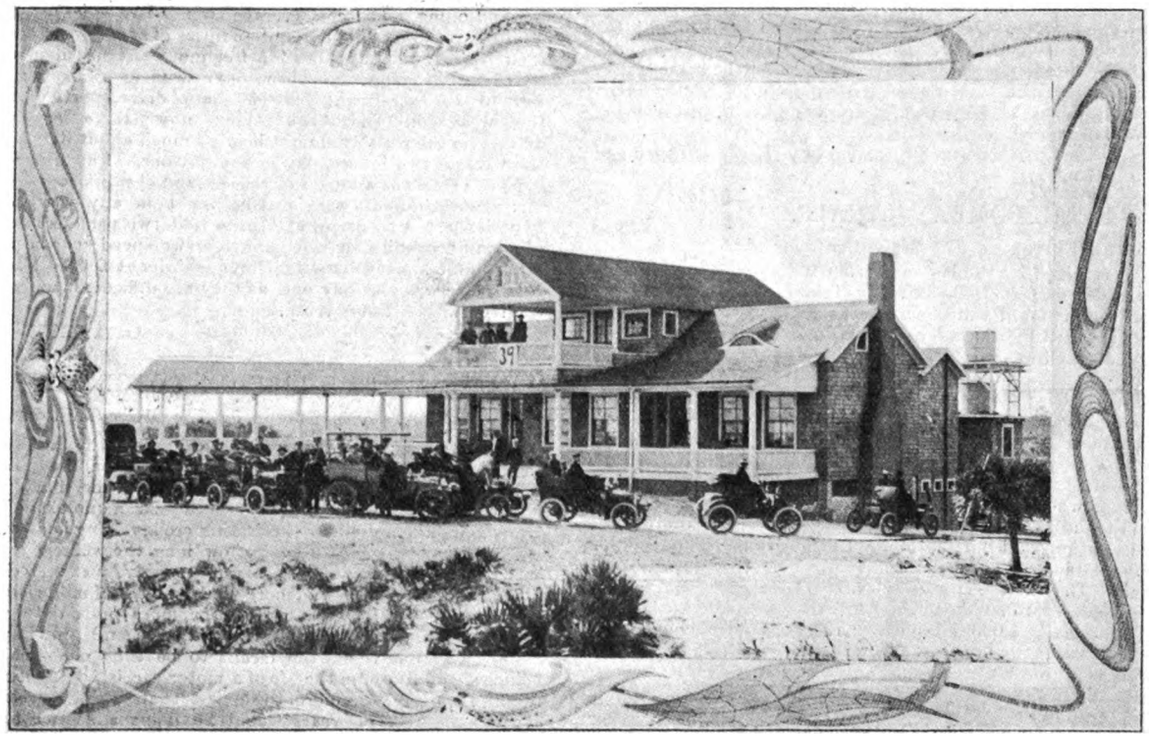
TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—As no one has offered to answer the query raised by Mr. Fortune and other gentlemen *re* the increase of power devoloped by their motors whilst being driven in the evening, I shall be obliged if you will kindly allow me space in your valuable columns to attempt to clear up the mystery.

It is fashionable at the present time for motor manufacturers to use some method or process by which they heat up the air before being drawn through the carburettor into the engine. Their intention is doubtless to prevent the carburettor from freezing up, etc. This to my mind is more fashionable than correct. In the first place the gas or explosive mixture is admitted into the engine in a more or less expanded condition, and naturally one cannot expect that charge to be as large or cause as much compression on the upstroke of the piston as could be derived from a charge that is drawn in perfectly cold. To my mind a charge that is drawn into the engine in a perfectly cold state is not only much larger, but as the valve closes the instant the charge is in, it is expanded inside the cylinder instead of outside, and to a certain extent it is compressed by the heat extracted from the cylinder walls and without the aid of the piston on the compression stroke.

If Mr. Fortune will connect another pipe to the carburettor or fit a cut out, similar to an exhaust cut out, with a suitable regulating apparatus (twin tap, slide or trap door) to the pipe on his carburettor he will discover that the more cold and the less hot air he permits to be admitted into his engine, the more power will the engine develop and the cooler it will keep. He will also find that his car travels as fast in the daytime as at night. Let Mr. Fortune heat up his petrol if he likes, but he should keep the air that he supplies to his engine cold.—Yours truly,

RICHARD HODGSON.



LUBRICATION OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In reply to queries from other readers as to the use of graphite in car engines, I have been using Dixon's No. 635 special graphite for the past nine months in the axles, differential, gear-box and engine of a 10-h.p. Argyll car with satisfactory results. For axle bearings and differential I mix it with Price's Belmoline C. and Motorine C. in the proportion of 2 lbs. of graphite, 5 lbs. of Belmoline, and 1 pint of Moterine.

For the gear-box I generally put two heaped tablespoonfuls into the box after cleaning it and filling with gear oil (about every 300 miles). I wash engine out with paraffin every 100 or 120 miles and put a tablespoonful of graphite into the crank case with the lubricating oil. I have no trouble with the graphite in the cylinders.—Yours truly,

M. A. ROBINSON.

The Automobile Club House on the Ormond-Daytona Beach, Florida.

AN ENQUIRY FROM SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should feel greatly obliged if you would allow me to draw the attention of manufacturers and agents of motor-vehicles and accessories to the fact that I should like to be supplied with their new catalogues. It is almost impossible to write to them all from here, and there are so many new makers putting goods on the market now.

I am particularly in want of a good strong make of car able to carry about eight persons and ten or fifteen hundredweight of luggage, and able to average a speed of about fifteen miles per hour on roads, a good portion of which have two or three inches of sand and some fairly stiff gradients. The top speed on the flat does not require to be high, but the gearing

Digitized by Google

should be such that the car would be capable of climbing a decent hill at a fairly decent pace; it should also have from fifteen to eighteen inch clearance underneath, the roads out here being very indifferent.—Yours truly,

J. ALLANSON.

Stamford Hill Road, Durban, South Africa.

BOX SPANNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from Mr. Kennard reminds me of what I saw the other day. It was a small box containing about two dozen wrought iron sockets to fit exactly any nut from ¼ inch upwards. In addition there was a ratchet arrangement, so that in difficult places where it was not possible to get a complete turn, the ratchet could be used. There was also a swivel joint, by which nuts in the most inaccessible hole or corner could be adjusted by working the spanner on the skew.—Yours truly,

R. C.

THE WAGES OF DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "J. B.'s" letter in the 28th inst. issue of your *Journal*, I should advise J. B. to keep the situation he has now got, as there is no demand for tuition-drivers unless they care to work from six o'clock in the morning until twelve o'clock at night, and do all the house work, gardening, and look after the horses, and work for about £1 per week and keep themselves. When a man has tuition he is taught to drive on a very old type car generally with tube ignition. A man cannot expect to learn a trade in one month and go out and claim the same wage as a mechanic. At the present time there are hundreds of young men who have left good berths to be motor drivers and are in just such a state as "J. B."—Yours truly,

SYDNEY R. HARBERT.

DELHI-BOMBAY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have received by the last mail from India several communications dealing with the recent Delhi-Bombay Trials, and enclose some extracts herewith, from which it will be noted that a great deal of dissatisfaction has been caused by the judges' awards and a protest signed by the majority of competitors has been made to the Western Union. Fortunately this dissatisfaction has found public expression in the Indian Press, and those cars which were conspicuous for good performances have thus received in some measure their due rewards. At the same time it cannot be too strongly urged on the promoters of these competitions that the bare suggestion of prejudice in the matter of awards will effectually prevent the possibility of holding future trials.

One of our friends who took an active part in the run writes us from Bombay. "When the judges' decision and awards were published there was the most intense irritation and indignation. I had a consultation with Mr. —— and Mr. —— and told them straight to refuse the consolation prize offered them." They acted on my advice, and I feel sure your company would not be pleased to have one of their cars given a consolation prize when it had run nearly 1,000 miles under the most strenuous conditions and come in without loss of any marks. Some particulars as to the team running of the three Wolseleys may interest you.

Mr. Vakil's	.. ..	8 non-stops.
Capt. Muter's	.. ..	4 ,, ,,
Lieut. Skelton's	.. ..	5 ,, ,,
Total	.. ..	17 out of a possible 24.

A far higher average than any other team obtained. Now please bear in mind that in England you have never had trials like these over all sorts and conditions of roads, good, bad, and very bad. The test was most severe, as is shown by the fact that only twenty cars out of thirty-eight finished at all."

The owner of the Wolseley car which made the eight non-stop runs sends a number of press cuttings expressing in very high terms the qualities of the car and the manner in which it performed the journey. Another letter says, "There is unanimity of opinion that we have been hardly dealt with by the judges," the judges having awarded us a consolation prize which we did not deserve.

We think that the foregoing extracts are sufficient to prove that the officials responsible for the awards in these trials were not selected with a due regard to their knowledge in motor matters, and we think you will agree that this is to be very much regretted, especially in view of the excellent arrangement which appears to have been made for the conduct of the trials.—Yours truly,

THE WOLSELEY TOOL AND MOTOR-CAR COMPANY, LTD.

TRI-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Beginner," a recital of my experience with a tri-car, which has extended to 14,000 miles, on a belt-driven, single-geared, air-cooled machine, and 16,000 odd miles on last year's pattern Rexette, two speeds, water-cooled and chain drive, may be of interest. Speaking in general terms, I have found this type to be reliable, handy, economical, and easy and safe to ride. I say this even in spite of a misleading article that has recently appeared in a contemporary journal. The statement of the author of the article in question that a tri-car is difficult to steer must come as a surprise to the practical user, and can only be accounted for by a singular want of skill on his part, or that the particular machine he rode was out of order. During my tri-car days I have never had an accident of any sort, and most of my time is spent in threading my way through the crowded streets of a large Midland city in the pursuit of my professional duties—under all conditions of traffic and of weather.

I consider the belt-driven, air-cooled, single-geared, and cycle-seated machine a mere makeshift, and only suitable for a young enthusiast who would be prepared to put up with a great deal of inconvenience, such as belt repairs and cost of renewals, pushing off to start (pedalling quite impossible), violent pedalling on hills when a passenger is carried (this is usually described as light exercise, conducive to health, etc., by the vendor), minor troubles, as being covered from head to foot with mud thrown from the belt, which always has to be placed near the ground. These, and other troubles of a lesser nature, made me part with my machine with the proverbial sigh of relief.

My next venture was last year's pattern Rexette, free engine, chain-driven, water-cooled, two speeds and bucket seats. This combination seemed to end all my difficulties. The chain has never given any trouble, except coming off occasionally from want of proper attention. The clutch and gear-box and engine I look upon as never requiring any special attention except cleaning and oiling, and I can average twenty-five miles per hour on our Midland roads. The hill-climbing qualities of two-speed tri-cars seem all that are required, and the vibration I cannot specialise upon as I do not notice it; the water cooling has been above suspicion. Last year the Press was full of the disadvantages of chain drive, particularly in relation to the wear on the back tyre; now there are plenty of chain drivers on the road we do not hear so much about it. My tri-car now does the work of two horses, day in and day out. I am quite satisfied with this type of vehicle as a means of reliable and cheap locomotion. The letter of Mr. Saunders in last week's issue is not in any way consistent with my experience. A tri-car of 3½-h.p. to take two persons must be geared very low and consequently slow, unless a two-speed gear be used. What does Mr. Saunders mean by a light four-wheeler at £80? If a quad, it will be hardly necessary to buy one, as they are difficult machines at present even to give away.—Yours truly,

G. PERCEVAL ADAMSON.

THE LIFE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is now just over eight years since the Act of 1896, by which the red flag was abolished, came into operation, and as the number of cars in use has been steadily increasing since that time, much information must now be available as to the life of a motor-car, a question of great interest to many who, like myself, are hesitating ere investing in an automobile until it is possible to get some idea as to how long the vehicle is likely to last in actual service, or how long it may reasonably be expected to be capable of doing efficient work. The more wealthy class of motorists are able to dispose of their cars in order to go in for more up-to date vehicles, as these make their appearance; but there is a large and growing section of automobilists who have not the means to be thus continually changing their vehicles, and to whom the life of a motor-car is consequently a vital question. I venture, therefore, to suggest that any motorist who has had his car for a number of years would be doing a service to many would-be owners by sending an account of his experience in the way of cost of upkeep, etc.—Yours truly,

F. D. P.

A DOCTOR'S EXPERIENCE OF MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been motoring now for nearly five years in my professional work, and greatly prefer motors to horseflesh. I started with a 3½-h.p. Benz, which served me well for eighteen months. I then became more ambitious and went in for an 8-h.p. M.M.C. which gave me another eighteen months' complete satisfaction. I am now in possession of a Vulcan 10-h.p. two-cylinder car, which has given me unqualified satisfaction, and I can genuinely recommend a car of this type to any of my brother medicos. It is not too big a car and is a grand hill-climber. I received my car last June, and have been running daily ever since without a single visit to the repair shed. I have worn out two pairs of outer covers (Michelin) in the time, which fact alone, I think, speaks volumes for the running of the vehicle. I find my car far cheaper than horses, and now that motor landaulets and broughams are coming so much to the front, I can see no advantage at all for the horse-drawn vehicle even in bad weather.—Yours truly,

EDWARD JAMES DECK.

WAGES OF DRIVERS.—Several correspondents have written in reply to "J. B.'s" letter of last week confirming his reference to the low rates of pay offered to drivers of motor-cars.

CLUBS AND ASSOCIATIONS.

LIVERPOOL UNIVERSITY.

At a well-attended meeting in the engineering department of the University, it has been decided to form a University of Liverpool Motor Club. Ordinary membership is open to present and past students, two classes being formed—for riding and non-riding members. Other persons interested may join the club as honorary members. Rules were drawn up and the following officers elected:—President, Mr. J. A. Brodie; vice-presidents, Mr. E. Brown, Dr. Grindley, and Mr. G. Worrall; treasurer, Mr. J. Okill; secretaries, Mr. H. L. Burd and Mr. J. A. Mackie; captain, Mr. J. C. Hall; sub-captain, Mr. Stillman.

HERTFORDSHIRE.

The Hertfordshire Automobile Club held its first general meeting at the Café Monico, London, on Saturday. Mr. N. B. Kenealy presided. The hon. sec. (Mr. W. Whittall), in submitting the annual report, referred to the meets held by the Club, and to the two hill-climbing events. The Aston Hill climb marked a new departure in contests of this description, inasmuch as it originated the rule whereby steam cars were permitted to run at the foot of the hill and so "warm up," thus approaching ordinary touring conditions. The gentlemen who held office during the preceding year were re-elected. The Committee is as follows:—Dr. Gruggen, Messrs. A. Hunt, W. G. James, C. Wood, E. Kenealy, E. T. Pryor. The offices of hon. treasurer and hon. secretary have been combined, and Mr. W. Whittall was elected to the joint post. The accounts showed a balance in favour of the club of £26. A dinner was held after the meeting, at which the prizes were presented to the winners of the hill-climbing events, Mr. A. Hunt receiving a silver cigarette case as the winner of the motor-cycle hill-climb, and Mr. F. Coleman received a silver-gilt claret jug for winning the Aston Open hill-climb on a 10-h.p. White steam car.

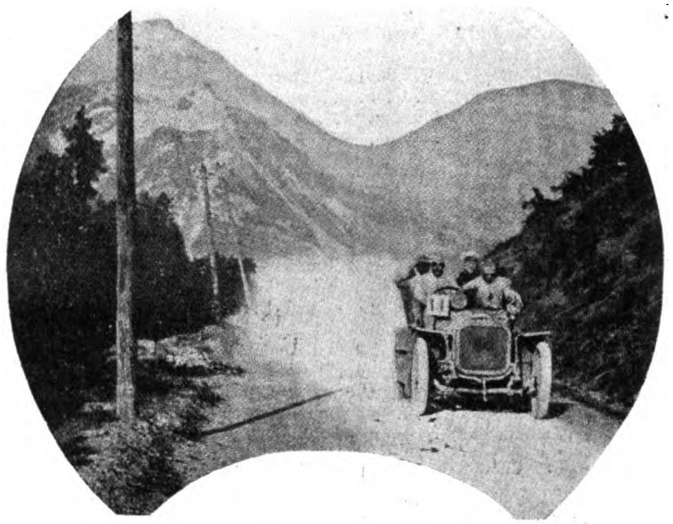
SUSSEX.

At the Old Ship Hotel, Brighton, a largely attended meeting of Sussex motorists was held on Saturday with a view to the formation of an automobile club for Sussex. Colonel Holden presided at the commencement of the proceedings, and, having spoken encouragingly of the idea, vacated the chair in favour of Mr. W. James, of West Dean Park, Chichester.

Earl Russell moved that, in the opinion of this meeting of Sussex automobilists, a strong County Automobile Club should be formed for Sussex for the purpose of the encouragement, protection, and development of the automobile movement within the county, and to act in conjunction with clubs and organisations having similar objects. The motion was seconded and carried unanimously, the Committee being elected as follows:—Messrs. J. Amps (Uckfield), B. Y. Bevan (Brighton), C. E. Collins (East Grinstead), J. P. Cockerell, J.P. (Eastbourne), Sir James Duke (Laughton), Messrs. A. Scruse Dickens (Horsham), H. S. W. Eyre (St. Leonards), C. F. Frowd (Hastings), Sidney Farrer (Brighton), Captain J. G. R. Homfray (Hove), Messrs. W. James, J.P. (Chichester), J. Godwin King (East Grinstead), Captain F. D. Lyon (Brighton), Messrs. Boyle Lawrence (Bognor), C. J. Lucas, J.P. (Warnham Court, Horsham), E. G. Miller (Brighton), M. F. Mieville (Chichester), G. W. Osborn, J.P. (Heathfield), Major Pierson, J.P. (Worthing), Earl Russell (Chichester), Captain Gerald Spencer (Ringmer), Mr. A. M. Singer (Hove), Major R. C. Turner (Brighton), and Mr. W. L. Wallis (Eastbourne).

On the motion of Mr. Wallis, seconded by Earl Russell, it was agreed that the committee elect members, appoint officers, and take all necessary steps to complete the formation of the club, and it was further resolved that the club apply for affiliation with the A.C.G.B.I., including membership of the Motor Union.

Mr. C. F. Frowd moved that the annual subscription be two guineas per member per annum, and this was agreed to. Mr. Frowd also proposed that an entrance fee be charged after a certain date, and it was decided, on the suggestion of Earl Russell, that it be an instruction to the committee to fix an entrance fee for all joining after May 1st. Replying to questions the Chairman said it was not proposed to limit the membership to motor owners; that the idea was to have Brighton as the working centre of the Club, with sub-centres all over the county; details would be worked out by the committee; that the question of including lady members had better be left to the committee; and that, pending the appointment of a secretary, communications could be addressed to the committee at the Old Ship Hotel, Brighton.



In moving that "this meeting of Sussex automobilists is of opinion that the proposal of the West Sussex County Council to close Middle Street, Horsham, to motor-cars is not required in the interests of the safety of the public, but that the closing of such a street might lead to accidents," the Chairman said that in order to avoid this street, motor-cars would have to make three or four right-angled turns, which was much more dangerous than going through the street in question. Furthermore, if they agreed to the closing of this street it would seem to indicate that motors were more dangerous than other vehicles, whereas they contended that they were much safer, being under much better control. He did not believe the Local Government Board were at all anxious to close any roads; and he thought a strong representation would achieve their object.

Earl Russell thought it would be a very good idea to have some good bold signs calling attention to the place, and remarked that there seemed to be an almost total absence of guide-posts and signs in towns, so that strangers had to find their way as best they could. The motion was carried unanimously, and it was further decided that a copy of the resolution and a formal notice of objection be sent to the Local Government Board and to the County Council.

On the motion of the chairman, a hearty vote of thanks was accorded the proprietors of the Old Ship Hotel for their courtesy in placing rooms and garage accommodation at the disposal of the Union for the meeting. Mr. Moore then moved a vote of thanks to the Committee of the Motor Union for the trouble they had taken in forming the Club. This was carried unanimously, and in returning thanks Colonel Holden pointed out that one of the objects of automobilists must be to fight against the introduction into Parliament of any measures likely to impose any further restrictions upon them. A hearty vote of thanks to the Chairman concluded the meeting.

THE SOUTHERN CLUB.

A most successful opening of the new headquarters of the Southern Motor Club took place on Thursday of last week. Members and friends filled the big room of the premises to hear a lantern lecture on Marine Motoring by Mr. A. F. Evans, A.M.I.E.E. The concert following Mr. Evans' lecture was a thorough success. Excellent songs were sung by, amongst others, Messrs. H. Church, A. Vickers, H. Billing, W. Dent, C. E. Bygrave, and A. E. Edwards. The lantern, which was lent and operated by Mr. Allen Vickers, was also called in to vary the proceedings, some fine slides of club members and others of general interest, lent by Messrs. H. Jones, C. E. Bygrave, F. C. Patterson, Shapnell Smith, and Rees Jefferys, causing much applause. In acknowleging the vote of thanks proposed by Mr. F. Catling, and rendered with musical honours, the Chairman said he thought the new headquarters were a great improvement. Such pleasant and instructive evenings as the one they had enjoyed would certainly induce a large number of motorists to join the Southern Motor Club.

Touring in the Alps.

MANCHESTER.

The annual general meeting of the Manchester Automobile Club was held at the Midland Hotel, Manchester, last week. The hon. secretary, Mr. J. Hoyle Smith, in submitting his report, said that the club now numbered just under 200 members. During the year protests had been sent to the Local Government Board against granting a ten mile limit to Blackpool, Mossley, Stockport, Todmorden, and Leigh, and members of the club had attended as witnesses at the enquiries held at Todmorden, Leigh, and Bury. In two cases only had members of the Club been summoned for infringement of the Motor Car Act.

A good deal of correspondence had taken place during the past year with the Cheshire and Lancashire County Councils respecting their bye-laws on the lighting of vehicles at night, asking if these could not be altered, so that the carrying of a rear light should be universal, and not confined simply to motor-cars and those vehicles carrying loads which projected six feet or more behind the car.

The hon. treasurer, Mr. S. Okell, proved by his report that the finances of the Club were in a thoroughly satisfactory state.

Mr. Frederic Smith, who has occupied the chair for the last two years, proposed that the President for 1905 should be Mr. T. W. Grace, and this proposal was unanimously assented to by the members present. Mr. F. Smith was elected a Vice-President, as was also Mr. S. Okell, who had to

Digitized by Google

give up his treasurership owing to his intention to go abroad this year. The Committee were then elected, the other officers for the year being as follows:—Hon. Treasurer, Mr. F. R. Hesse; Hon. Secretary, Mr. J. Hoyle Smith; Committee:—Messrs. T. W. Grace, F. R. Hesse, G. Higginbotham, A. E. Jones, N. Kilvert, H. W. Lee, J. A. Morris, D. Moseley, V. F. O'Neill, L. G. Schwabe, F. Smith, and J. Whitehead.

Mr. T. W. Grace, the new President, said that it was the intention of the committee to approach the Cheshire and Lancashire County Councils to see if some arrangements could be come to between them and the club re the placing of notice boards at sharp corners and dangerous places on the road, as they think this matter is one of great importance and that the practical experience of motorists would be of great service to the County Councils in the selection of corners which really were dangerous.

The proceedings terminated after a vote of thanks to the retiring officials. The annual dinner will be held at the Midland Hotel, Manchester, on the 8th inst.

BLACKHEATH.

The Blackheath Automobile Club gave its first annual dance at the Concert Hall, Blackheath, on Saturday last. It proved most successful, nearly 180 members and friends being present. A large increase to the ranks of membership is anticipated this year, and local motorists who propose joining should forward their names at an early date to the hon. sec., Mr. Alfred Roberts, of Madgelands, Beaconsfield Road, Blackheath, S.E.

YORKSHIRE.

The annual general meeting of the members of the Yorkshire Automobile Club was held last week at the Great Northern Hotel, Leeds, Mr. E. H. Hepper presiding. The balance-sheet showed a balance in hand of £115 12s. 11½d.

In giving an outline of the programme that would probably be arranged by the committee during the forthcoming season, the Chairman said that a valuable trophy had been given by Mr. Leng, of Sheffield, for speed, and it was proposed that the contest should take place on Filey Sands, on a date yet to be decided upon. They also intended to hold another hill-climbing contest at Pot Bank, near Harrogate, or some other hill suitable for the purpose. It was also intended, if they could obtain the permission of Earl Fitzwilliam, to have a speed trial at Wentworth Woodhouse.

The following officers were elected:—President, Earl Fitzwilliam; vice-presidents, Messrs. A. M. Bosville (Bridlington), W. H. Thornton (Birkenshaw), B. Bagshaw (Leeds), W. Penrose (Leeds), and H. R. Kirk (Leeds); hon. secretary, Mr. C. P. Wilson (Leeds); hon. treasurer, Mr. L. Hey (Leeds); hon. solicitor, Mr. A. Masser (Leeds); committee, Messrs. A. H. Marriner (Keighley), A. W, Roslington (Leeds), T. Whitaker (Horsforth) A. W. Dougill (Leeds), E. Faiers (Bradford), H. A. Jones (Bradford), R. Winn (Leeds), E. H. Hepper (Leeds), W. Jackson (Bradford), H. A. Johnson (Harrogate), W. Tempest (Leeds), A. Exley (Leeds), and Dr. S. Rumboll (Leeds).

During a general discussion that followed, Mr. Jones suggested that a camp should be held at Filey at Whitsuntide, from Friday to Tuesday. Then the trials could take place on the Saturday and Monday. The camp should be self-supporting, and not come out of the club funds. The speaker also incidentally stated that the three hundred cars owned by members of the club represented the value of £60,000.

Six new members were elected, including Mr. R. E. Fox (the Town Clerk of Leeds), who conducted the Corporation's case at the recent speed limit inquiry, and Alderman A. Currer Briggs. The Lord Mayor of Leeds (Mr. R. Armitage) was also appointed a member.

NOTTINGHAM.

Members of the Nottinghamshire Automobile Club mustered numerically strong at the fifth annual meeting at the Black Boy Hotel, Nottingham. The report described the work done in the past year, and from a sporting point of view characterised the competitions as having been most successful, and looked forward to future events with pleasurable anticipation, another challenge trophy having been offered by Mr. Wilson. During the season the club had been invaded for the first time by the admission of lady members, Miss Starkey, of Southwell, having been elected, and since then another had followed suit. Automobilists were pre-eminently a law-abiding body. There had been no prosecutions for any infringements of the law either in the city or county in which the club had been called upon to defend. A case taken up by the Motor Union was an appeal by Mr. R. S. Clifford, jun., of Loughborough. The appeal was fortunately successful, and, although it cost the Motor Union a large amount of money, the Automobile Club in London and the Motor Union thought that the importance of the matter fully justified the expenditure. Another case was that in which one of their members, Dr. Gass, brought an action against the Burton Corporation. The action was successful, the claim and all costs being allowed. Another case was that of Mr. Belcher, which occurred in another part of the country where the police methods were not so sound and good as in their own district. The club had placed a signboard at each end of the village of East Stoke on the way to Newark, owing to representations made as to fast driving through the village, warning motorists that it was necessary to observe caution. The statement of accounts showed that in 1904 the receipts amounted to £212 18s. 6d., and the expenditure to £152 9s. 11d. At the present time there was a balance of £121 11s. 6d. The report and balance-sheet having been adopted, Mr. Charles Hardy was re-elected president and Messrs. Wells, Kirk, and Cowen vice-presidents. Mr. Booth Granger was elected hon. secretary and treasurer. Messrs. C. Hardy, A. R. Atkey, and B. Granger were appointed to represent the club on the Motor Union, and Messrs. Stevens and Bircumshaw were elected auditors. Mr. J. J. Spencer was made a member of the club. Messrs. R. Harbidge, H. Belcher, R. Cripps, S. Harvey, B. W. Winter, W. D. Wells, M. R. Browne, D. Foster, W. Foster, and H. Rimington were elected as the committee for the ensuing year.

THE MOTOR REGULATIONS IN ROYAL PARKS.

At the Marlborough Street Police Court on Friday of last week, Augustus Locke, of College Street, Chelsea, was summoned, before Mr. Kennedy, for driving a motor-car at a greater speed than ten miles an hour in Hyde Park on January 6th.

Mr. Staplee Firth, solicitor, who appeared for the defence, said he did not dispute that the defendant was going more than ten miles an hour, but raised the point that the fixing of a ten-mile speed limit in the park rules was illegal.

Inspector Hayes produced a copy of the park rules, which, Mr. Firth declared, possessed no more authority than if he himself had had them printed. Section 9 of the Royal Parks Act, added Mr. Firth, required that park rules to be legal and authoritative should be first laid before both Houses of Parliament. But he could produce evidence to show that those rules had not been before Parliament, and that the rules that had been submitted to the House contained no mention of a ten-mile limit.

Eventually the further hearing of the summons was adjourned for the solicitor to produce official witnesses in support of his contention.

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Barnet	Exceeding legal limit	£5, etc.
Greenwich	Not making use of all means provided for the prevention of noise by the action of the machinery of the car	20s., etc.
Chichester	No rear number	Dismissed on payment of costs to avoid endorsement of licence.
Chelmsford	Driving an unregistered car	£2, etc.
Edinburgh	Reckless driving	£2, etc.

The Consolidated Engineering Company, of Slough, have sent us a sample of a patent foot-warmer they are introducing for use on motor-cars. It is externally a reduced facsimile of the familiar railway carriage foot-warmer; it is, however, filled with acetate of soda, and when boiled for a period of fifty minutes will, it is claimed, retain its heat for seven hours. Those who have done much motoring in cold weather will find the foot-warmer a useful adjunct to the equipment of the car.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, FEBRUARY 11, 1905. [No. 310.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

WE are glad to learn that the committee of the A.C.G.B.I. are about to take joint action with other national automobile organisations with a view to convincing the French Club of the injury they are doing a great international event. Surely our confreres across the Channel, who have done so much in the past to bring about international amity amongst motorists, must now recognise how they are alienating the sympathy of the world by maintaining their decision to run a joint race. In face of the universal dissatisfaction it is to be hoped they will revert to the conditions of the last few years and run their Grand Prix contest as a separate event. It is not too late for them to rehabilitate the French Club to its position as leader of the sport, and the sooner that is done the better will it be for everybody interested.

◆ ◆ ◆

A Motorists' Defence Fund.

DURING the past year the Motor Union has been doing a maximum of work with a minimum of income, and, at length, an appeal is being made to all interested in the movement for an effective defence fund to be raised without delay. Hitherto it has rendered help in some cases of obvious injustice, but its means of usefulness have been hampered by the want of funds, and without a strong financial backing from motorists throughout the country it is impossible for the organisation to act up to the anticipations which were formed at its inception. The formation of the proposed Legal and Legislative Defence Fund comes at an opportune moment, in view of the election that is anticipated, prior to which the systematic education of aspiring Parliamentarians should be undertaken in a way never before attempted. "He gives twice who gives quickly" is a saying with which we would emphasise Colonel Holden's appeal to motorists to place their movement beyond the reach of the village constable and the bucolic J.P.

◆ ◆ ◆

The Agricultural Hall Exhibition.

NEXT month Cordingley's Tenth Annual Exhibition of Motor-cars at the Agricultural Hall, London, will be held under the auspices of the Automobile Mutual Protection Association, of which the Earl of Shrewsbury is the president. This event is always regarded as the opening of the season's trade, and many makers are reserving their latest models for public introduction at this display. The list of exhibitors is thoroughly representative of every section of the industry, and great preparations are being made not only to secure a comprehensive show of automobiles, but also a record attendance of the public, or, at least, those members thereof likely to become owners of motor vehicles. And, after all, those are the people with whom the maker or agent is desirous of coming into contact. We have previously dwelt upon the fact that the Minor Hall is already assured of an imposing array of commercial vehicles, and the arrangements made for the reception of heavy wagons elsewhere in the Great Hall have already been called into requisition. The Agricultural Hall has a larger exhibition area than any other building in London, and the Show that will be held there from March 18th to the 25th will be the greatest automobile display of the year, with the single exception of the premier show at Paris.

◆ ◆ ◆

An Aeronautical Display.

IN addition to the selection of automobiles of every kind, there will be an important section wholly devoted to exhibits of aeronautical interest and value. This is being organised by the Aero Club of the United Kingdom, and will include illustrations of the various systems of aerial navigation that have been tried from time, to time; balloons, cars, and various scientific instruments forming the equipment of the modern aeronaut. Models of the airships that have been famous during the last decade, propellers, recording apparatus, kites, etc., will be on view, and the collection of photographs will be the most comprehensive yet brought together in this country.

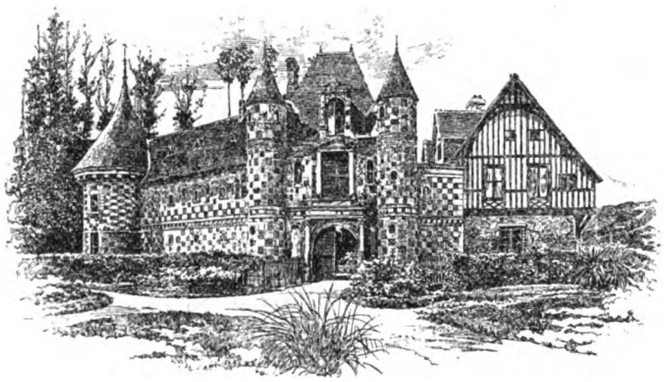
◆ ◆ ◆

Motor Ambulances.

AT the time of the last motor-car exhibition at the Agricultural Hall much interest was aroused on the subject of motor ambulances for the Metropolitan Asylums Board, and two members of that body visited the Exhibition, making inquiries of several leading makers of motor vehicles. Little has come of the matter, until at Saturday's meeting the Board considered a report brought forward by Lord Donoraile on behalf of the Ambulance Committee suggesting advertisements for tenders for the supply of a motor-propelled ambulance. The cost was not to exceed £500, and the vehicle was to be subject to experimental use before purchase. Mr. White moved as an amendment that the discussion of the motion be deferred for six months. He urged that a suitable vehicle had not been discovered, and that experiments ought not to be made with the ratepayers' money. The amendment was defeated by 26 votes to 23, and the recommendation was adopted by 28 votes to 16. We trust that manufacturers will assist those members of the Board who have advocated the use of motor ambulances by doing all they can to produce satisfactory and vibrationless vehicles.

◆ ◆ ◆

Steam and Electric Vehicles.



ANOTHER series of demonstrations on the internal combustion engine has been arranged by the Ladies' Automobile Club, and should attract widespread attention in view of the number of ladies who now drive their own cars. We are glad to see that the suggestion thrown out in these columns some time ago as to one lesson being devoted to describing the working of steam and electric vehicles has been adopted so far as the former are concerned. There is no doubt that the steam and electric automobiles now running in this country are giving much satisfaction to owners; hence the wisdom of catering for the users of all types of vehicles.

Motor Mountaineering.

Some interesting experiences of motor mountaineering in the Alps were given by Captain H. H. P. Deasy in the course of a lecture delivered on Tuesday afternoon at the Ladies' Automobile Club. In some of the more remote mountain villages included in a 3,000 kilometre trip it had been scarcely possible for the car to scrape between the two rows of houses in which the little community dwelt; while on more than one pass the track was deliberately made so that it sloped towards the unguarded verge of the precipice. Unseen dangers often lurked behind corners and bends. Reins were not used in some parts, while in others the drivers encountered almost invariably proved to be asleep; hence on one occasion a three-horse diligence had all but driven them backwards over a precipitous mountain side; while another time a mule that had taken fright at the sound of their unseen coming dashed across the front of the car as it was rounding a bend, but, with the cunning of its kind, the animal pulled up dead on the extreme edge of the track. There were parts where the car had to be pushed by the passengers because the track was so frail that it would have given way had the driving effort of the motor been communicated to the ground wheels. On coming down the mountain railway on the Rochers de Naye, too, one of his wheels broke through a rotten plank that formed part of a span across mere space; while in negotiating the formidable Forclaz, between Martigny and Chamonix, the track doubled on itself so abruptly at intervals varying between 50 and 100 yards that the car had to be backed and advanced as many as four and five times before they could proceed.

◆ ◆ ◆

Trains, Trams, and 'Buses.

Recent meetings of the shareholders in the leading railway companies of the south and east of England have found the chairmen in a dolorous mood, owing to the growing competition of electric trams in the suburbs of large towns. Both the London, Brighton, and South Coast and the Great Eastern railways have been particularly hard hit by recent developments in electric trams. These latter, however, are not to have it all their own way, for they, in their turn, are complaining of the rapid and apparently permanent institution of the motor-'bus as a means of London's locomotion. The public, however, who are anxious only to get from place to place in the shortest possible time, with some guarantee as to safety, are not likely to pay heed to the complaints of either railway or tramway companies. Requiring no special track, the motor-'bus can be diverted in any direction to meet the changing needs of different localities. The economy of installation, too, is a matter likely to reduce the charges of working, and, altogether, now that motor-'buses are showing their reliability, their future is quite safe, especially so far as the metropolis is concerned.

◆ ◆ ◆

Increased Speed of Tram-Cars.

The Council of the Tramways and Light Railways Association have, in part, recognised the growing competition of motor-'buses, and its memorial to the Board of Trade asking for powers to run tramways at a greater speed than has hitherto been allowed is an interesting sign of the acceleration of pace that has come about since the man with the red flag was removed from in front of the motor-car. In their petition the association give an instance of a motor-'bus travelling from Piccadilly Circus to Kensington Church at a speed of twelve miles an hour, including stops. Allowing for the various halts consequent on traffic, and the alighting of passengers, more than fourteen miles an hour was attained at times, and the council of the Association goes on to say that this was maintained with perfect safety at a great convenience to the public. This testimony from a body of men whose interests have been thrown into jeopardy in more districts than one by the advent of the motor-'bus is important in view of the outcry that is likely to be raised when three or four hundred motor-'buses are placed upon the streets in the spring.

◆ ◆ ◆

What is a Reasonable Time for Trial?

James Blackmore, a driver of a motor-wagon, giving an address at Southwark, was summoned before Mr. Baggallay, at Woolwich, on Tuesday, for driving an unregistered car in Woolwich Common Road, and for failing to produce his licence. Mr. Thomas H. Pickett, of Park Street, Southwark, was summoned for aiding and abetting the commission of the offence. Mr. F. J. Poole, solicitor, defended, and contended that as the car, which had been registered at Chester, was only being used on trial prior to purchase by Messrs. Barclay, Perkins and Co., brewers, it was exempt from registration under a sub-section of the Motor Car Act. It was stated that the car had been sent for a week on trial, and that a further month's trial was asked for and allowed. Mr. Baggallay said the only point was what was a reasonable time for a trial; a man might wish to try if a car would last a year. Mr. Poole said the point had never been decided. In the result Mr. Baggallay adjourned the summonses in respect to the registration. On the summons for failing to produce his licence Blackmore was fined 5s. and 2s. costs, Mr. Poole stating that he had inadvertently left it behind.

◆ ◆ ◆

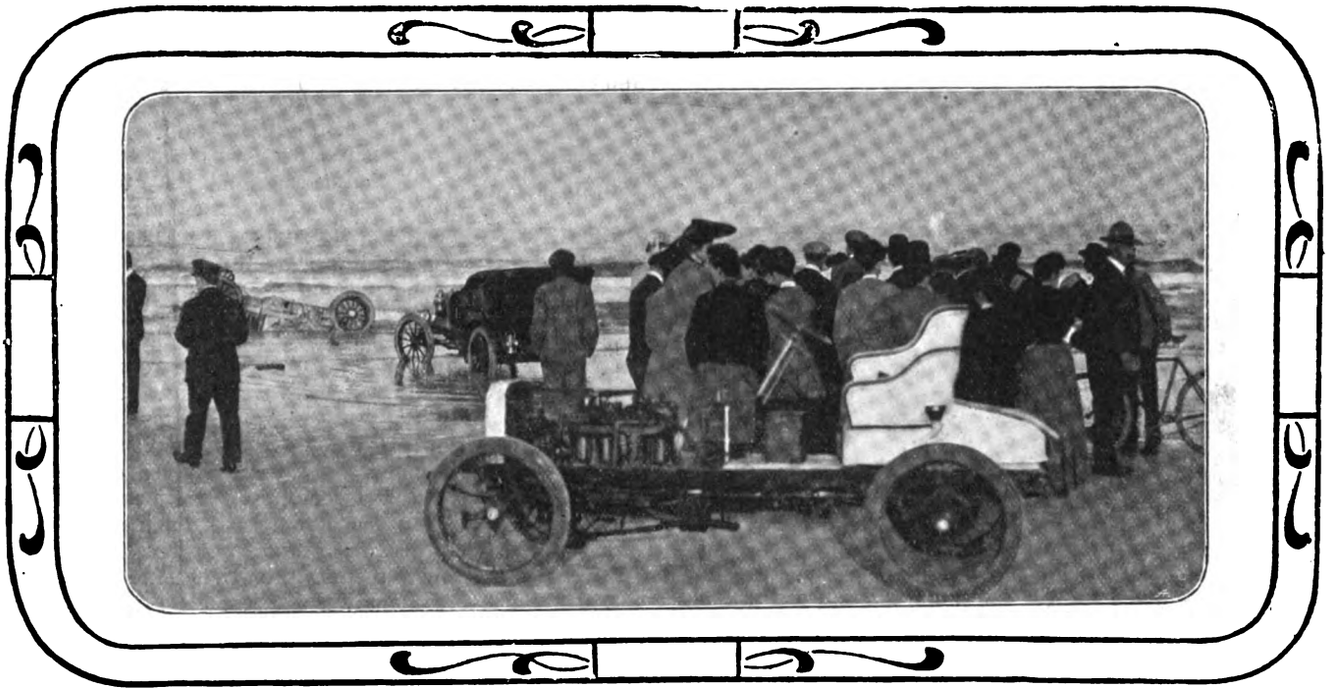
The 5,000 Miles Motor Trial.

The 5,000 miles trial of the 12-h.p. Siddeley car, held under the supervision of the Automobile Club, began on January 2nd, since which date daily runs have been made of about 150 miles on almost every main road out of London. Four persons have been carried throughout, or the equivalent weight, and every involuntary stoppage has been recorded by an official observer appointed by the Automobile Club. At night the car has been locked up in the Automobile Club's motor house, and no adjustments have been made except in the presence of the observer who has recorded them. The result of the trial is most remarkable and a great triumph for an all-British car. For over 4,500 miles the car ran without any involuntary stop from mechanical troubles. There were a few stops for tyre troubles and one due to a short supply of petrol. This is a record which will be hard to beat. The driving has been in the hands of Mr. Sidney Girling, who last year was one of England's representatives in the Gordon Bennett race, and he was assisted by Mr. A. E. Sutcliffe. In all there were thirty-three daily runs over all sorts of roads and in all kinds of weather, and the genuineness of the trial, guaranteed by the Automobile Club, is beyond dispute. With regard to the

Digitized by Google

tyres it may be mentioned that Continentals were employed, and that their behaviour over every kind of road, and in all weathers, was as good as that of the car whereon they were used.

◆ ◆ ◆



Widening Roads.

THE state of the Hanwell-Uxbridge road has been a cause of grave complaint for some time by motorists and cyclists. The Roads Improvement Association have recently made representations to the Middlesex County Council upon the matter, and the Council are now proceeding to widen the Uxbridge main road between Southall and Uxbridge at the very narrow places to which attention has been called, pending a larger scheme for the improvement of the road, arrangements for which are under consideration. Both the Roads Improvement Association and the Middlesex County Council are to be congratulated on this result. The county authorities will have to recognise their duty in such circumstances, for, after all, they are the custodians of the public convenience, and do not exist merely to retain ancient highways in the form in which they were known to our grandfathers.

◆ ◆ ◆

Two Horses v. One Motor-Car.

REALLY something will have to be done to protect motorists from the attacks of horses. The other day a hunter was being exercised at Market Harborough, when it suddenly reared and capered about in quite a wayward fashion. It alighted with its fore feet on a passing gig, frightening the animal between the shafts to such a degree that the latter bolted at a furious pace, ultimately dashing into Sir Humphrey de Trafford's motor-car, which was coming from the High Street towards the station. The force of the collision was terrific. The horse turned a somersault, but, to the surprise of those who saw it, got upon its feet again, and, though evidently stunned, apparently escaped without serious injury. The motor-car was considerably damaged, the mudguards being buckled up, and the side of the car smashed. Sir Humphrey de Trafford and his chauffeur were in the car, the latter driving. Fortunately, neither of them was hurt. The groom, who was thrown violently out of the gig, had a nasty shaking, and also sustained some cuts about the face, one of the hoofs of the hunter grazing him when the animal came down on the gig; and all because of the unreliable temper of the horse.

The Automobile Meeting on the Ormond-Daytona Beach, Florida, was unfortunately attended by a fatal accident. Mr. Frank Croker, driving his Simplex Car, had to make a sudden swerve in order to avoid a cyclist. It is stated that as a result one of the tyres left the wheel, causing the car to overturn, as depicted above, the accident resulting in the death of both Mr. Croker and his mechanician.

◆ ◆ ◆

In the Lake District.

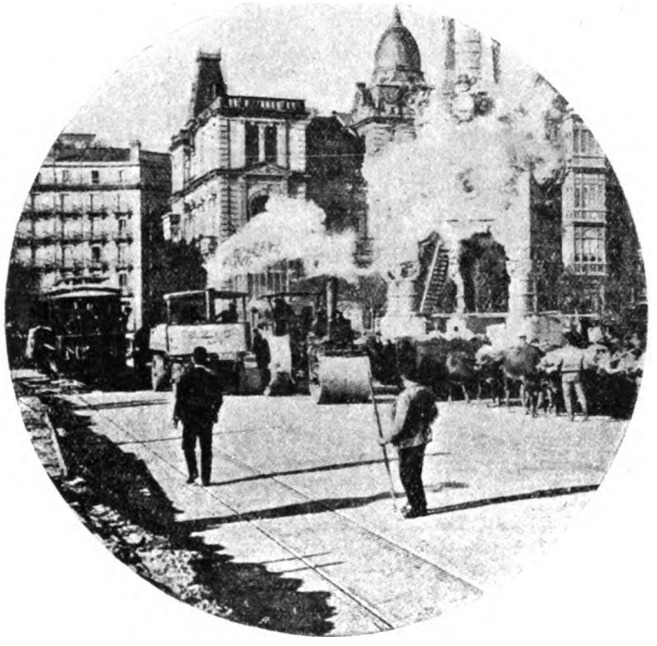
THE experiment made last season in the adoption of a motor-car service between Windermere and Keswick proved so successful as to encourage those who undertook the enterprise to place orders for a considerable number of motor-cars to be employed during the coming season on the popular Lake District route, and possibly in other directions as well. Those who have identified themselves with this new departure in the Lake District are mainly those gentlemen who hitherto have run the coaches. It was felt that tourists and the public generally would not readily take to this form of locomotion, and certainly there is still some lingering favour shown to the old and picturesque stage coach, which has been employed in this hilly country from time immemorial, but the speed and ease with which motor-cars cover the distances, and their greater hill-climbing capacity, have worked very materially in increasing their popularity. The combination of motor-car trips with motor-boat excursions on the Lakes would be an even more attractive feature of this year.

◆ ◆ ◆

British Motor Trades Alliance.

DURING the last few days the British Empire Motor Trades Alliance has been formed in order that those particularly interested in the manufacture of motor-vehicles and motor-boats in the British Empire should have an opportunity of conferring as to how the best interests of motor manufacture in the Empire may be served. Endeavours are to be made to influence the A.C.G.B.I. and other automobile clubs and societies to encourage the use in the United Kingdom, the Colonies, and India, of cars built within the Empire. Membership is confined to directors, principals, secretaries, or managers of firms manufacturing motor-vehicles or motors within the British Empire,

Digitized by Google



and also sole agents for such vehicles and motors. Associate and honorary members will be admitted, and the provisional committee, with Mr. Claude Johnson as hon. secretary, is now approaching suitable persons with a view to their becoming members of the Alliance. We wish the society every success.

◆ ◆ ◆

Small Stones on Public Roadways.

THE practice of throwing gravel upon the roadways during greasy or frosty weather is a very general, and, from the motorist's point of view, a very undesirable one. As a rule the gravel consists of sharp edged pieces of flint, which have no regard for the tyres of motor-cars. Of course there is no desire to thwart the authorities in their laudable efforts to secure the safety of horses on the public streets, but protest must be made against precautions being taken which, from the nature of the material used, must be inimical to the interests of another section of the public. And in view of the large number of small flints that are daily distributed over our roadways it may well be suggested to borough surveyors that they should give the matter their attention. It need not be associated with a selfish view of things, for the mechanically-propelled vehicle is making for universal helpfulness.

Testing a New Bridge at San Sebastian, Spain, by Electric Tramcar, Steam Wagon and Traction Engine.

◆ ◆ ◆

Why not Shoot?

THERE is a humorist in Warwickshire who has just delighted some of the members of the County Chamber with a letter in which he offers to shoot motorists at a very cheap rate. The chairman of the Chamber recently told his fellow members that he should instruct his wagoners to drive across the road when motor-cars approached at what they regarded as a furious rate. The idea seems to have attracted at least one person, who thereupon wrote to a Warwickshire agriculturist as follows:—"As I doubt the power of the average farm labourer to distinguish between the innocent and guilty, I offer my services. I hold a discharge as a sergeant from the army, and am a trained shot. At least fifty motors pass my house every day. With an ordinary magazine rifle I could get about thirty daily, and I offer my trained services to the Chamber at a charge of sixpence per head. I should like to hear to whom to forward the heads. I could use explosive or poisoned bullets, if so desired." Such procedure would, doubtless, appeal to many anti-motorists, as being more expeditious than the ordinary legal way of dealing with those who drive mechanical vehicles on the roadway; but where is the insurance company that would take the risks?

◆ ◆ ◆

The Reduced Speed Limit.

ALTHOUGH no fewer than 266 local authorities in England and Wales were entitled by the Motor Car Act to make applications to the Local Government Board for the reduction of the lega limit to 10 miles an hour in their areas, only thirty-two saw fit to make the request. Of these fourteen came to the conclusion that second thoughts were best, and withdrew their applications. With regard to the remainder, eleven inquiries have already been heard, and in no single case has the Board seen its way to yield to local prejudice. We announced last week that the Dover application had been refused. It is freely rumoured in Surrey that the Kingston request will be similarly treated, and altogether it would appear that the Local Government Board is proving very friendly to motorists, and recognising that the vested interests of small towns are in the main the instigators of the movement against automobilism.

◆ ◆ ◆

Inland Revenue.

REMEMBRANCE of the Inland Revenue has been made officially to all who own motor-cars, and the authorities are displaying unwonted alacrity in gathering in the shekels. Those who possess motor-cars, the weight of which does not exceed one ton or is upwards of three tons, have to pay two guineas for the licence. Should the weight of the vehicle exceed one ton, but not exceed two tons, the licence costs four guineas; five guineas is charged in the case of motor-cars exceeding two tons unladen, and three tons. Thus it seems as though motor-vehicles of three tons or upwards, such as are permitted in the new Order just issued, ought to be allowed the licence fee of two guineas. Hitherto such vehicles have not been regarded as "light locomotives," and users will doubtless attempt to secure registration on the two-guinea scale defined as for vehicles "not exceeding one ton, or of three tons or upwards." It will be interesting to see how soon the Inland Revenue authorities deal with the anomaly thus created.

AN action is pending between Messrs. Milnes-Daimler, Limited, and the Daimler Motoren-Gesellschaft against the Motor Traction Company, Limited, for slander of title.

THE Automobile Club has withdrawn its appeal case against the British Automobile Commercial Syndicate, and has agreed to pay the costs.

MR. BASIL JOY, the head of the technical department of the A.C.G.B.I., has, to the great regret of the members, given notice to terminate his engagement with the Club in August.

AT the non-skid trials, at the Crystal Palace Exhibition, ten marks were awarded for capacity in turning, braking, and starting. The Samson device secured the first award, having the maximum of marks for each point, as did the Grose for turning, and the Sawyer, Watkins, and Empire for braking. The Grose was awarded second place.

ON visiting the Crystal Palace Show towards the end of last week we noticed that the Star Engineering Company had on view no less than eight vehicles, including *chassis* of the 7-h.p., 10-h.p., and 20-h.p. Star cars. An interesting example of the 7-h.p. two-cylinder Little Star was to be seen in one fitted with a Limousine body. The 10-h.p. four-cylinder car, which was described in these columns in the early part of December, is now provided with ball bearing to the gear-box shafts, the differential shaft, and the road wheels.

Mr. and Mrs Chas. Jarrott on their Crossley Car.

TO COBHAM ON A CROSSLEY.

IT was a fine morning, with something more than a suggestion of Jack Frost in the air, when Mr. Charles Jarrott and the writer set forth from the London depôt of Messrs. Jarrott and Letts, Limited, in Great Marlborough Street, for a run to Cobham on a Crossley car. Steering cautiously through the traffic, we were soon crawling at the snail-like pace allowed in the Royal Parks, scanning the trees meanwhile to catch a glimpse of any lurking policemen that might be lying in ambush watchful for acceleration of pace on the part of guileless motorists.

And then by the route known to every southern motorist, and many an one from the north, we sped across common and park to Kingston, negotiating corners, dodging passing vehicles, and going on our way with an ease that was appalling to the man on the look-out for incidents for the entertainment of readers.

At Cobham we lunched, and then set out at a rattling rate to the Hut, at Wisley—just to see if something would happen. No; everything was well, and back again to town with an absence of happenings that, but for the motoring reminiscences of the man at the wheel, would have proved monotonous.

The driver on the Crossley car has really nothing to do. On fourth speed practically all the way, the flexibility of the four-cylinder engine and the ease of control were amply demonstrated. To slow down to keep behind a crawling 'bus and then shoot forward of a tramcar is a silent operation, involving no strain on the parts, nor no jarring on the nerves of the passenger.

Nowadays the automobile, to be appreciated, has to be a silent wayfarer of both town and country. Electric vehicles have their limitations; petrol cars their rumblings and purrings —fortunately growing less distinctive as cars improve. The Crossley has improved. Its behaviour in traffic is perfect, and even when slowed down at the bidding of the Bobby it stands at rest apparently as motionless and certainly as quiet as a thoroughbred. Keeping pace with some electric broughams one was forced to the conclusion that the Crossley is quite as serviceable for Society ladies as for touring purposes. Its silent, vibrationless running is a notable feature of a notable car.

The motor is of 22-28-h.p., developing about 30-b.h.p. at a normal speed of 900 revolutions per minute, and it is the intention of the constructors to keep to the one size, standardising every part to facilitate the supply of anything that may be wanted in an emergency, and to prevent that depreciation of value which frequently follows the changing styles from one season to another. With its stylish bonnet, long wheelbase, and generally bold outline, the Crossley is becoming familiar among the motor-cars met with in the West End of the town.

At West Ham 278 automobiles were registered last year, of which only 62 were motor-cars.

A sequel to the terrible accident at Cudworth is, the General Accident Assurance Corporation report, to be found in the unprecedented sale of Charles Letts' diaries, containing an accident insurance policy for £1,000. Since January 1st, nearly 250,000 persons have insured against the risk of travel by means of these coupons.

The 1905 models are beginning to make their appearance at the West End depôts. At Messrs. Lamb Bros. and Garnett, on Tuesday, we inspected one of the latest National 20-h.p. three-cylinder cars, and, among the improvements, note that the cylinder dimensions have been increased to 4¼ in. bore by 5¼ in. stroke. The carburettor is now of the automatic air regulating variety, and another feature is the variable lift device connected with the inlet valves. The wheel base has been extended to 8 ft. 4 in. to allow of side entrance bodies being fitted. On the same day we called at the depot of Mr. H. C. Dignasse in Marshall Street, W., where one of the latest Sunbeam 12-h.p. pair-cylinder cars had just arrived. The most noteworthy change in this well-known car is the adoption of mechanically-operated inlet valves and a variable lift device, controlled by hand and foot. The variable lift is obtained by means of tapered cams on the cam shaft, the latter being so arranged that it can be bodily moved to and fro. Like the National, the Sunbeam car is now made of such a length as to permit side entrance bodies to be fitted.

THE "HALLEY" STEAM WAGON.

AMONG the latest additions to the ranks of British steam wagon builders is the Glasgow Motor Lorry Co., Ltd., of Crownpoint Road, Glasgow, whose vehicle we are this week able to describe. The wagon, of which we give a general view in Fig 2, is built under Halley's patents, and is designed to carry a load of five tons and to haul a further two to four tons on a trailer. The main frame is of channel steel, well gusseted and stayed, and is riveted throughout, no bolts being used.

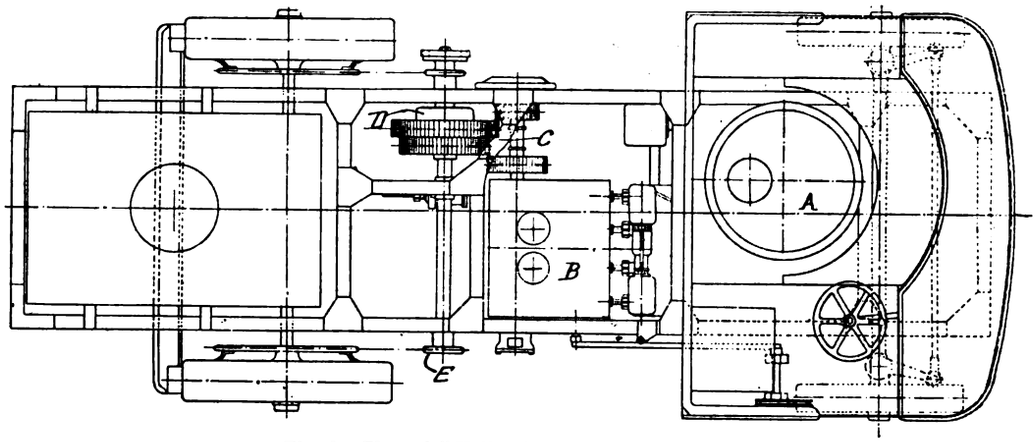

Fig. 1.—Plan of "Halley" 5-ton Steam Wagon.
A. Boiler. B. Engine. C. Change Speed Gear. D. Differential.

The boiler is of a patent combined water and fire tube, centrally-fired type, and is constructed wholly of mild steel. It is designed with a view to permitting ready internal inspection and cleaning, and is not easily damaged through incompetent handling. A steam drier is incorporated in the top of the steam space, preventing priming and ensuring a supply of dry steam to the engine. The boiler contains 86 square feet of heating surface, and 3·1 square feet of grate area; it works at a pressure of 200 lbs. to the square inch, and is hydraulically tested to 400 lbs.

The engine, which is suspended at three points, is of the horizontal compound type, having cylinders 4½ in. and 7 in. diameter by 6 in. stroke, and works normally at a speed of 450 revolutions per minute. It is fitted with link motion, and all the working parts are completely enclosed in a dust and oil proof casing. The engine may safely be run at a higher revolution than the normal, thereby enabling a high road speed to be maintained on good roads or when running light. A special starting and power-increasing device is fixed between the low and high pressure cylinders, enabling the driver, through simply moving the reversing and linking-up lever further out or in, as the case may be, to convert the engine into a double high-pressure engine, exhausting to the atmosphere; ensuring a start on the steepes, gradients, and allowing the wagon to climb very stiff grades, and of readily getting out of bad places.

The gearing gives two ratios, one for level and easy grades, and one for heavy gradients. It is of steel throughout, with machine-cut teeth. The gear wheels are securely bolted to the differential box. From the countershaft the power is conveyed to the rear road wheels by Renold roller chains. The pump is of an improved dust and oil-proof encased automatic type, and is self-lubricating; it is worked, geared down, direct from the engine crankshaft, and can be used to feed the boiler whilst standing when raising steam. A compact high-duty injector is bolted direct to the boiler-shell, and may be used to feed the boiler whilst standing or running. The water-lifter, which is capable of filling the water-tank in six minutes, is bolted direct to the side of the tank, and is controlled from the driver's seat. The steering gear is of the Ackerman type, swivelling on hardened steel parts; the axles are of nickel steel, capable of withstanding very rough usage; the road wheels are of the artillery type, with oak spokes, ash felloes, and malleable steel hubs, fitted with gun-metal bushes, and shod with steel tyres 10 in. wide on the driving wheels, and 6 in. on the steering wheels. A special form of instantaneous steam brake acting direct on the driving wheels is provided, this is of great power, and is operated by a turn of the driver's wrist. The engine forms the second brake, and will hold the vehicle on all reasonable hills. The water tank has a capacity of 135 gallons, sufficient for twenty miles running, while the bunkers contain sufficient fuel (coke) for one day's run. Any type of body can, of course, be fitted to the *chassis*, which has a wheel base of 9 ft. 9 in., and a track of 5 ft. 6 in. Throughout, the vehicle bears evidence of careful design and construction, and that the makers have faith in its practical working is evidenced by the fact that they are willing to undertake to keep any of their wagons in service in the Glasgow district in complete repair for a moderate fixed annual charge, a facility which will no doubt be taken advantage of.

CONTINENTAL NOTES.

The Gordon Bennett Deadlock.

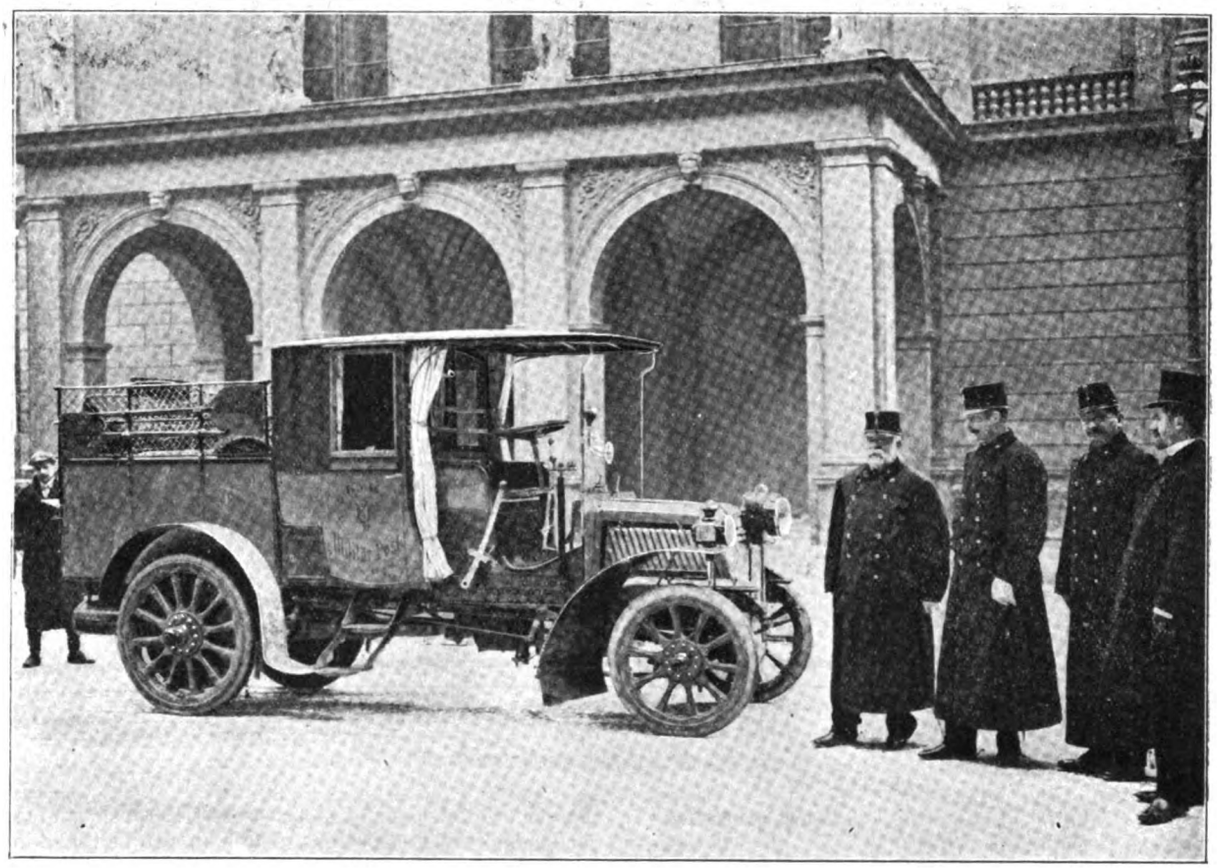
The position with regard to the decision of the A.C.F. to run this year's Gordon Bennett race in conjunction with the Grand Prix has undergone no important change during the past week. The Austrian and Italian Clubs have now followed the example of the British, German, and Swiss Clubs in sending a formal protest against the joint race to the A.C.F. Baron de Zuylen, the president of the last named body, has this week been to Berlin to confer with the German Club, and everyone is anxiously waiting to see what the committee of the French Club will do in the matter. "Le Journal de l'Automobile" gives publicity to a rumour that the question of postponing the Grand Prix to 1906 and of running the Gordon Bennett race alone this year for the last time is under consideration. M. Paul Meyan, of "La France Automobile," views with alarm the opposition in foreign countries which the decision to hold a joint race has engendered, and expresses the hope that the Committee of the A.C.F. will find a way out of the deadlock which will give satisfaction to all countries, otherwise the latter will become closed markets to the products of French motor-car works.

◆ ◆ ◆

The French Eliminating Trials.

Altogether twenty-six cars have been entered for the French eliminating trials—viz., three Panhards, three De Dietrichs, three Darracqs, three Renaults, three Mors, three Clement-Bayards, three Hotchkiss, three Richard-Brasier, one C.G.V., and one Gobron. This is a decrease as compared with last year's eliminating trials, for which there were twenty-nine entries. A noticeable absentee is the Gardner-Serpollet Company, whose abstention is due to the fact that M. Serpollet considers the entry fee of £400 per car much too high. It is understood that although the Serpollet steam car will not participate in the Gordon Bennett-Grand Prix joint race, it will still take part in the many other competitive events to be held in France during the coming season.

◆ ◆ ◆



Educating the Youngsters.

The French Automobile Club is setting an example which might well be followed in this country; it has decided to issue a wall chart for school use, depicting a modern motor-car, and giving a brief explanation of the vehicle, and also instructions how to avoid accidents owing to motor traffic.

◆ ◆ ◆

A Swedish Motor Exhibition.

An international exhibition of automobiles and motor-boats is to be held at Stockholm, from April 19th to April 30th next. The show, which is being organised by the Swedish Automobile Club, under the patronage of H.R.H. the Crown Prince of Sweden and Norway, will comprise: (1) passenger automobiles; (2) goods transport automobiles; (3) automobiles for sanitary and fire appliances and military purposes; (4) motor-cycles; (5) motor-boats; (6) motors for automobiles, cycles, and boats; and (7) accessories and separate parts for the above.

An Austrian Daimler Military Post Car built for the Austrian War Office.
[*Allgemeine Automobil Zeitung.*

◆ ◆ ◆

The Berlin Salon.

An international automobile exhibition, organised under the auspices of the German Automobile Club, was opened in Berlin on Saturday last by the Kaiser, who was accompanied by Prince Henry of Prussia and a numerous suite. The show, which is the most important so far held in Germany—there being about 300 stands—will remain open until the 19th inst.

◆ ◆ ◆

An Automobile Week at Cannes.

The automobile week at Cannes will commence on Sunday next, the 12th inst., by an elegance competition; on the 14th

Digitized by Google

and the 15th the touring-car contest for the cup of the Cannes Automobile Club will be held, the first day being devoted to brake and consumption tests, and the second day to a kilometre speed trial and a hill climb; on the 17th there will be a 25-mile paper-chase, and on the 19th a gymkhana; while on the 22nd there will be a parade of decorated cars.

◆ ◆ ◆

A New Accumulator.

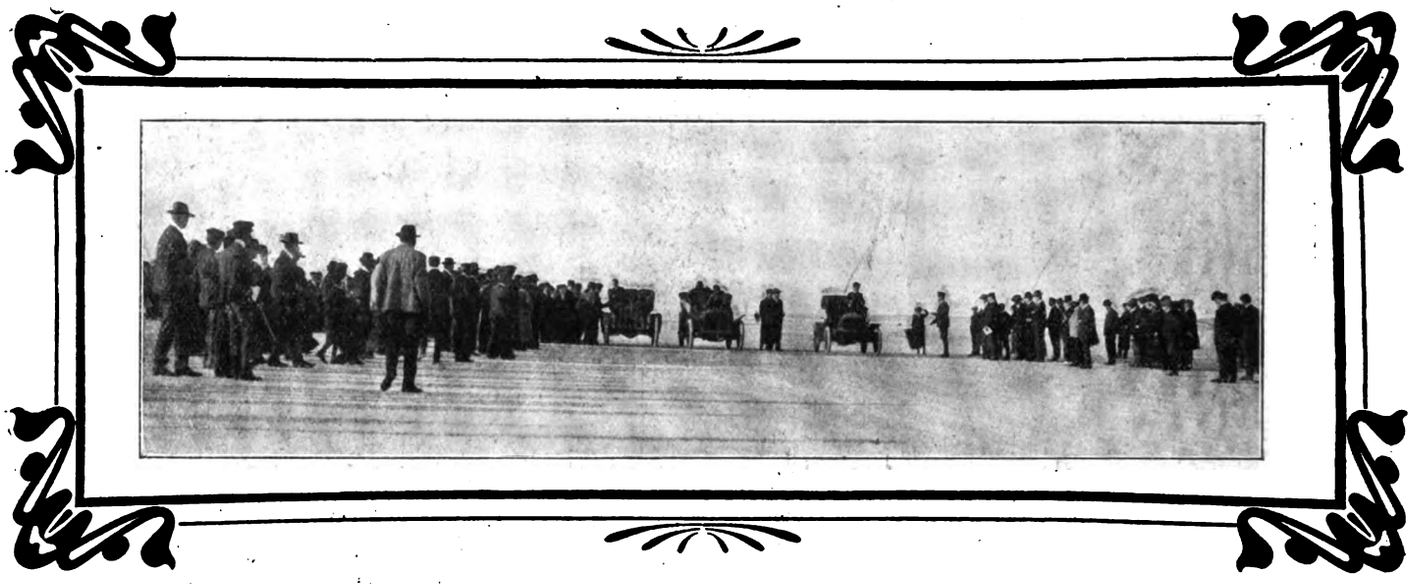
According to "Les Sports," M. Jeantaud, the well-known manufacturer of electric carriages, has invented a new accumulator, in which a special oxide of lead is employed, resulting in a battery not only light in weight but of high capacity. A certificate issued by the Central Laboratory of Electricity in Paris is to the effect that two accumulators were tested, one of the new type, which is known as the E.I.T., and another unnamed. The E.I.T. had fifteen plates (eight negatives and seven positives), weighing 9·27 kilogrammes. The other accumulator had nineteen plates (ten negatives and nine positives), and weighed 11·7 kilogrammes. The tests resulted in the new cell showing a capacity of 382 watt-hours, equal to 41·2 watt-hours per kilogramme, while the unnamed accumulator gave only 40·2 watt-hours per kilogramme. The inventor offers to take any electric carriage at present capable of going 37½ miles on one charge, and by putting in one of his batteries, consisting of 44 cells, of a total weight of 770 lbs., cover a distance of 62½ miles on a single charge.

◆ ◆ ◆

Public Services in Germany.

The Scheibler Automobile Company, of Aix-la-Chapelle, is building a number of motor-omnibuses for a public service between Bad Rippoldsau, Wolfach, and Feudenstadt, in the Black Forest. It is also proposed to start a service between Schopfheim and Neuenweg, in the same district.

◆ ◆ ◆



A Speed Indicator Competition.

The Mid-European Motor-Car Union has now issued the conditions relating to a prize competition for the best speed indicator for motor-cars. The device must show the speed of the vehicle in kilometres per hour in such a way that it can be read not only by the driver and the occupants of the car, but also by others on the road; it must also be capable of being read at night. The mechanism must be such that it cannot be tampered with, and must absorb as little power as possible; it must also be applicable to all types of cars, and be unaffected by dust or dirt. An important committee has been appointed to make the necessary tests of the apparatus sent in, and which are expected to occupy a period of nine months. A prize of £300 will be awarded to the designer of the apparatus deemed to be the best. A fee of £1 is charged for each entry. Full particulars of the competition, which closes on October 1st next, can be obtained from the Geschaftsstelle des Mitteleuropaischen Motorwagen-Vereins, 24, Linkstrasse, Berlin, W.

◆ ◆ ◆

Trials of Public Service and Commercial Vehicles.

The Competition Committee of the French Automobile Club has decided to hold a series of trials of public service and commercial vehicles in August next. The tests of vehicles propelled by electricity will be held on the Paris-Evreaux-Trouville road and will extend over two days. The trials of vehicles propelled by other means will take place in the north-west district of France and will last over eleven days, seven of which will be devoted to daily runs of from 50 to 200 kilometres, and four to exhibitions. The trials will be divided into a number of classes, viz.:—(1) cars carrying more than six persons; (2) vehicles carrying from twelve to twenty-four persons; (3) vehicles accommodating over twenty-four passengers; (4) road trains; (5) cars carrying a load of at least 110 lbs.; (6) vehicles for loads of 440 to 1,100 lbs.; (7) vehicles for loads of 1,100 lbs. to 2,200 lbs.; (8) vehicles for loads of 2,200 lbs. to 3,300 lbs.; (9) vehicles for loads of 3,300 lbs. to 4,400 lbs.; and (10) vehicles for loads of over 4,400 lbs. The points to be taken into account are behaviour on the level and on hills, reliability in operation and fuel consumption.

The Automobile Meeting on the Ormond-Daytona Beach, Florida—On the Starting Line.

◆ ◆ ◆

The Cooling of Petrol Motors.

According to the statistics drawn up by M. Lucien Perisse, 14 per cent. of the petrol cars shown at the Paris *Salon* were cooled on the natural thermo-syphon system, the remaining 86 per cent. having pump circulation. Only 8 per cent. of the pumps were driven by friction off the fly-wheel. As regards radiators, 53 per cent. were of the honeycomb type, and 47 per cent. of the ribbed tube variety. Four-fifths of the cars on view were provided with fans to draw a current of air through the radiators, the proportion of fans being—70 per cent. behind the radiator, 20 per cent. fly-wheel fans, and 10 per cent. both systems combined.

◆ ◆ ◆

The Glare of Acetylene Head Lights.

The Automobile Club de France is issuing a circular to its members urging them not to use powerful acetylene head lights in towns, in order not to dazzle the eyes of pedestrians and the drivers of other vehicles.

Digitized by Google

The "Brotherhood" Car.

(*Continued from page* 1009.)

FIG. 14 is a longitudinal section through the casing containing the contact breaker and commutator mounted on the same shaft. Figs. 12 and 13 are end views looking to the right and left of Fig. 1 respectively. The casing g, which is closed by a removable transparent cover g^1, carries a bearing g^2, in which revolves the hollow shaft e. The latter forms a bearing for the shaft a of the contact breaker and distributor, which comprises a metal disc b^1, having a central hollow boss keyed on to the shaft a, and four arms b^2 projecting at right angles to it. To the metal disc is fastened a disc b of insulating material having recesses into which the arms b^2 fit. Thus when the spring plunger h bears upon the periphery of the rotating contact breaker it is successively in contact with the insulating material b and a conductor b^3, which connects it electrically through the shaft a with the primary circuit. The metal casing of the spring plunger h is fixed to the casing g, but is insulated therefrom and is made a part of the primary circuit. The moving part of the commutator consists of an arm c of insulating material carrying at its outer end a metal pin x which is screwed into a plug x^1 fitted in the rear face of the arm. The length of the arm c is such that the end of the pin x travels close to a metal ring k mounted to correspond with the path described by the pin, in an insulating ring g^3 fixed in the casing g. The fixed part of the commutator consists of four metal pins l mounted in insulating plugs l^1 in the casing g. Each pin is connected with a lead l^2 passing to the plug in one of the cylinders. The pins l

are of such length that the plug x^1 passes very close to them as the arm c revolves. As will be seen from Figs. 12 and 14, the angular position of the arm c on the shaft a and the position of the pins l around the axis of the shaft are such that while the primary circuit is completed through the plug h, the plug x^1 is passing a pin l. When this is the case, the ring k being connected with the secondary circuit through the lead k^1, a spark

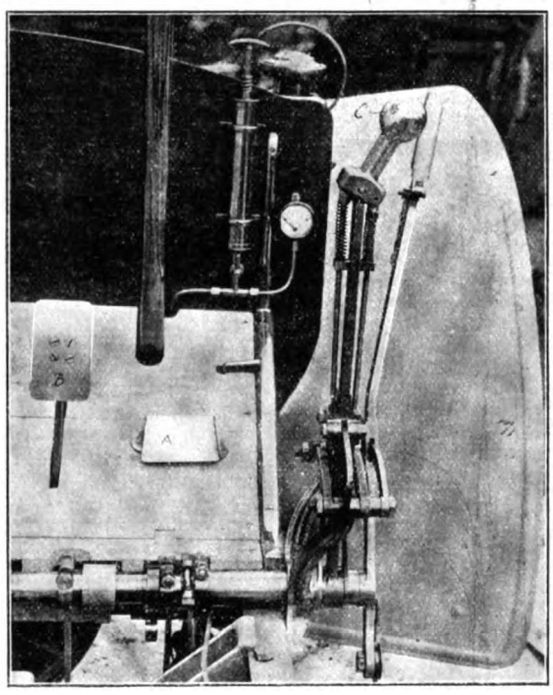

Fig. 11.—View of Control Levers.
A. Pedal Controlling Engine. B. Clutch and Brake Pedal. C. Change Speed Lever.

occurs between k and x, x^1 and l, and across the break in the plug in the particular cylinder whose charge is to be fired. In order to advance or retard the ignition it is only necessary to shift the angular position of the shaft a relatively to the gear that drives it from the engine shaft, because both the contact breaker b and arm c are keyed to this shaft. The commutator is driven through worm gearing off the half time of the shaft of the engine, as shown to the right of Fig. 2. The spindle is in two parts, the upper portion I (Fig. 13), being at its lower end of a square section, fitting into a square hole in the lower part in such a way that while the two parts must rotate together the upper part can rise and fall in the lower half. A centrifugal governor G (Fig 13), is mounted on the upper portion of the commutator driving spindle, its object being that as the speed of the motor increases the arms of the governor will fly out against the action of springs, and so alter the position of the part relatively to the lower part. The top worm gear, which is enclosed in the casing E (Fig. 2), is not only employed to drive the commutator, but also to furnish the automatic advance and retard by shifting the angular position of the shaft a carrying the contact maker b and arm c relatively to the gear which causes it to rotate. In other words, not only is the worm gear used for driving purposes, but it also acts as a sort of rack and pinion, for as the worm rises it alters its position correspondingly to the worm wheel while still continuing to drive the latter. The governor in its action has to overcome the resistance of two springs, one light and the other strong, these being made of a strength proportionate to the resistance to be offered, and provided with nuts by means of which any adjustment, should it become necessary, may be made. The nuts and springs are enclosed by the screw cap marked 2 in Fig. 14. By removing this cap, not only can the tension of the springs be adjusted, but facility is afforded for ascertaining whether the governor is functioning correctly. Automatically-controlled ignition being a somewhat new departure, particular attention has been devoted to the device, which, so far as we were able to gauge from our inspection, works exceedingly well. It has the advantage that when starting up the engine there is no fear of broken wrists or arms owing to back kicks of the engine, the ignition being always in a retarded position when the motor is stopped. As soon as it is running the governor comes into action and instantly advances the sparking, the position of the governor arms fluctuating in unison with the speed of the motor as the latter is varied by the foot control of the inlet valve lift. As will be seen from the description of the ignition system, every care has been taken to assure the reliable and proper working of the same with the minimum amount of attention, whilst means have been provided to enable the most inexperienced to make any necessary adjustments from time to time, or to immediately be able to trace and remedy any defective working that may occur. The general working of the ignition can be observed by the spark gap between the arm C and the ring K of the distributor, which, if working properly, will show eight or nine distinct sparks when the engine is running slowly. As the speed increases, the duration of contact being less, the sparks will reduce in number until at maximum speed only one or two remain. Should the jump sparks not appear in this regular manner, it will show there is a defect in the electrical circuit between the accumulators and the high-tension distributor, but should the sparking be in order on the distributor, but not in the cylinders, the defect will be found to lie in the sparking plug or high tension wire. This can instantly be detected by raising the handle terminal to the sparking plug sufficient to cause a spark gap,

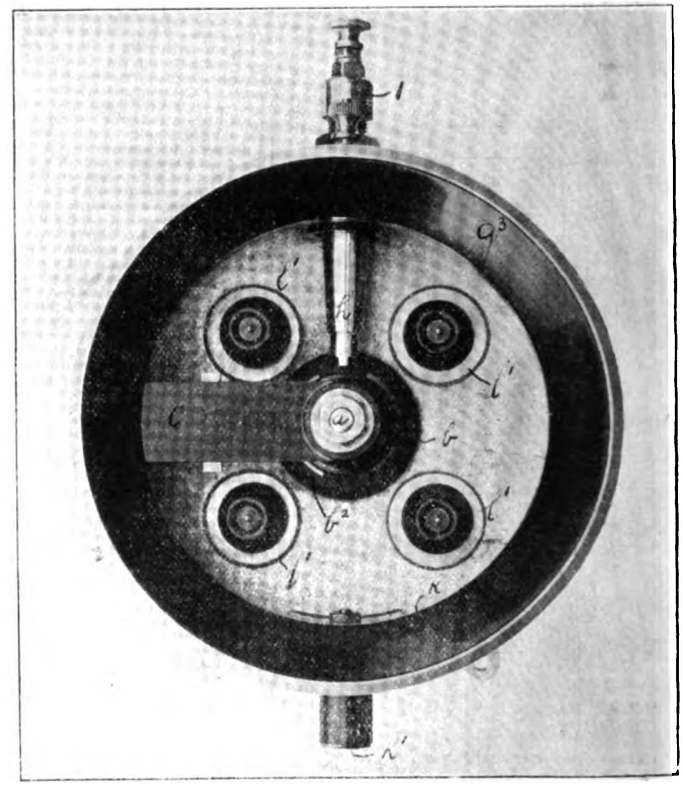

Fig. 12.—Front View of Commutator and High Tension Distributor.

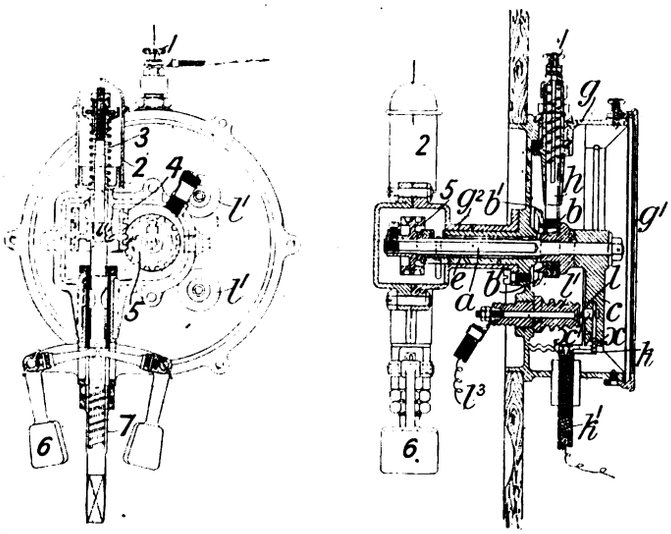
when, if the spark is flowing regularly to the plug, and the cylinder is still missing fire, the plug must be at fault.



Should the coil or trembler be doubtful in working, or defective at any time, as all working parts are easily detachable and interchangeable, it is a simple matter to change them over with spare ones to either decide or remedy the defect.

It may here be mentioned that the explosion takes place

Digitized by Google

in the four cylinders in the order of 1, 2, 3, 4, and that all the various terminals are marked so that no trouble may be experienced in attaching the different wires to their proper terminals.

It is in the method of controlling the speed of the motor that one of the most radical departures inaugurated with the Brotherhood car is found; it is effected by varying the lift of the inlet valves by means of a sliding rack and pinions, actuated by a pedal conveniently located so that it may be operated by the right foot of the driver. The shaft on which the rack is

Figs. 13 and 14.—Rear and Sectional Elevations of Commutator and High Tension Distributor.

formed is shown at *H* in Fig. 10. The upper ends of the valve stem push rods are screw threaded to receive small pinions *B* (Fig. 7), which mesh with the rack; the latter is adapted to slide to and fro in a casing, motion being imparted to it through the bell crank levers *J K* (seen in Fig. 10), by the pedal *A* (Fig. 11). The action of the latter is interesting; it is neither a push nor a press-down pedal, but is arranged to move in a horizontal plane through a small segment of a large circle, the driver using the heel of his foot as a pivot. The pedal has a range of movement between its two limits of just under three inches, and by its means the speed of the engine can be controlled to a very fine degree. As the pedal is moved sideways in one or other direction, the rack is moved to and fro and raises or lowers by a rotary motion the pinions on the push rods, correspondingly reducing or increasing the distance between the top of the pinions and the valve stems, and consequently the lift of the valve. From actual experience we can state that the position and method of action of the control pedal, though new, is exceedingly convenient, and that it can be operated with the greatest ease. Within the range of travel of the pedal all engine speeds can be obtained, from the maximum down to the minimum point at which the motor will continue to run. The pedal is so arranged that at whatever position it occupies it will remain at that point, being unaffected by any downward pressure of the foot as may be unavoidably caused when travelling over rough roads. No automatic governor to control the speed of the engine is employed, this being considered unnecessary, as after a little practice the driver, when declutching by the left pedal, naturally brings over the right pedal to the point at which the engine is bound to run slowly. All the proportions of the engine have been carefully calculated, with the consequence that the motors are easy to start, regular and reliable in working, and so well balanced that they do not impart any perceptible vibration.

The carburettor, which is of the automatic regulation variety, is also of special design, assuring a constant quality mixture at all engine speeds by positively and simultaneously controlling both the petrol and air supplies, and at the same time keeping a nearly constant suction on the petrol nozzle. As will be seen from the sectional illustration of the carburettor (Fig. 15) the parts of the mixing chamber are so arranged that the functions of varying the petrol jet, the main air supply and the auxiliary air inlet are automatically and synchronously controlled by the suction of the engine, this being effected by mounting the petrol needle valve *E*, the air cone *G* and the auxiliary air piston valve *H* on a common stem, so that they cannot get out of adjustment with each other. The spray nozzle takes the form of a long tapered jet *F* into which the needle valve is inserted. The latter is merely a turned stem, tapered and flattened on two sides. A little above the jet is the cone against which the air is deflected on its passage through the carburettor. A little higher up is fitted what may be described as a piston valve *H* having a port which registers with a similar one formed in a chamber and attached to the wall of the mixing chamber. The piston valve is surmounted by a diaphragm piston *A* having a number of annular grooves, and between it and the cover plate is inserted a light spiral spring *B*. The ingress of air, both main and auxiliary, is from the opening at the base of the chamber. In its normal position the petrol orifice is nearly closed by the needle valve, and the auxiliary air piston valve closed. On operating the motor the vacuum induced slightly lifts the needle valve, and with it the air or spraying cone; the petrol is sucked past the flattened sides of the needle, and is sprayed against the cone, where it is mixed with the air drawn through the inlet pipe at the bottom. As the suction effect increases, the upper or piston valve uncovers its port, and an increased amount of air is admitted to the mixture. The action of the increased suction being a simultaneous one, the result has a triple effect; it induces, firstly, a greater flow of petrol as the auxiliary valve rises higher; secondly, the velocity of the air passing the nozzle is kept proportionate to

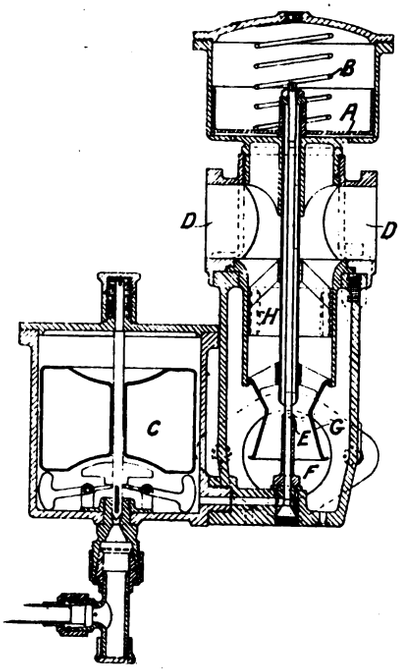


Fig. 15.—Section of Automatic Carburettor.

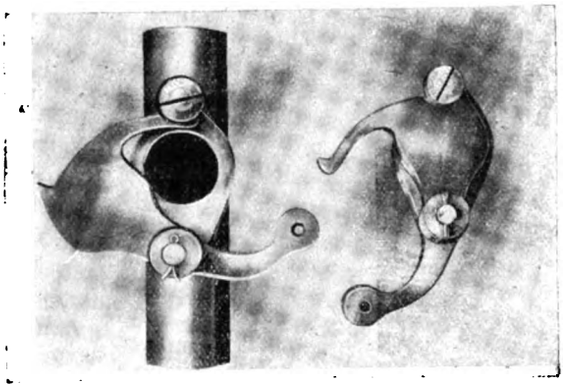

the flow of liquid; and, thirdly, the auxiliary admission of air is automatically regulated in accordance with the engine speed. The petrol, which is fed under pressure to the carburettor, is contained in a corrugated brass tank of a capacity sufficient for 200 miles, securely attached to the back of the frame, with sump and strainer in convenient position for either emptying or cleaning out the tank. The corrugated tank, which is considerably stronger and lighter than the usual plain type, is provided with a combined funnel and filler *Y* (Fig. 10).

(To be concluded).

MOTOR CYCLING NEWS.

We illustrate herewith a useful attachment for the exhaust pipes of motor-cycles, to enable the burnt gases to exhaust directly into the air, which has been put on the market by Mr. P. A. Holder, of the Whipp's Cross Garage, Walthamstow. It is known as the exhaust cut-out valve. The body is arranged to be either brazed on the exhaust pipe or to clip thereon by a band and screws. The sliding cover, which is pivoted on a stud, is opened or closed by means of the projecting lever forming part of it, which, in its turn, is connected by a rod to a suitable lever on the top bar of the machine. In the illustration the valve is shown open at the left, and closed at the right. As will be noticed, stops are provided which prevent the cover from being opened or closed too far, while the pivot on which it is mounted is provided with a spring washer, which keeps the slide close down against the face of the port, but yet allowing

for the expansion of the parts, so that it is impossible for the valve to bind. It is claimed for the device that as contraction or expansion cannot bind it, it can be placed close up against the combustion head, therefore liberating the exhaust before it is choked by passing through the exhaust pipe. An important advantage claimed is that after a hill climb, when the engine is over-heated, if the exhaust lift and the exhaust cut-out valve are opened, to run down hill, cold air is drawn straight into the cylinder without passing through a hot exhaust box and pipe, the engine being cooled much more quickly, which, of course, means greater efficiency. Also under the same condition the valve allows of a much freer running down hill, as there is no drag of the suction through the exhaust pipe and box. The valve is made in various sizes, to suit pipes up to 1¼ in. diameter.

◆ ◆ ◆

In our "Correspondence" columns we publish a letter which Colonel Holden, the President of the Auto-Cycle Club, has issued to makers of motor-cycles in this country, asking for the creation of a fund to defray the expenses of the British team in the contest for the International Motor-cycle Cup. It is to be hoped that the fund will enable such prizes to be given as will make the eliminating trials attractive throughout the country. Apparently the leaders of the motor-cycle movement are growing hopeful as to the prospects of England winning distinction in the international event, and it is to be hoped that their efforts will not be hampered for any lack of financial assistance from firms who will ultimately benefit from the prestige that this country will obtain should it be able to win this sporting event.

◆ ◆ ◆

The new committee of the Motor Cycling Club have already arranged some of the fixtures of the season. The opening run will take place on Saturday, March 25th, to Brighton, followed by the usual dinner and social evening. The all day ride from London to Edinburgh, which was such a brilliant success last year, has been fixed for the second Saturday in June. All who accomplish this great test will receive the Club's special London-Edinburgh badge, as well as a gold medal. About the middle of July there will be a twenty-four hours' ride, with valuable cup for the winner. Other important events already agreed upon are, 200 miles reliability trial, about May 20th, and 100 miles passenger trial, probably June 24th. Inter-team trials for the Motor-cycle Challenge Cup, August 26th. Brown Cup, September 9th. Competition for private members only—that is, these not connected with the motor-cycle trade—early in the summer, exact date and particulars to be arranged later. In addition to its numerous competitions for valuable prizes the Club holds weekly runs. The hon. sec. is Mr. Arthur Candler, 1, Lime Grove, Shepherd's Bush, W.

◆ ◆ ◆

Three countries—England, Germany and Austria—have sent in challenges to the Moto-cycle Club de France in respect of the International Motor-cycle Cup. The race is to be held on June 18th, the eliminating contest for the French team being fixed for the 4th of the same month.

◆ ◆ ◆

The question of trials of motor-cycles has been engaging the attention of the committee of the Auto-Cycle Club at its recent meetings, and the Club has now decided to hold the main reliability trials, open to all classes and kinds of motor-cycles, in the autumn of this year. The committee feels, however, that the importance of demonstrating the capabilities of a motor-bicycle weighing not more than 100 lbs. is such that it should not be delayed any longer. Practically all the motor-cycling experts and authorities are of the opinion that a light and efficient motor-cycle, of course in an improved form as compared with the old heavy 2-h.p. machines, is what is desired by a large section of the motor-cycling public. The committee has therefore decided to proceed with the holding of the special 1,000 miles trial for motor-bicycles weighing not more than 100 lbs. in the first week in April next (April 3rd to 10th), and Mr. F. Straight, the secretary, is issuing the prospectus setting forth the principal rules and regulations. The reasons in favour of the trials appear to the committee to be as follows:—1. If successful, the trial would give a much-needed and immediate fillip to the motor-cycle trade. 2. The performances of the lighter and handier machines would not be overshadowed by the heavier and more powerful ones. The same effect on the minds of the public has been appreciated by the A.C.G.B.I. in the holding of separate trials for the light and heavy motor-cars. 3. The trial would serve to create an interest in motor-cycles amongst those who have been deterred from taking part in the pastime because of the heavy weights of motor-cycles hitherto on the market, and it must be remembered that this interest would be created at the time of year when it will do most good—at the commencement of the active riding season.

A further course of lessons on the motor-car is to be given at the Ladies' Automobile Club by Mr. R. S. Currie.

The Artillery Wheel Works, Limited, have appointed the Coventry depot of the United Motor Industries as their Midland headquarters, where samples of the wheels will be on view.

Mr. Harry Maddox, a well-known Melbourne motorist and member of the Automobile Club of Victoria, met with a rather severe accident a few weeks ago. Whilst driving his motor-car in a country road near Dandenong a heavy draught horse following behind a dray suddenly ran off the road full force into the front of the car, which was just about to pass between the dray and a strong post and rail fence; it caught the front of the car with terrific force, causing it to overturn. The two lady passengers were thrown clear, but Mr. Maddox was pinned beneath the car, cutting his head badly and injuring three ribs. After the car was lifted he was taken to the nearest hotel and a doctor sent for. After about six days he was well enough to be removed to his own residence, but it is expected that it will be some weeks before he fully recovers from the bad bruising and crushing.

HERE AND THERE.

—♦—

During last year 204 motor-cycles and 109 motor-cars were registered at Coventry.

A motor-car service will shortly be inaugurated between Herne Bay and Canterbury.

The Great Eastern Railway Co. are making motor vehicles at their works at Stratford.

An electric motor fire-engine has just been put in service by the fire brigade at Schwerin. Germany.

A collection of lantern slides relating to the automobile movement has been formed by the Motor Union.

"Motor-Car Sports" is the title of one of the most interesting articles in the current issue of "Cassell's Magazine."

An electric traction section has been formed in connection with the French Automobile Club, with M. Krieger as first president.

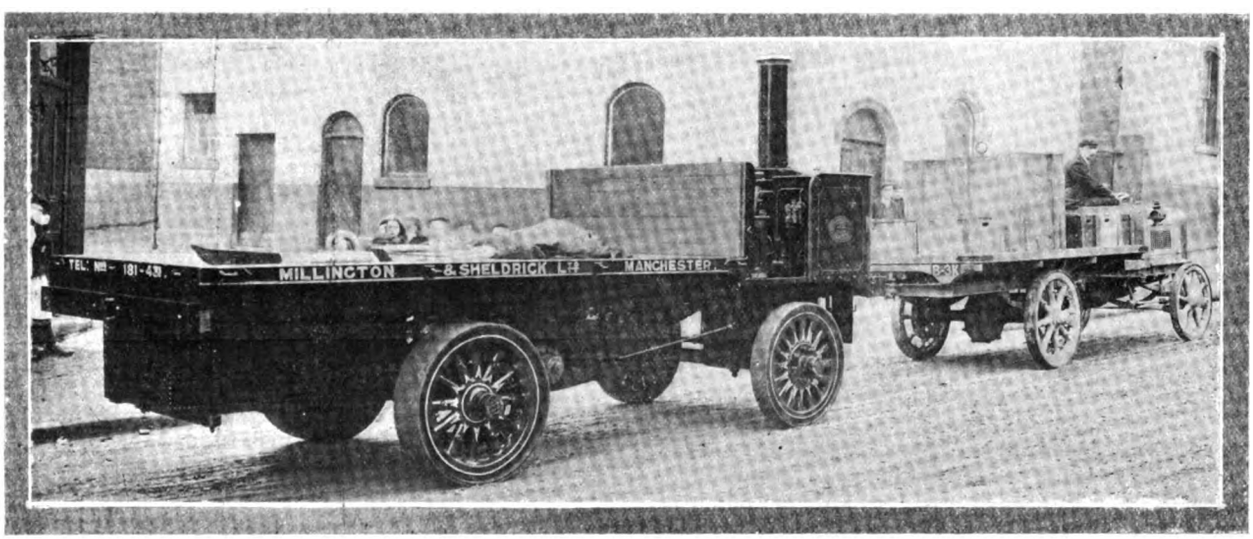
Mr. Holroyd Smith is now giving a course of lectures on automobile construction at the Northampton Institute, Clerkenwell, E.C.

Application for the prohibition of motor-car traffic along Middle Street, Horsham, is being made by the County Council of West Sussex.

Several passenger motor services are being established in Auckland, New Zealand.

Hall's Transmission Gear Syndicate, Limited, has been formed with a capital of £50,000.

Messrs. B. and J. Searle, motor agents, have established themselves in business at Handcross, Sussex.



The Associated Omnibus Company, Limited, of London, intend replacing some of their horse-drawn 'buses by motor-'buses at an early date.

The Continental Caoutchouc and Guttapercha Co. propose to hold a prize competition for the removal and refitting of Continental motor tyres.

Messrs. R. L. Jepson, Limited, has been registered with a capital of £2,000, to acquire any land and buildings in Blackburn or elsewhere, to manufacture and deal in motor-cars, etc.

The Parsons Non-Skid Company have come to an arrangement with United Motor Industries, Limited, to make their Coventry house the Midland fitting depot for their non-skids.

The Watkins Patents Syndicate, 157, Fenchurch Street, London, E.C., inform us that they have been appointed British agents for the Caron low-tension ignition device illustrated in our issue of the 28th ult.

One of the New Two-ton Petrol Lorries built by the Lancashire Steam Motor Company, Limited, and loaded with 30 cwt. on its Platform, drawing one of the Leyland 4-5-ton Steam Wagons, having a tare of 4 tons 12 cwt. 3 qrs., up a gradient of 1 in 12.

The Belgrave Garage, Limited, have opened a branch depot in the High Road, Chiswick, where attendance will be given to motorists by night as well as day.

The exhibition at Turin, Italy, was closed on Sunday last. There were about eighty exhibitors, and a notable feature was the rapidly-increasing number of Italian motor-car builders.

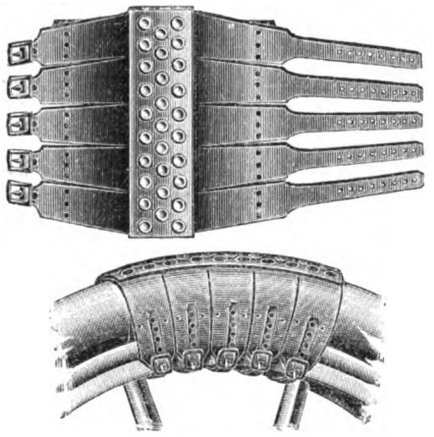
A public service for the transport of both passengers and goods is about to be established between Oloron and Jaca, Spain. A number of Turgan steam vehicles have been ordered for the service.

At a meeting of the Glasgow University Engineering Society, held at the James Watt Laboratories, Mr. T. Murray Blackwood has been reading a paper entitled "Some Details of Albion Motor-cars."

Messrs. Atkinson and Griffin, of the Westmorland Garage, Kendal, have been appointed sole agents for the county of Westmorland by Messrs. Darracq and Messrs. Clement-Talbot.

At the annual general meeting of Friswell, Limited, held last week, a dividend of 10 per cent. was declared on the ordinary shares and 6 per cent. on the preference. £3,733 4s. 6d. was written off the goodwill account, and a large sum was carried forward.

An interesting staff ride, conducted by Brigadier-General P. Campbell, has been carried out in the neighbourhood of Brighton, at which Captain A. Booth Hearn and Messrs. F. J. Frost and A. R. Garnett, of the Motor Volunteer Corps, were engaged.



Hitherto the Welsh daily papers have been unobtainable at Brecon until noon; now, however, through the agency of the Cardiff Automobile Company, they are delivered in the town at 6 a.m. The distance between Cardiff and Brecon is 44 miles, and the car employed on the work is one of 9-h.p.

As a heavily-laden motor-wagon belonging to Messrs. Evans and Evans, Erith, was proceeding up a steep incline in High Street, Erith, the other afternoon, the brake failed and the machine became unmanageable. The wagon immediately rushed backwards down hill and ran into an old disused building.

From the Albon Motor-Car Company, Limited, comes a copy of the 1905 catalogue of Albion cars, which is one of the most interesting productions of its kind we have so far this year received. Not only are various forms of pleasure cars and public-service wagonettes depicted, but a very complete description of the Albion 16-h.p. *chassis* is given, accompanied by illustrations of the many Albion features, such as the Murray governor, magneto, carburettor, change-speed gear, etc.

Digitized by Google

Mr. Ernest H. Hill, of the Beta Works, Sheffield, has sent us a sample of a new gaiter and non-skid attachment he has lately introduced for use in connection with motor pneumatic tyres. The Coupe motor tyre shoe, as the attachment is known, is destined to fit over a weak or burst place in a tyre, and so enable the latter to be run after it would otherwise be useless. It is also arranged for use as an anti-skid attachment, so that by carrying three or four of the shoes a motorist may be

prepared for either bad weather or a burst. The gaiter is made of best chrome leather, the tread being fitted with steel studs. It will also be noticed from the illustration that a triangular indiarubber piece is fitted to each strap, the purpose of this being to keep the tread in position, also to keep the tyre in place in the event of the bead becoming detached. The gaiter is made in a range of sizes suitable for tyres of from 65 to 120 mm. We may add that the gaiter has been subjected to a lengthy practical trial ere being put on the market.

Mr. Frank Little has read a paper on "Petrol Motor-Cars" to the members of the North-East Coast Institute of Engineers and Shipbuilders at Newcastle.

Mr. J. Johnson is establishing a plant for the repair of motor-cars at Priestpopple, Hexham, Northumberland. Garage accommodation for a number of cars will also be available.

Messrs. R. Reynold Jackson and Co. are making a clearance of their 1904 cars by auction at the Motor House, Euston Road, N., in order to make room for large stock of 1905 cars. Spare parts for last season's cars can still be obtained from Messrs. Jackson.

The new firm, Mors Limited, are just opening their new premises at 55, 57, and 59, Shaftesbury Avenue, London, W., for the sale and repair of Mors cars and accessories. They have also taken up the agency for the electrical vehicles of the Compagnie Francaise des Voitures Electromobiles.

We learn that Messrs. Cooke and Wade, of Cutlers' Hall, Sheffield, are putting on the market two types of "Norfolk" cars with two and four cylinders, and two systems of transmission, viz., live axle and chain. We understand that the cars comprise a number of special features which have been subjected to practical tests during the past few months.

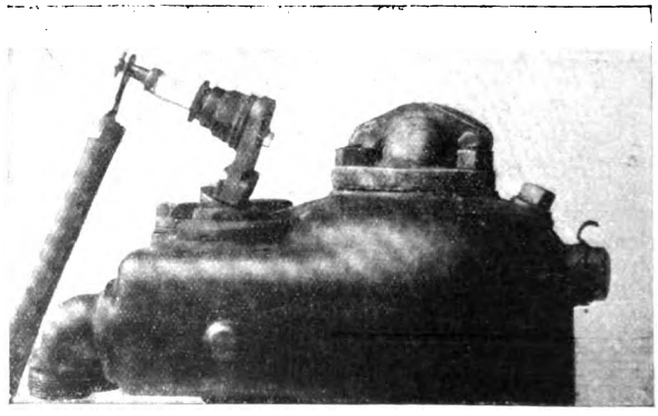
Messrs. Thornycroft have instituted a motor service between Farnham and Haslemere. Two trips each way will be made in the course of the day, the journey occupying nearly two hours. The 'bus will call at several villages, and will pass over Hindhead, thus tapping a large residential district which is entirely untouched by any railway system.

The Continental Caoutchouc and Guttapercha Company are bringing out a solid tyre on the cross-wire principle, which construction has proved so eminently satisfactory in the United States, as well as on the Continent. The tyres are made in sections of 2½ in., 3 in., 3½ in., 4 in., 5 in., 6 in., and 7 in. The 7 in. tyre is suitable to carry 8,000 lbs. per axle. Up to the present the tyres have had to be fitted at the works in Hanover, but arrangements are being made to have them fitted in London in future.

The Earl of Shrewsbury and Talbot has notified Mr. John Newton of his intention to open the forthcoming Manchester Motor Exhibition on February 24th.

At a meeting of the Manchester section of the Institution of Electrical Engineers last week Mr. V. H. Mahler read a paper on the "Electrical Equipment of Automobiles."

A luncheon to commemorate the issue of the Heavy Motor Car Order by the Local Government Board will be held by the Motor Van and Wagon Users' Association at the Hotel Cecil, Strand, W.C., on Tuesday, March 21st, 1905, during the week of the Motor-Car Exhibition at the Agricultural Hall, N.



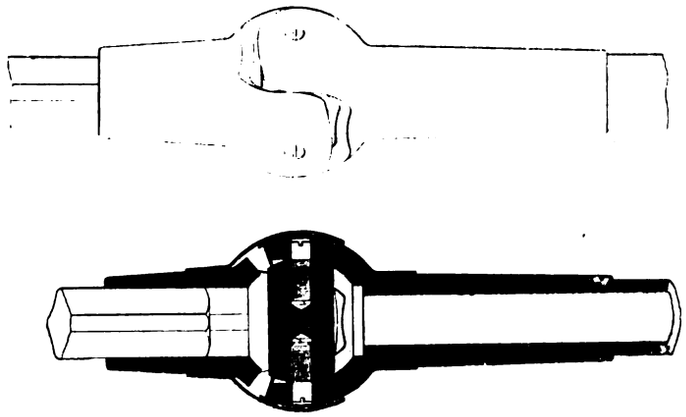
The London and Parisian Motor Company, Limited, has been registered with a capital of £16,000, to take over the business of agents for and dealers in motor-cars carried on by Captain B. D. Corbet, and the premises recently acquired by him at 58A, South Molton Street, W., and to adopt an agreement with the said vendor.

Motor-rail-cars commenced running on the Calne branch of the Great Western Railway on Wednesday. A rail-motor-car will run a daily trip from Chippenham to Bath and back. There is a motor-'bus service between Calne and Marlborough, so that it will be possible to accomplish the journey from Bath to Marlborough and back by motor vehicles.

The Paddington Borough Council is organising a deputation of representatives of the City Corporation and Borough Councils to wait upon Mr. Walter Long for the purpose of pointing out the serious effect which the new regulations for heavy motor traffic will have upon the roads and traffic throughout London, and to ask for an amendment of the same.

The Clyde Cycle and Motor-Car Company, Limited, Leicester, have sent us a copy of the new catalogue they have just issued. It gives full particulars of the Clyde 7-h.p., 8-h.p., 10-12-h.p., and 12-13-h.p. cars, the Clyde 6-h.p. Tri-carette, and 3-h.p. and 3¼-h.p. motor-bicycles, illustrations of each type being also included. An interesting page is that which depicts the evolution of the Clyde light car, the 3-h.p. air-cooled vehicle of 1899 contrasting strangely with the modern vehicle.

From Messrs. Williamson and Co., of Clonmel, Ireland, we have received a sample of a sparking plug inspector which they have just introduced, and of which we give an illustration herewith. This useful device, which is due to Mr. W. P. Burke, of Fethard, is so simple that one wonders no one has thought of it before. To test a sparking plug the usual way is to lay it on some part of the engine, so that the "earth" circuit may be completed, and the general experience is that the plug falls



down, frequently damaging the porcelain. This is obviated by the inspector, which consists of a small brass piece, threaded at one end, so that it may be screwed into the plug hole in the cylinder head; the upper end having a threaded hole into which the plug can be fixed and its operation tested without any danger of its falling, or of the motorist receiving a shock. The inspector, which is sold at a moderate price, will be found a most useful addition to the tool-box.

THE OLYMPIA MOTOR-CAR SHOW.

BELOW we commence our report of the motor-car exhibition now in progress at Olympia, London. This will be continued in our next few issues, and will deal with all the main features of interest and novelty in the display.

The HOZIER ENGINEERING COMPANY'S stand consists of a granite arch supported by pillars, set off with stags' heads and claymores and also decorated with flags. The exhibit itself consists of five cars and a *chassis*. One of the former is a 10-12-h.p. two-cylinder vehicle fitted with an Aster engine and a handsome side entrance body painted and

Figs. 1 and 2.—Elevation and Sectional Views of Argyll New Universal Joint.

trimmed in carmine, built of pressed sheet metal. We learn that the engine has been re-designed by the Aster Company in consultation with the Hozier Company in order to better fit it to the requirements of this popular type of car. The most striking alteration is in the arrangement of the cylinders and valves: separate castings are employed and the inlet and exhaust valves are arranged on opposite sides. A central bearing has been introduced between the cranks and longer and larger bearing surfaces provided. A new method of bolting the crank shaft journals is also employed,

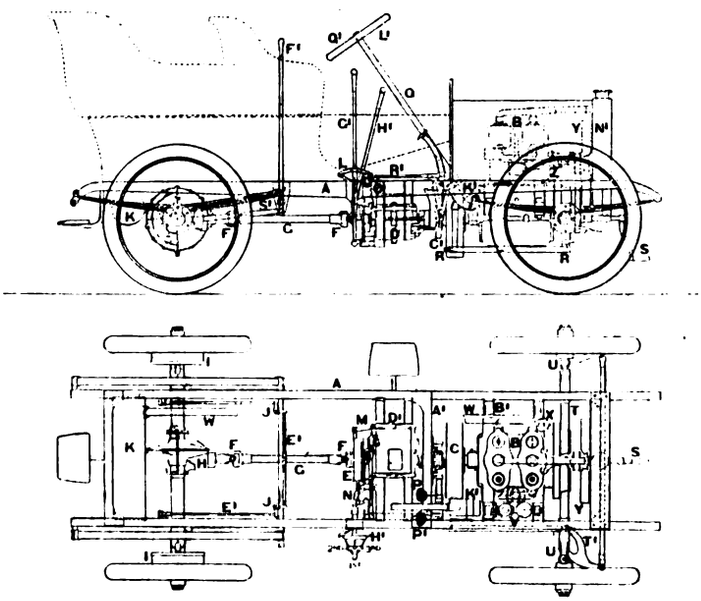

Fig. 3.—Elevation and Plan of Chassis of Argyll 10-12-h.p. Car.

rendering the whole engine much stiffer and even more silent running than previously. The water spaces around the cylinders are greatly increased, and the diameter of the valves is much larger than before. The commutator is no longer on the end of the cam shaft but is in a much more accessible position, being driven by a small shaft lying at about 45 degrees to the vertical, and bevel gear.

The thermo-syphon system of cooling is still a feature of this car, but the type of radiator has been changed. Not being altogether satisfied with last year's cooler, the Hozier Company have been experimenting with a number of novel arrangements, and as a result they have adopted an entirely new form of honeycomb, the feature of which is the section of the tube used; this is hexagonal at the ends and like a cross in the middle, a large cooling surface being in consequence obtained, combined with free circulation for the water. The radiator can be employed either for natural or pump circulation as desired. In order to obviate any chance of leakage due to springing of the joints as a result of road shocks, the radiator is carried in a cradle between the frames and is supported on a bed of soft material which deadens the shocks and prevents the radiator being strained.

To faciliate the cooling of the water a fan is placed behind the radiator, built up of six aluminium blades set on a brass centre; it is driven by a belt working on pulleys of large diameter. The spindle on which the fan is mounted is carried eccentrically and so arranged that the belt can be tightened by simply turning the spindle round and clamping it.

The well-known Govan change-speed gear, which is still fitted, has been improved in certain details. The change-speed levers have now a serviceable looking knob in place of the button which used to be fitted, and a ball bearing has been introduced into the gear-box to lessen the friction when running on the low gears. We note that the common form of pin joint for the control levers leading to the carburettor, commutator, etc., have been discarded and a neat form of ball and socket joint substituted; this greatly simplifies the arrangement of the levers and reduces their number to a minimum. The steering of the car is effected by a triple threaded screw turning in a phosphor bronze nut, the whole being encased and working in thick oil or grease. The front axle has been redesigned, the swivels being now carried between the jaws of a cast steel fork at either end of the curved and braced tube which forms the axle. A ball bearing is introduced in the swivels to allow of easy steering. The rear axle, which is substantially the same design as in last year's cars, runs on roller bearings. The road wheels are built on a new principle, which has already been illustrated in the *Journal*, the point aimed at being great lateral strength, so as to be capable of resisting the strain caused by side slips, etc. To achieve this the spokes

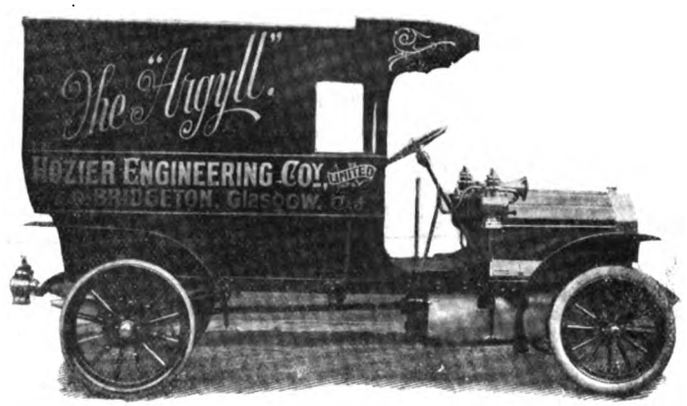

Fig. 4.—The Argyll Delivery Van.

are "staggered" in the vertical plane, alternate spokes passing to the right and left sides of the iron hub. Besides the brake on the main speed shaft operated by a pedal, hand actuated brakes are fitted to the driving wheels; these consist of large drums, forming part of the wheel hubs and containing an expanding bronze shell. The brake is operated by the hand lever acting through a compensating gear on a powerful toggle, arranged so as to give a long travel and consequent large clearance when off, and yet a very powerful grip at the point of application. The front road wheels run on ball bearings, of the now well-known D.W.F. type. A two-cylinder landaulet, painted and trimmed dark blue and gold lines, is also shown; this is a handsome and comfortable carriage well suited for the use of medical and City men. The three-cylinder car shown is of 12-14-h.p. The engine, an "Argyll," has vertical cylinders 90 mm. bore 120 mm. stroke, and runs at a speed of 1,100 revs. per minute. The car itself is a detachable Roi des Belges tonneau. The wheel base is 7 ft. and the track 4 ft, 1¼ in. The engine, which is of compact design, is provided with a centrifugal governor acting on a delicately-balanced double-beat throttle valve. The water circulating pump is of the centrifugal type, driven through gear at the same speed as the crank shaft, and is so placed as to be easily detached if required. The engine is hung direct from the pressed steel frame by brackets cast on the crank case. Probably the most popular improvement made in these cars is the clutch; the metal and leather type has been abandoned for the three and four cylinder Argyll cars and a new metal-to-metal clutch adopted. This clutch, which is encased in the flywheel and runs in an oil bath, consists of a series of discs of steel. The alternate discs are notched along the outer and inner circumferences. The one set of discs engage with projections within the flywheel, while the alternate set mesh with ribs or keys on a boss on the gear shaft. The plates are kept in contact by a coil spring. The action of the push pedal in disengaging the clutch is to overcome the pressure of this spring and allow a set of small springs between the steel discs to free the plates from each other. The advantages

Digitized by Google

claimed for the arrangement are:—(1) Great gripping power; (2) large wearing surfaces, kept well lubricated; (3) the motion is imparted to the car without any shock; (4) the clutch can be allowed to slip any amount that may be wished, a valuable feature, as it allows of the car being driven quite slowly with the engine running at its normal and the top gear in. This is especially convenient in traffic, for as low a speed as a mile an hour can, it is claimed, be got if required without changing gear. The general features of this car are the same as those described on the two-cylinder vehicles.

A 16-20-h.p. side-entrance car painted and trimmed dark green, lined primrose, is also to be seen. This is a very quiet running and fast car and also an excellent hill climber; it has a new pattern back axle, allowing of half the aluminium case being taken off for inspection without taking out the whole back axle. A new and much heavier front axle has also been fitted, a metal-to-metal patent clutch as previously described is provided; the operating levers are provided with ball and socket joints throughout. The engine has four-cylinders, 88 mm. dia. by 130 mm. stroke, with mechanically-operated valves. The steering gear is of the same design as in the other cars already described.

During the coming season the Hozier Company are to manufacture a four-cylinder touring car of 20 24-h.p. fitted with an Argyll engine having cylinders 95 mm. bore and 130 mm. stroke. The wheel base of the vehicle is 9 ft. 3 in. by 4 ft. 6 in. track, which allows of a very roomy side entrance body being fitted. A splendidly finished *chassis* is shown on the stand. All the best points in the design of their other cars have been incorporated as well as some features peculiar to this type. The pressed steel frame follows the design peculiar to Argylls. It is of an inverted U section, deep in the middle and tapering towards the ends. It is stiffly braced by heavy-shaped cross bars, the ends of which are carried out so as to give a substantial fastening and prevent any twisting action. On this *chassis* is shown a new cardan shaft joint, Figs. 1 and 2. This consists of two steel sleeves, one keyed to the driving and the other to the driven shaft; each sleeve ends in a double prong, the edges of which take the form of epicycloidal teeth, the teeth being parallel to (instead of, as in a gear wheel, at right angles) the axles of the shaft. These teeth, when meshed together, form a hollow sphere; inside this is placed a ball to keep the teeth in proper relative positions, while the whole is covered by a dust cap. The action of these is stated to be very sweet, the teeth rolling on each other when the cardan shaft revolves.

The back axle has the same general appearance as that fitted to the 1904 Argylls, but it is so arranged as to permit of its being opened out without removing it from the car. This is obtained by dividing the case containing the bevel gear and differential on a horizontal plane through the centre. A large inspection door is in addition provided to allow of the condition of the gear being readily ascertained at any time.

Besides the pleasure cars the Hozier Company show a 10-h.p. two cylinder light delivery van fitted with an Argyll-Aster engine. It is designed to carry a load of 15 cwt. at a speed of fifteen miles per hour.

On the stand are also to be seen Smith's carburettor as fitted to Argyll cars and a model of the Simplex ignition, both of which have already been illustrated in the *Journal*. Altogether, the Hozier Company are to be congratulated not only on their stand but also on the excellent cars they are now turning out, the 1905 models showing marked advance on last year's types.

In addition to a couple of their 12-h.p. double-cylinder cars, the PHŒNIX MOTOR COMPANY, of Southport, are exhibiting a new vehicle which they have named the "Barcar," and which comprises a number of special features, particularly as regards the motor. The side members of the frame are built of square section steel tubing, with rear cross stay of channel steel. The engine, which at a speed of 1,000 revolutions is stated to develop 10-h.p., has three cylinders in line, cast together. The first and third cylinders are 3½ in. diameter by 3¾ in. stroke, and work in the usual manner. The central cylinder is 4½ in. bore by 3¾ in. stroke, and is actuated by the exhaust gases from the other cylinders, its crank being set 90 degrees in front of the others. When the first cylinder has finished its firing stroke its exhaust valve admits the burnt gases, which still have some pressure, into the middle cylinder, the piston of which is then at the top of its stroke. This piston is thus driven down, and on returning sweeps the gases out into a long tube which passes to the rear of the car. The central cylinder next receives the exhaust gases from the third one, and descends as before, sweeping the charge into the air on its return stroke. Thus the middle cylinder receives an impulse every revolution, and the three cylinders act like a four-cylinder motor. Owing to the relatively large size of the central (or low pressure) cylinder, the exhaust gases expand and lose their velocity before passing into the air, and it is found that there is no need for a silencer to be fitted. The two outer cylinders have mechanically operated inlet valves worked by a separate cam shaft, and are on the opposite sides of the cylinders to the exhaust valves, which themselves serve as inlet valves for the middle cylinder. The mixture is furnished by a Brown and Barlow carburettor, and the ignition is by accumulator and coil, the commutator being mounted on the dashboard and chain driven. The water-cooling is effected by a gear driven pump and straight tube radiator with forced fan draft. The engine is controlled by a throttle on the admission, the lever for this, as also the ignition lever, being conveniently placed on the steering wheel. The clutch is of the all-metal external-contracting type with automatic adjustment. The gears, which are controlled by one lever, give three forward speeds and a reverse with direct drive on the top speed. From the differential shaft the power is transmitted to the rear road wheels by side chains. The foot brake, which, like the clutch, is worked by a push pedal, is of a special disc type. The hand-applied band brakes on the rear road wheels are of the ordinary type with two to one lever; both brakes work equally well either forwards or backwards. A novel feature of the vehicle is found in the fact that under the motor, clutch, and gear-box extends a large aluminum casing, cast in one piece. This is accurately fitted to the frame, so that when the bonnet and a cover plate of special material are in position, the whole is cased in and protected from dust and dirt. There being no other closed boxes inside this case, everything is readily accessible for examination or adjustment. All the bearings are ring lubricated, except those on the differential shaft, which is fitted with roller bearings, these carrying sufficient grease for twelve months' running. The car, which is a most interesting production, has a wheel base of 7 ft. and a track of 4 ft.

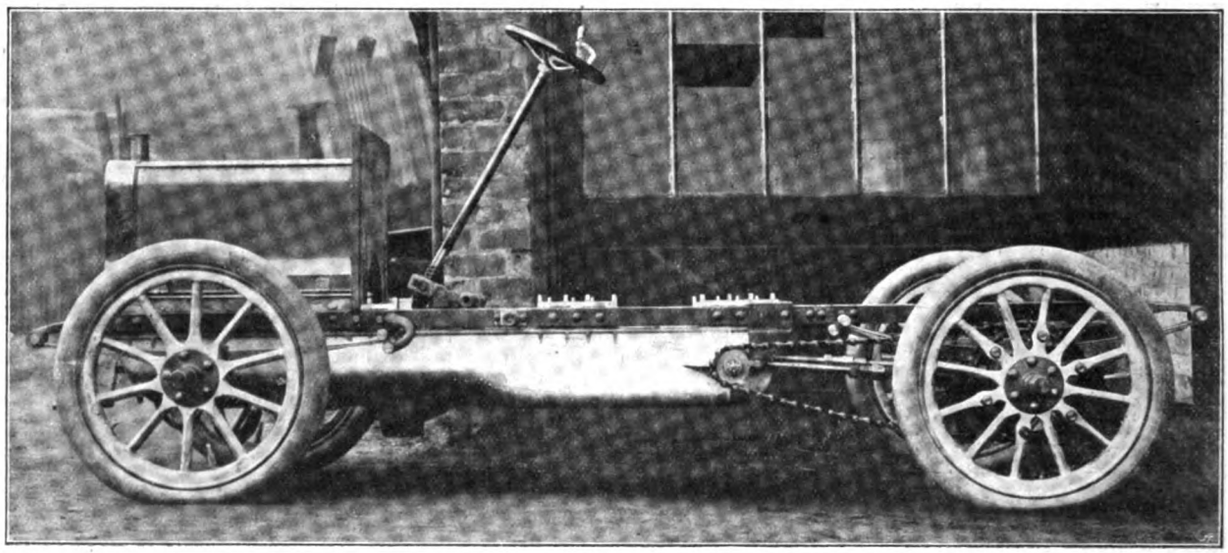

Fig. 5.—The Chassis of the Phœnix Motor Company's "Barcar."

Messrs. J. I. THORNYCROFT AND COMPANY, LIMITED, have two separate stands devoted to motor vehicles. One comprises a display of the Thornycroft pleasure cars, which we shall deal with in a subsequent issue; on the other are to be found examples of the latest types of steam and petrol commercial vehicles. One of the former is a five-ton steam wagon. In general this is similar to the Thornycroft four-ton vehicle, which is now so well known as hardly to need description, but differs from it in that it is fitted with a locomotive type of boiler of special design, and arranged to be fired through a hole in the crown. The engine also is about 50 per cent. more powerful, and will develop, we are informed, nearly 30-h.p. on the brake. The vehicle itself is of course strengthened, as requisite, for the greater load it is designed to carry, but nevertheless is built to comply with the new

Digitized by Google

Local Government Board regulations as to weight. This vehicle is also capable of drawing a further two and a half tons on a trailer, making a total paying load of seven and a half tons.

The double-deck omnibus exhibited is one of twenty-five which the company have on order for different omnibus companies. It is propelled by an internal combustion engine of the Thornycroft Company's own design and construction, and developing 24-h.p. on the brake. Between the engine and the gear-box is a fly-wheel the arms of which are formed so as to act as an air-inducing fan, combined with a lubricated multiple-disc clutch. The gear-box provides four speeds ahead and one reverse, all operated by one lever, and giving a through drive on the top gear. The motion is communicated to the road wheels by chain transmission with spring drive. The top speed with the engine running at its normal rate is ten miles per hour, and seating accommodation is provided for sixteen people inside and twenty out. A petrol wagon intended for two-ton loads is also to be seen, the body provided being suitable for mineral water or bottled beer delivery work. The four-cylinder engine is of 20-h.p., and is of the type similar to that fitted in the Thornycroft pleasure cars. The clutch and gear-box are also similar to those fitted in the latter. The four speeds forward and reverse are all operated by one handle at the driver's seat. The transmission of power to the back axle is by means of a Renold roller chain. There is also exhibited on this stand a special petrol-driven "Vanette," built to the order of the British Vacuum Cleaner Company, Limited. This vehicle is propelled by one of the Thornycroft standard petrol engines of 20-h.p., and carries another petrol engine, used for driving the pumps necessary for working the vacuum cleaner apparatus. The whole vehicle is self-contained, and forms a neat and handy machine for the purpose for which it is intended.

On the stand of M. Andre A. Godin is the Dinin plug, to which we referred a few weeks ago. Its feature, which will be apparent from the accompanying illustration of the porcelain sparking plug, is the curved shape of the top, on which the word Dinin is printed in a hollow bell. Being supported from the hexagon nut, the insulation is practically perfect. This plug has also the advantage of firing under any compression, and cannot be affected by the oil or any dirt in the cylinder. If any soot was intercepted between the two terminals, the spark would jump from the rounded head to any other part of the curved wire. Under these conditions, oil or soot never affect the perfect working of this plug, which is delivered to the trade in a wooden box with a lead seal, so that the buyer is always certain of getting a plug which has not been used before.

The Mobile Motor and Engineering Company, Limited, have an interesting range of "Mobile" cars extending from the popular 6-h.p. to a powerful 24-30-h.p. four-cylinder car. The latter is fitted with a four-cylinder "Aster" engine with mechanically-operated valves, Longuemare carburettor, pressed steel frame, three speeds forward and reverse, and chain drive. It is equipped with a handsome body with side door entrance and Cape hood. The body is finished in a new colour, styled in France as "dead leaf."

Of the 10-12-h.p. "Mobile" a *chassis* is exhibited; this is fitted with a 10-12-h.p. Aster engine, 88 mm. bore by 140 mm. stroke, being mechanically actuated. The *chassis* is of steel, strengthened with ash, and the radiator is placed very low in order to allow the maximum of cooling. The change-speed gear is of the Panhard type, giving three speeds forward and a reverse, the transmission being by cardan shaft and bevel gear to a live axle. The differential is specially strengthened by two side stays and a new spring stay, connecting the differential with a cross bar on the frame, the latter considerably reducing the vibration due to uneven roads. The lubrication is effected from the dashboard; the bearings on the differential and gear-box are supplied with grease through a grease pump, while the oil lubrication to the differential gear-box and crank chamber, as well as the two to one gear, is effected automatically by exhaust pressure. The band brakes on the rear wheels are of a powerful type, and are so arranged that they may be easily detached. The clutch is of the metal-to-metal type operated by push pedal, and the throttle and advance spark levers are arranged on the top of the steering wheel.

The next car is a 8-10-h.p. double-cylinder car with Aster engine, 88 mm. bore by 120 mm. stroke, built exactly on the same lines as the 10-12-h.p. car. One of the 8-h.p. cars with four-seated tonneau body and De Dion engine, which attracted so much attention at the Reliability Trials at Hereford last year, is also on view. The *chassis* is exactly the same as the 8-10-h.p. car, and is, in fact, a reproduction of the latter with the exception that it has a single-cylinder De Dion engine. The tonneau is very roomy, painted in green, and upholstered in real green padded leather.

The cheapest car on the stand is the new 6-h.p. "Mobile" car with side door entrance and genuine De Dion engine. The vehicle is provided with automatic lubrication and forced grease pump. The *chassis* is of armoured wood and will undoubtedly attract attention on account of the neat design, the general appearance of the vehicle being that of a small racing car.

The exhibits of the United Motor Industries, Limited, include several new models of the "Castle" accumulators which did so well in 1904, and some new models of the "Castle" acetyloid lamps, including the motor-launch set with head light and port and starboard lights. They also show Alpha lamps, an apparatus for preventing injury from back firing, Century belting for motor-cycles and chrome leather for making non-slipping bands, the 1905 Cremorne paraffin carburettors, "Castle" high tension magneto without coil, a new lubricating oil known as "Castle" Monogram, new pattern "Castle Mulliner" hand shield, invented by Mr. H. J. Mulliner, and a general selection of automobile accessories.

The well-known "Salsbury-Flare" lamps, together with the "Salsbury-Searchlight," "Salsbury-Ovalite" and "Salsbury-Dietz" lamps are exhibited by Messrs. Salsbury and Son, Limited. Lamps with separate generators seem now to be a fashionable design, and in these a number of patterns are shown together with the new compound Duplex Lens, which, although only introduced about three months ago, has already become popular with the motoring public. Salsbury-Barrett jacks, Salsbury horns, sparking-plugs, accumulators, Dazlit Metal Polish, and Gre-Solvent all find a place on this stand. Messrs. Salsbury have also introduced a special "one-piece" dioptric lens which gives results almost equal to the well-known lenticular dioptric lens in three elements. It has the great advantage of being less liable to breakage and very cheap to replace in the event of becoming damaged. As agents for the Simplex ignition plug Messrs. Salsbury are exhibiting this plug in working order, and motorists will be well advised to inspect this excellent device.

Messrs. Weldhen and Bleriot have a fine show of motor lamps and horns. Besides their Bleriot projectors, "Eclaireur Elliptique" head lights and other equally popular patterns, they are exhibiting catadioptrique projectors for motor-cars, motor-boats, and yachts, as well as their 1905 patterns of self-contained head lights and projectors or faces for separate generators. These new Bleriot lamps act as head-lights and projectors, illuminating the road right in front of the car, and also far ahead, making driving at night as safe as in daylight. The "combined spherique and parabolique" reflectors are made of solid rolled silver on copper, completely isolated from the flame by a patented unbreakable glass chimney maintained in position by light springs, and will therefore never require any polishing, all the fumes being carried right away. Each lamp is fitted with an improved filter and expansion gas chamber. The new "auto-generator" which is used with these lamps is a simple acetylene gas generator, and is absolutely clean at all times.

The Sirdar Rubber Company, Limited, are exhibiting their specialities in tyres and wheels made of cleft-oak, with hickory half rims, for all vehicles from the lightest voiturettes up to 6½ ton motor-omnibuses. On the latter they fit their new large twin 5 in. Endless Royal Sirdar-Buffer tyres to the driving wheels, and single 5 in. tyres to the steering wheels. They also exhibit the 2½ in. voiturette tyres, and 3 in. and 5 in. high-speed section for heavy large touring cars, in addition to the carriage wheels. The Sirdar Rubber Company, Limited, have converted the tyres of over 1,500 cars, and are doing much to popularise solid tyres with all classes of users.

Messrs. S. Stevenson and Co., Glasgow, who make a speciality of artillery wheels for motor-cars and heavy steam wagons, as well as mahogany and walnut covered steering wheels in gunmetal and aluminium, show a good selection of such specialities. The firm have contracts running with several of the leading motor-car manufacturers for their whole supply during 1905.

(To be continued.)

From "Le Carbone" comes a list of the "Steady" re-chargeable ignition cells, in the design of which the object has been to combine the maximum output with small dimensions. The E.M.F. of the cell is from 1·55 to 1·6 volts and the output of the voiturette type on short circuit is from 22 to 25 amperes.

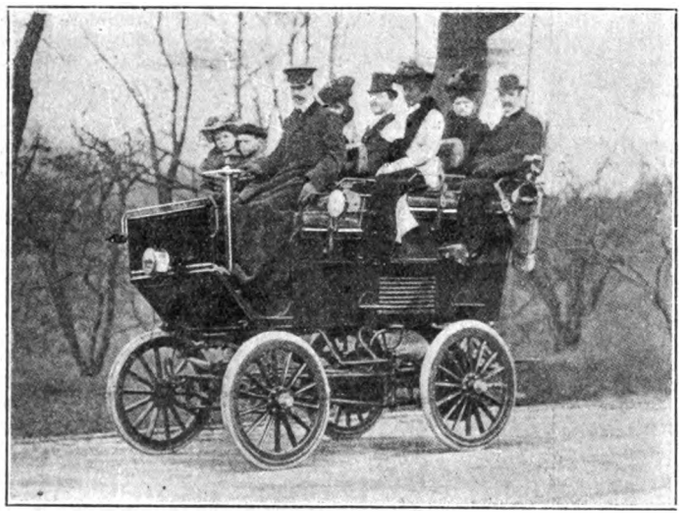
Messrs. J. Liversidge and Son, Limited, have issued an artistic and useful price list of the De Nevers patent grooved solid tyre, which, it is claimed, secures a maximum of resiliency without the risks that pneumatic tyres have to encounter on the roads. The principle of construction is to cut a number of grooves in a solid tyre, which thus becomes, in effect, a series of rubber balls on the rim of the wheel. The grooves secure a good grip of the road without the danger of side-slip, and also take up all elongation, a fact which should make them a matter of interest to owners of all types of cars.

The Alden Speare's Sons Company, of East Cambridge, Mass., U.S.A., have sent us samples of a new non-freezing mixture they have lately introduced. The mixture, which has an oil base, is intended to be used instead of water for cooling water-cooled motors during the winter months. It is stated to have remained liquid at the extreme temperature of 18 degrees below zero, and is practically non-freezable. It cannot, it is claimed, injure the tank or the cylinders, and is about as thin as water, so will circulate very readily. The same firm also manufacture a liquid polish for cleaning the bright parts of motor-cars.

Digitized by Google

CORRESPONDENCE.

[*Letters to the Editor should be addressed to the offices, 27-31, Charing Cross Road, London, W.C.*]



TO MOTOR-CYCLE MAKERS.

To the Editor of *The Motor-Car Journal.*

Sir,—In connection with the second International Cup race for auto-cycles, to be held in France in June next, it is suggested that a special fund be opened, within the limits of which the Auto-Cycle Club will offer to defray, year by year, the expenses incurred in connection with the contest by the makers of the English machines, and by the representatives of England, so that when a maker has built his machine and has successfully gone through the eliminating trials, he may be relieved of further expense.

One eminent manufacturer has kindly given a sum of one hundred guineas to the fund, and he suggests that the matter be laid by the Club before the motor-car manufacturers and others interested in this country, and that they be asked to give their support to the fund on the ground that it would be to the advantage of the whole of the industry in this country if England should win an International automobile event. It may fairly be argued that English motor-car manufacturers should help in the endeavour to win the International Cup, as the fund will effectively be the basis of substantial prizes, which will make the selection trials a matter of wide-spread interest and will turn public attention to, and enlist sporting interest in motor-cycles in a manner better calculated to advertise the movement than perhaps any other steps which could be taken.

It will generally be agreed that England at least stands a very good chance of winning the trophy, because, without question, the British made motor-bicycle is second to none, and with the preliminary long distance race (to be held in all probability in the Isle of Man in May), the riders will secure the practice in manipulation and in travelling at speed which are so essential to success.

A Novel American Electrical Coach.

For the club to undertake this most desirable task of defraying the whole of the expenses (and thereby encouraging motor-cycle makers to build machines specially for the event), responsibility for a heavy expenditure will be incurred and some hundreds of pounds will be needed. The Committee of the Club has decided to vote the sum of twenty-five guineas to the fund, and we shall be glad to be favoured with contributions.—Yours truly,

H. C. L. Holden, President Auto-Cycle Club.

DELHI-BOMBAY TRIALS.

To the Editor of *The Motor-Car Journal.*

Sir,—In view of the various statements which have appeared in connection with the above trials, and particularly in regard to the awards of the judges, the extracts set out below from a letter received from Mr. W. Sorel, the owner of the De Dietrich car which won the trial and the Gaikwar's Cup for reliability, will be of interest. "After the results were given out a protest was signed and sent to the judges against the De Dietrich car, as she had actually lost a few marks. The matter was again reconsidered but the award maintained, as no repairs or readjustments had been made on my De Dietrich car after leaving Delhi until arrival in Bombay, whereas all the other cars had been worked on, and the engines and other parts readjusted beyond the two hours allowed for cleaning and lubricating. The De Dietrich was consequently considered by the judge to have been the most reliable throughout the run. The only troubles I had during the 880 miles were, first day, the little pipe leading from pump to water manometer broke and I lost all the water and had to wait twenty-one minutes for coolies to bring water to replace. In the same afternoon an ignition tappet spring broke and was replaced in four minutes. Fifth day, bad tyre troubles, otherwise non-stops the whole of the time. The running of the car was greatly admired."

In the view of the fact that it was suggested that some special favour had been shown to the De Dietrich in the awarding to it of the prize, it will be observed that all the points raised in the other competitors' letters were carefully reconsidered by the judges and the award was made to the De Dietrich beyond all question on absolute merit, and after having proved itself the most reliable car.—Yours truly,

Charles Jarrott and Letts, Limited.

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

To the Editor of *The Motor-Car Journal.*

Sir,—From "Electrical Engineer's" remarks in the last issue of the *Journal*, it is perfectly evident that he is in favour of magneto ignition, and consequently condemns every other method. I have two cars fitted with the best magneto device obtainable, but would be sorry to go a hundred miles without my accumulators, as my magneto ignition has several times left me stranded. This has been confirmed by many of my motor friends who have also both forms. Of the two, the electrical ignition is by far the most reliable, although the magneto may in some cases be all right if the owner understands a constant repair of the parts when necessary. As regards the charging with primary cells, I am a very old user of these, having obtained a set of Boron cells as far back as five years. I have a dynamo running on the premises, but get far superior results from my cells. I can easily charge a 4-volt accumulator perfectly in eight hours, and of 35 amp.-hr. capacity, for the small outlay of 2d., or a 40 amp.-hr. one for 3d., which, when sent out to be charged by supposed qualified electricians, often came back only partially charged, or not unfrequently with the plates ruined and in addition a charge of three times the previous outlay. In conclusion, I would state that I have found the Boron cells perform in a trustworthy manner all that is claimed for them, and, if used in accordance with the instructions, give far more economical results than any other method.—Yours truly,

H. C. Townson.

CLEAN HANDS.

To the Editor of *The Motor-Car Journal.*

Sir,—I notice occasional inquiries as to the best method of removing grease from the hands, and that several motorists have recommended oil, soaps, etc. The method I employ may therefore be of interest. I use oil and clean waste to take off the thickest of the grease, then soap the hands well and put on a teaspoonful of granulated sugar. This makes a fine lather which will start almost anything and will not hurt your hands. If your grocer mixes much "sand" with his sugar, this will scratch off the rest of the dirt and grease, so they will be clean. The method I believe worthy of a trial, for I find it is as effective as the various preparations on the market.—Yours truly,

Sticktite.

THE CARE OF MOTOR-CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—In a lengthy and varied experience with motor-cars I cannot recall anything in which users of motor vehicles are so unanimous as they are in the variety of their opinions about the same make of vehicles. Take ten owners of any given make of car and ask each one of them what he thinks of the vehicle he uses, and you will probably get ten different opinions. Granting that each of the ten is honest, and there exists no reason for him to be biased, there can be only two explanations why this wide divergence of opinion exists. Either cars of the same make and identically the same model vary greatly in their performances, or some of their owners handle them more intelligently, hence less injuriously, than others.

In nine cases out of ten neglect and ignorance—not wilful—are the causes of almost every difficulty the man possessed of ordinary common sense experiences with the car he owns, and, although they may appear at the time of their occurrence very annoying to the novice responsible for their happening, a better acquaintance with the vehicle and its construction causes later on only a laugh when the misfortunes of the owner's first experiences are brought to mind.

In all this makers should not forget that not one novice out of a hundred really knows anything about the vehicle he buys, the acquiring of an education being left to his early matriculation at the University of Experience. The seller cannot afford to supply a teacher free for any very extended period of time, nor will the buyer pay for an instructor a moment longer than it is necessary for him to acquire the merest smattering of information about the car. The results are unfortunate for all concerned; but they could not be different from what they are. Of course, before the owner cuts loose from the instructor he has been told by him perhaps a hundred things which are nothing in themselves—and attention

Digitized by Google

to which soon becomes absolutely automatic—but which become so jumbled up in the mind of the new owner that they mean absolutely nothing to him when the occasion for their remembrance eventually arrives.

Generally, all goes well with the novice, and by the time any adjustments to the car are required the tyro is fairly well up in his subject. But there are exceptions, and notable ones. I have known cases where an expert has travelled 150 miles to see what was the matter with a new vehicle, only to find that the petrol tank was empty!

I believe that, given a good car, most of the difficulties experienced by beginners are due to over-driving, unduly violent starting and stopping, neglect of adjustment, and lack of lubrication. I have seen many automobiles disassembled after various periods of running, and I believe all who have had practical experience will agree with me that the most common cause of excessive wear is neglect of lubrication. The motor itself may be perfectly well lubricated—in fact, it is too often decidedly over-lubricated—but every other part of the car is left alone. I have seen change-speed gears ruined for lack of oil, combined with violent changing, and axle-bearings seized simply because they had been run dry for long periods.—Yours truly,

AN OLD HAND.

TYRE AND NON-SKID BAND TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have motored for twelve months and wish to ask you or your readers' advice. The benefits of this delightful pastime have reduced the cost of medical attendance in my household very considerably, but the upkeep of tyres is a terrible drain upon my bank account. I have had non-puncturing, non-skidding tyres for some nine months, but in no instance have they run 1,000 miles. In every case the leather covering has become detached, not through the tread being worn, but seemingly through bad work in vulcanizing the leather cover to the canvas. It may be asserted that this only occurs through the tyre becoming deflated. I stop at once when this is detected, but already the mischief has begun, and a non-puncturing, non-skidding tyre, once deflated in running, is practically useless, and may be thrown to one side. My last experience showed that the canvas lining had burst, showing a crack of ½ in., and before I observed the position—not having run 200 or 300 yards—the leather had already begun to be detached. I am a most careful driver, seldom using brakes, tyres well inflated, best tubes, and I try to get hold of covers to run 5,000 miles, as so largely advertised.—Yours truly,

A SEEKER FOR GOOD TYRES.

NON-SKID BANDS AND SILENCERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad of any information from you or any of your readers who have had experience with the Pullman improved non-skid band with hob-nail studs, which appears to me to be a very practical one and puncture preventer. I understand, however, that the trouble with steel studded covers is that the studs come out and are of course difficult to replace when the cover is vulcanised on. I should like to know the action of water on the specially prepared leather, and also if the cover by its weight would absorb much of the engine-power, as I cannot spare any of my 8-h.p. in our hilly district. I should think they will lift a large quantity of mud. If any of your readers can recommend really satisfactory non-skids which are puncture proof besides I have no doubt others will be glad to have the information besides myself, especially if, with freedom from the above-mentioned faults, they combine a reasonable price and durability.

I should also be glad of the experience of those who have made the change, whether any improvement can be effected in an 8-h.p. De Dion, 1903 pattern, as regards silence and power, by adopting one of the advertised silencers.—Yours truly,

W. A. D.

THE EFFECT OF NON-SKIDS ON ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the interesting features of present-day motoring is the increased use of non-skids and tyre protectors. If proof of this be needed, it is only necessary to notice the number of cars equipped with some one of the many devices of the kind. As a temporary expedient—as, for example, where a tyre is in bad condition, or when a trip is to be taken over vile roads, or when heavy rains have made quagmires of the highways—tyre protectors do not seem illogical. But as a permanent adjunct, to be used always, on all sorts of roads and in all weathers, they have, at least to my mind, an appearance of incongruousness. The ordinary pneumatic tyre is turned out in what is supposed to be a complete form. A thick covering of rubber is provided to take the road contact and to protect the delicate and highly important air-containing inner tube. Tough and strong fabric also surrounds this tube and checks any tendency to burst or give way under the tremendous air pressure. Why, then, is it necessary to envelop this complete tyre in a crude and unsightly covering that does not properly form a part of it and is palpably an excrescence?

The usual answer is, of course, that the chief purpose served by a tyre protector is to prevent side slip. Almost without exception it is made with some device on the tread that bites into the road and hinders, if it does not prevent, lateral movement of the wheels. Metal in some one of a variety of forms is usually employed for this purpose, and with considerable success. The users of such appliances, however, seldom stop to think that they are doing great harm to the surface of the roads over which they drive their cars; or, if they notice it, are entirely indifferent to the fact. They do not bear in mind that the hard, smooth surface has cost a lot of time and money in the attainment, and that great injury can be done by one car; while a number of them can and will leave a road in such a condition that a new covering will quickly become absolutely necessary.

The matter is certain to attract attention before long from the authorities in charge of the maintenance of roads, and if the use of protectors becomes at all general, a crisis will be reached, and some modification of the existing non-slip devices imperatively demanded.—Yours truly,

F. L. FRANCIS.

UNIVERSAL LIGHTING IN SCOTLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I attended a meeting of the East of Fife Agricultural Society, of which I am a member, and after other business the question of universal lights was brought up by Mr. Ramage, of Ashgrove. He moved that the meeting should send a representation to the M.P. for the division, or to the Home Secretary, opposing the Bill. He brought up the old hackneyed objections, and got literally no support.

Captain Scott Davidson, of Cairnie, spoke against Mr. Ramage's motion, as he did not see how one should be compelled to carry a light, and not another. Sir Ralph Anstruther said that the meeting was called to discuss the affairs of the Society, and a question of this kind was quite outside of it. Due notice ought to have been given of its being brought up. Had this been done he was quite prepared to argue the matter, but, at the same time, he did not see why universal lights should not become general. I went myself principally to oppose any motion raised against the Bill, but, of course, did not need to say anything, seeing Mr. Ramage got no support.—Yours truly,

T. G. WISHART.

TRI-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In further reply to "Beginner," I am sure he will be best pleased, if he has a Tri-car at all, to have one on the lines I mentioned. A machine lightly built, with 3½-h.p. engine, about 3½ in. by 3½ in., will do, air-cooled and chain drive; £40 should be ample for this. If he wants to pay more he can get a light four-wheeled car, with wire wheels, two seats side by side, 4 in. by 4 in. water-cooled engine, three speeds and reverse, for £80; something similar to this but with rather smaller engine has been done at £75. The above will also explain to Mr. Adamson what I mean. His experience has certainly been exceptionally good. To do 14,000 miles on a belt-driven Tri-car is not bad, but his last year's performance of 16,000 miles, which averages over 300 miles a week, mostly through crowded streets, and professional duties as well, is marvellous.—Yours truly,

A. SAUNDERS.

WATER CIRCULATING PUMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the Correspondence columns in the *Journal* of the 28th ult. I notice an inquiry as to the makers and patentees of a small rotary circulating pump, and by the description I think they must mean one that is manufactured by the Albany Engineering Company, Goschen Street, Camberwell, S.E. Some short time back I had considerable difficulty with the water circulation on a number of small cars, and after trying several pumps I eventually fitted that manufactured by the above-mentioned firm, and was considerably surprised at the results. It entirely overcame the trouble I had with the circulation, although in size the pump was no larger, in fact, in several instances smaller than others I had tried. Its extraordinary efficiency seems to be the result of the small grooves in the teeth and the face of the wheels, which evidently forms a perfect water seal.—Yours truly,

G. J. S.

FORTY SHILLINGS COSTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue, under the list of convictions, one for driving without rear number, which was dismissed. Ten days ago I was driving up to town at 12 o'clock at night, when the commutator seized; I had to take the front number board down to repair same; this occurred again, so to avoid waste of time I left it off.

I pulled up in Wigmore Street, and was immediately charged by two policemen with driving without the identification plate in front; I explained the matter to them and replaced it in front of them and called their attention to the back number, which was well illuminated. In spite of this I was summoned to Marylebone Police Court, where Mr. Paul Taylor fined me 40s., and, of course, endorsed my licence. I had a big Alpha lamp burning in front, so it was absolutely impossible to see the number when the car was going along.

Hoping this will be of interest to some motorists.—Yours truly,

REGINALD JOSEPH.

THE A.C.F.'s PROJECTED JOINT RACE.

To the Editor of *The Motor-Car Journal.*

Sir,—I am glad to see the firm stand which the A.C.G.B.I., in conjunction with the German, Belgian, Austrian and Swiss clubs, are taking with regard to the proposal, or I should say decision, of the French Automobile Club to run the Gordon Bennett race in conjunction with its newly-projected Grand Prix event. The French claim that, owing to the larger extent of their industry, they ought to be entitled to a more numerous representation in the Cup race, can hardly be taken seriously. The object of this annual event is certainly not to give a demonstration of the magnitude of the automobile industry in the various countries, but rather to determine the quality of the automobile products of the different nations.

The decision of the French Club to hold a joint race without having consulted the other national clubs appears to me to be a most indelicate action on its part, for, large as the automobile industry of France is, it can hardly presume to dictate the conditions of international contests.—Yours truly,

Fair Play.

BUYING SECOND-HAND CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Buying a sound horse is difficult enough in all conscience, but most people must come to the conclusion that buying a good second-hand motor-car is much more difficult. There are many old pattern and defective motor-cars now on the market, and buyers must be careful. Many of these cars have been re-painted and also have had new outer covers fitted to the tyres—so that they look well. In all cases, if a vendor is not willing to give a fair trial, in a hilly country for choice, and will also

A Brillie Petrol Motor Wagon Hauling a Military Train.

give a written guarantee that the car is in good running order, the purchaser may then think of expert examination. It would be well to have a guarantee something like the following:—The purchaser may fairly use the car for a week from date of purchase. If at the end of that time any part be found defective the vendor to have the option of refunding the amount paid by the purchaser in full and taking back the car, or of having the defective parts repaired at his, the vendor's, sole expense. This guarantee not to apply to tyres, and not to, of course, cover accidents or ill-usage. Much the best plan for the novice is to buy a new car, but if he decides to buy one second-hand he will be advised to adopt the above plan.—Yours truly,

Caveat Emptor.

CARBURETTOR EXPERIMENTS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have fitted a Cremorne carburettor to a 1902 Oldsmobile car, and, on the whole, have found it very satisfactory, especially as the engine now starts at once with, perhaps, three turns, after standing a night or more, and with a single turn at any time during the day afterwards. The inlet of hot exhaust around the jacket has been partly throttled, but a few experiments seem to show that the carburettor works better on this type of engine when fully throttled and kept as cold as possible, and more power is developed. If any of your readers have had experience with the Cremorne, perhaps they would communicate the result in these columns, and users would thus be able to help one another, since doubtless each would make experiments from different standpoints. I have not yet attempted to alter the valve spring except to relieve it a little with my finger, temporarily, when the engine appeared to yield still a little more power. If anyone has tried this carburettor with ordinary petroleum, with which the makers claim it does good work, I should be glad to know how they succeeded.—Yours truly,

Sivalo.

INCREASING ENGINE POWER.

To the Editor of *The Motor-Car Journal.*

Sir,—I am thinking of placing a four-cylinder 12-14-h.p. petrol engine, 1,200 to 1,500 revs. per minute, into my 7½-9-h.p. car, which has now a Phœnix engine (two-cylinder) 850 revs. per minute. The car weighs, when loaded for the road, one ton (without passengers) and the wheel base between axle caps is six feet two inches. The car is chain driven, and the gear is of the Panhard type and unscratched, all the bearings are practically unworn, after eighteen months' careful use. I am told this would be a success by many friends and experienced mechanics, but by others that the gears are cut for certain revolutions, and the increased speed at which they would revolve with the higher power would in some unexplained way be very detrimental to the car being satisfactory when re-engined. Can you enlighten me over this perplexing question? I have had a draughtsman and a foreman fitter to measure and examine the car, and there is no difficulty in the way of converting to four-cylinder.—Yours truly,

S. H. B.

[The increased engine speed would not have any serious effect on the gears, these being just as suitable for high speeds as for low. The only great difference will be in the increased speed of the car, which, by the speed of the new engine, would work out at almost double the present rate. The question is whether the steering, length of wheel base, etc., would be suitable for higher rates, these being points that should be carefully considered before deciding upon the new engine.]

THE WHEEL BASE OF MOTOR-CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Within a comparatively few years the wheel base for motor vehicles has increased very rapidly. From rather less than five feet during the early days of the industry it has been gradually advancing until eight feet or over is not considered unusually long, and nine feet by no means extraordinary. The improvement in riding qualities which has resulted from this increase of length, due to the perceptibly increased period of time which elapses between the respective actions of the front and rear springs when meeting road obstruction, has immeasurably enhanced the comfort of motoring. Greater roominess also characterises the long modern car, which has become a veritable vehicle of luxury.

The tendency to increase wheel base is, however, not without its drawbacks. It appears to me that the manœuvring ability of cars has decreased rather than increased, as judged by the diameter of the circle in which they may be turned, and it is more than probable that further increase in wheel base may be prevented by considerations involving the large spaces necessary for the turning of excessively long cars. Upon narrow country roads, such as are frequently encountered in touring, a corner cannot sometimes be taken without using the reverse gear, while to turn round is practically an impossibility. In my opinion, the point of maximum wheel base has already been reached, and unless designers devote more attention to making the "lock" of the front wheels correspondingly greater, I think that we shall see a return to cars of more moderate wheel base length.—Yours truly,

C. F. Parkinson.

Apprenticeships.—The replies in response to the letter from "X. M." have been forwarded to that gentleman.

The Markt Mileage Recorder.—Some correspondents wish to know where the Markt mileage recorder, recently described in the *Journal*, can be obtained retail.

Responsibility re Accident.—A reader asks whether the owner of a car, used for hiring purposes, is responsible for the claims made by passengers in the event of accidents causing personal injury.

Water Circulating Pumps.—Several correspondents have written to say that the water circulating pump inquired for by Mr. S. James in the issue of the 28th ult. is made by the Albany Engineering Company, Goschen Street, Camberwell, S.E.

Oil on Brakes.—The Herbert Frood Company, of Chapel-en-le-Frith Derbyshire, write:—"We notice from time to time enquiries for an antidote for the oil that inevitably reaches the linings of band or expanding brakes, which destroys the grip. Will you permit us to mention that we are producing a cheap lining that is even more efficient when greasy than in its original state, and they wear inch for inch as long as brass."

CLUBS AND ASSOCIATIONS.

LEICESTERSHIRE.

At the annual general meeting of the Leicestershire Automobile Club last week the following officers were elected:—President, Mr. George Mawbey, M.I.C.E.; Vice-Presidents, Col. Lionel Powell, J.P., Mr. J. A. Corah, J.P.; committee, Messrs. W. Earp, H. A. Hamshaw, L. H. Hargrave, V. Oliver, H. H. Wildt, T. C. King, R. Sutton Clifford, jun., A. H. Faulkner; hon. treasurer, Mr. H. R. Harding; hon. secretary, Mr. A. McAlpin.

The annual dinner of the club was held on the 30th ult. at the Bell Hotel, Leicester, under the presidency of Mr. E. G. Mawbey, M.Inst.C.E. The company numbered about fifty. After the loyal toasts had been honoured, Colonel Lionel L. Powell, J.P., in giving the toast of "The Leicester Corporation and the Leicestershire County Council," said that in reference to those two bodies they ought to be very well satisfied and very proud indeed that automobilism was looked upon so favourably in town and county. The police were exceedingly judicious, and did not lay down traps in by-roads and in villages where there were no children. The Mayor, whose name was associated with the toast, replied. He was very pleased to hear Colonel Powell had no fault to find with the Leicester Corporation or the County Council. Leicester and Leicestershire would compare most favourably with any other county as to the good condition of its roads, and he had no doubt that this was one of those things which added pleasure to their favourite pastime as automobilists.

Mr. E. Manville, M.I.C.E., submitted "The Leicestershire Automobile Club and President." He spoke of the interest the parent body manifested in the affiliated societies, and said the importance of provincial clubs could not be overrated. It was true there were larger provincial clubs than that of Leicestershire, but he did not believe there was one a bit more important. Leicestershire was a great hunting county, and as such they respected it, but he supposed it might be assumed there was necessarily more prejudice to be found against the use of motor-cars in that part of England than in other counties not so much interested in horses. The chairman, in responding, expressed thanks to Mr. Manville for the manner in which he had submitted the toast. He saw a statement the other day that the Motor Car Act was working successfully in Leicestershire. This was attributable to the broad and generous way in which the Act had been administered by Mr. Lumley, the Chief Constable of Leicester, and Mr. Holmes, the Chief Constable of the county. They had only a few trifling cases against automobilists in Leicestershire, and he felt there was a marked diminution in the prejudice against automobilism throughout the country.

Mr. J. A. Corah, J.P., proposed "The A.C.G.B.I. and the Motor Union," remarking that the parent Society had done much good in the past. Mr. Staplee Firth responded, saying that the amount of prejudice which existed on the Bench against motorists was greatly diminishing. Mr. W. Rees Jeffreys also responded, pointing out that the Motor Union had done much to secure the mechanical efficiency of the motor-car. He paid a high tribute of praise to Mr. Alan McAlpin, the hon. secretary of the Leicestershire Club, and said they had found him a genuine worker on the General Committee of the Union. Their president, too, was also a very useful member of that committee.

Mr. H. A. Hamshaw gave "Kindred Clubs and Visitors," stating that no county had met with less prejudice so far as automobilism was concerned than Leicester, especially considering the position it occupied as a hunting centre. Mr. E. Shrapnell Smith and Mr. A. R. Atkey acknowledged the toast. The remaining toast was "The Officers of the Club," given from the chair. An enjoyable musical programme was submitted during the evening.

SCOTTISH.

At a meeting of the Western Section of the Scottish Automobile Club held last week, Mr. John Adam, Chairman of the Section, presiding, Dr. W. R. Ormandy, of Warrington, delivered a lecture on "Motor Fuels, with special reference to those of Home and Colonial Manufacture." The lecturer dealt first with the properties of an ideal fuel, such as heat contents, heat available, range of explosion, heat of evaporation, vapour tension, and the like, and passed on to a comparison of the similar properties of existing fuels. Dr. Ormandy dealt at considerable length with the economic side of his subject, paying particular attention to the question of the cost of the various fuels to individual motorists as well as to the relation existing between the fuel supply and the motor manufacture, and urged the importance of his subject from a national and imperial standpoint. An interesting discussion followed.

LEGAL AND LEGISLATIVE DEFENCE FUND.

The following letter has been addressed by Colonel Holden, Chairman of the Motor Union, to members of the Motor Union and automobilists generally. It is hoped that there will be a liberal response thereto.

Sir,—As you are not only the user of a motor-car but also, I believe, deeply interested in the automobile movement, I have been requested to seek your assistance in connection with the administration of the laws and regulations affecting these vehicles. It is of the greatest importance to the movement that these shall be authoritatively interpreted and justly enforced. The Motor Union has spent considerable sums of money in striving to secure this result, but unfortunately the funds at its disposal have proved inadequate to the demands upon them. The Union is in consequence unable to take up all those cases in which its assistance would be of considerable service. The legal and administrative expenditure of the Union may be said to group itself under the following headings:—

(1) Settling important points of general principle by taking test cases to the High Court.
(2) Opposing (a) applications to close roads which are suitable for motor-car traffic; (b), unreasonable applications for a 10-mile limit of speed; and (c) other proposals of public authorities unfairly restrictive of automobilism.
(3) Assisting, under special circumstances, members summoned under the provisions of the Motor Car Act.
(4). Assisting members in appeals to Quarter Sessions.

For all these purposes the Union finds that it is necessary to have a larger sum at its disposal than is secured by the ordinary subscriptions and capitation fees. Acting, therefore, upon suggestions made earlier in the year by Lord Onslow and others, it has been decided to establish a special fund, to be called "The Legal and Legislative Defence Fund," for the purpose of meeting this necessary expenditure. In asking for the liberal support both of individuals and organisations towards this fund, it is unnecessary to urge the importance of this department of the Union's work A great deal of good work has already been accomplished by the Union out of its ordinary sources of revenue. Over £1,100 has been expended during 1904 to protect the rights and extend the privileges of automobilists.

Among the results obtained may be mentioned:—

(1) A favourable decision of the High Court upon a point of law of great importance, the result of which is that motorists are no longer charged with the four offences mentioned in Section 1 of the Motor Car Act in one summons, so that the possibilities of an unfair conviction are correspondingly reduced.
(2) A number of appeals to Quarter Sessions have been successfully assisted, and the system of timing employed by the police in several districts discredited.
(3.) Effective opposition has been given to the applications in various parts of the country of local authorities for regulations for a ten mile limit of speed over large areas.

With reference to the appeals to Quarter Sessions the cost of even a successful appeal varies from £60 to over £200. Such heavy charges practically prohibit men of moderate means from taking their cases, even when unjustly convicted, to appeal, unless assisted. It is therefore only through the Union by the aid of such a fund as this that automobilists can fight unjust convictions.

Judicious expenditure of money is also necessary to pave the way for securing those amendments in the Act of 1903 which experience has already proved to be desirable. In asking, therefore, for liberal contributions to this fund, the Motor Union feel that they are inviting automobilists to aid in the most useful manner the automobile movement.—

I am, sir, your obedient servant,

(Signed), H. C. L. Holden, Chairman.

MOTOR REGULATIONS IN THE ROYAL PARKS.

Mr. H. E. Gwinner, Kensington, appeared before Mr. Marsham at Bow Street Police Court on Thursday of last week to a summons charging him with driving a motor-car in the Green Park at a greater speed than ten miles an hour, contrary to regulations.

Mr. Staplee Firth, who appeared for the defendant, raised the same point as he had done at Marlborough Street Police Court in a case reported in last week's *Journal*. Mr. Aubrey Court, an official from the House of Lords, was called and shown the printed regulations as to the speed of motor-cars posted at the gates of the royal parks. He said they had never been laid on the table of the House of Lords. The latest regulations respecting the London royal parks laid on the table of the House of Lords were dated April 28th, 1904, and they contained no reference to the speed of motor-cars. Mr. Marsham adjourned the summons until Mr. Kennedy, the Marlborough Street magistrate, had given his decision in the case referred to by Mr. Staplee Firth.

Mr. Marsham proceeded to hear a case in which Reginald Welsh, chauffeur to Lieutenant-Colonel Maxse, was summoned for exceeding the speed limit in Green Park. Two police officers stated that on the occasion in question the defendant's car was going at the rate of about seventeen miles an hour. The defendant went into the witness-box, and estimated the speed at which he was going at from eight to nine miles an hour. The Hon. Mrs. Maxse said she was seated in the car at the time with another lady. The vehicle was going at the same rate as an ordinary carriage when it was stopped by a police constable, Other police officers ran up with stop-watches in their hands. It was snowing at the time, and she said, "Why do you set traps on a day like this?" One of the officers replied, "We have to follow our instructions. To-day we shall get fewer than usual because of the weather."

Lieut.-Colonel Maxse said he would raise the same point of law that Mr. Staplee Firth had done. He believed that policemen were honest, and that when they said a motorist was driving at so many miles an hour they thought they were telling the truth. They often, however, made serious mistakes owing to their absolute ignorance of the methods of using a stop watch. The police, too, looked upon catching motorists as a kind of sport, and seemed sorry when it was a wet day because they would

Digitized by Google

have very few captures. If they would look after some of the "scorchers" they would be far better employed than in stopping two ladies who were having a quiet drive in the park. The case has been adjourned to next week on the point of law referred to.

A MOTORIST ACQUITTED.

At the Berks Assizes at Reading, on Saturday, Stanley Munro Noble, a professional motor-car driver, was charged with the manslaughter of a boy, who, while playing in the road, was run over by a motor-car at Hurley, in November last. The driver stopped his car and said he would be back in a minute, but he did not return. It was alleged it was the prisoner who drove the car, but Noble denied this, and said he knew nothing of the accident till told of it by the police. The evidence was very conflicting. In summing up, the Lord Chief Justice said there was no doubt that motor-cars were used for a useful purpose; but, unfortunately, a certain number of motorists—a small fraction he hoped and believed—pursued their pleasure in a most selfish way. Those people brought a great deal of discredit upon a large body of motorists who, on the other hand, pursued their pleasure in a proper manner and with due regard to the safety of the public. The prisoner was acquitted.

SOCIETY OF AUTOMOBILE MECHANIC-DRIVERS.

The second general meeting of this Society took place at the head-quarters, 51, Brick Street, Piccadilly, W., on Thursday of last week. Between sixty and seventy were present, amongst them being Messrs. Sidney Girling, Wood, Budd, Groves and Ebel, and the secretary, Mr. Arthur R. Ivens, was kept busily engaged before and after the meeting, the applications for membership being very numerous. Mr. Woods, President, was in the chair, and read some of the rules and articles of association of the Society, which, amongst other things, provide an employment bureau for members possessing three years' technical and practical experience before being eligible for membership, exclusion of aliens from membership, and protection of owners, members, manufacturers and the public. Mr. Groves, vice-Chairman, said that the idea of the Society was first started between two or three friends at a private meeting: it was mentioned afterwards to prominent members of the Automobile Club and also of the Motor Union, who greatly approved of the movement. The Society was not in any respect a Trades Union—wages would be simply a question between master and man. The main object of the Society was that every man should study his employer, and in the interests of all the employers bring forward the good men and eliminate the bad. A man who could do all fair and square repair work would save his employer many pounds in expenses, and that being so the employer would show every consideration to his servant.

The examination of proposed members will be held every Monday evening by the Committee. They will be handed a number of questions, to be answered in writing. In addition to this they will be asked to answer some verbal questions as to repairs, etc., put by members of the Committee. One rule is to the effect that any member of the Society proved dishonest to the "satisfaction of the Committee, be expelled the Society."

Mr. Sidney Girling, in a brief and lucid speech, said he thought the Society the very thing needed, that it would weed out the bad man and improve the position of the good one—he approved of the rules and constitution, and intended himself to become a member.

IMPORTS OF AUTOMOBILES.

Below we publish our monthly official list of the imports of motor-cars, motor-cycles, and the parts thereof, into the United Kingdom during the month of December, 1904:—

BELGIUM.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, FEBRUARY 18, 1905. [No. 311.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

A BRILLIANT company welcomed Field Marshal Earl Roberts to the second annual dinner of the Motor Volunteer Corps at the Trocadero, London, on Tuesday, and all went merry as the proverbial marriage bell. The discomforts of the field were forgotten—the midnight rides, the early morning struggles with unpatriotic motors that heeded not the advance of the enemy during manœuvres—all such incidental torments of the flesh and spirit were left behind as the gallant motor warriors assembled in their bright mess uniform to acclaim the father of the corps. Lieut.-Colonel Mark Mayhew, to whose initiative the formation of this arm of national defence was due, was in the chair, and modestly recalled the help rendered to generals and other officers by the Motor Volunteers. Motorists had lent their cars and given their service, and—Colonel Mayhew playfully reminded the guests—had killed no generals.

◆ ◆ ◆

Earl Roberts on Motors.

EARL ROBERTS was in reminiscent mood. He remembered how in India, thirty years ago, Colonel Crompton had taken out a traction engine, with the idea of helping the commissariat department. The "ironclad" clambered up a steep hill and rushed madly down the other side, flinging itself into a deep ditch, where it remained for four or five years. But in South Africa really valuable aid had been given by the traction engines of Colonel Crompton, and he had seen guns hauled up otherwise impossible ascents into positions on forts at Pretoria when the need was most urgent. He was glad to see motor vehicles advancing in favour generally. When he went to South Africa last year the highest number he had seen in London was A3000; now it was A8000—a very satisfactory advance. Having regard to what Colonel Mayhew had previously said as to the encouragement he (Lord Roberts) had given the motor volunteers, he felt he was, in a sense, the father of the corps, to all the members of which he wished success and prosperity. Lieut.-General Sir John French also testified to the value of the motor-car in modern warfare, and congratulated the corps on its energy and devotion in perfecting its methods and motors.

◆ ◆ ◆

The Restriction of Speed.

THE Guildford Town Council have received an answer from the Local Government Board to their application for an order to restrict the speed of motor-cars in the borough to a maximum of ten miles an hour. The Board point out the fact that they had had applications under section 9 of the Act from the City of London, Winchester, Dover, Kingston-on-Thames, Beverley, Leeds, Leigh, and Todmorden, in all of which local inquiries had been held, but the Board had not up to the present been satisfied that such a regulation was really necessary in any instance. The fact that comparatively few of the local authorities who were entitled to make applications under section 9 had up to the present done so seemed to indicate that there was generally a disposition to avoid the imposition of speed limits, and in all the circumstances it seemed to the Board desirable that the Town Council should reconsider the advisability of pursuing the application, at any rate in its present form. They would recommend that the Council should specially consider whether, if any speed limit were necessary at all, it should not be confined to streets or parts of streets where the conditions of motor traffic were of an exceptional character.

◆ ◆ ◆

The Postal Motor.

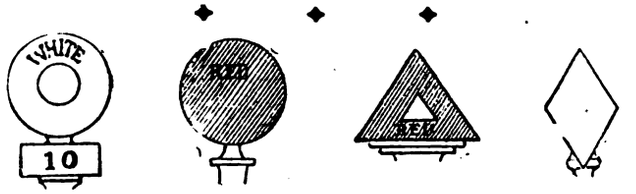
LORD STANLEY is an enthusiastic motorist and a business-like Postmaster-General. Both qualities have received demonstration by the way in which he has encouraged the substitution of motor power for horse haulage wherever such could be introduced with advantage to the public convenience and the public purse. The placing of the contract for the carrying of the mails from London to Brighton is but the forerunner of many such services elsewhere, and the public may regard the passing of the horse from postal work as great a certainty as the coming of the motor-'bus in the streets of the Metropolis. But care will have to be taken that in both cases the initial services are well organised; otherwise, delay may lead to disappointment, and this may give rise to longer delays. "More haste, less speed," is a proverb peculiarly appropriate to the present situation.

◆ ◆ ◆

The Police and Motorists.

THE unusual course taken by the Commissioner of the Metropolitan Police of inditing a defence of the police for recital at a public luncheon might cause a prejudiced person to assume that there was something wrong in his methods to cause such a defence to be made. Mr. Henry, however, has no such feeling; and, although some motorists laughed when they heard his naive sayings, we will accept his assurance with the hope that his subordinates will live up to the character and reputation he has given them. According to the Commissioner, the police select their test distances on the actual level, and when applying for permission to summon have to report upon the state of the road at the time, and also whether the car is fitted with non-skidding appliances. The chronographs used by the Metropolitan Police are supplied by a competent watchmaker, and are systematically tested. Makers of non-skids will probably find in these instructions of the Police Commissioner another reason why such devices should be affixed to tyres.

◆ ◆ ◆



Argyll Developments.

AN important development of the motor-car industry in Scotland was foreshadowed at a dinner at the Trocadero Restaurant, W., which the Hozier Engineering Company, Limited, gave to the numerous agents of Argyll cars on Tuesday evening. Mr. W. A. Smith, the chairman of the company, presided, and he was supported by Mr. A. W. Steven and

Digitized by Google

Mr. Alec Govan, the managing director. The latter, in proposing the health of the agents, made some amusing references to the trials and tribulations associated with the first Argyll car, and afterwards referred to the project at present under consideration by the Hozier Company of establishing a new factory which should be by far the largest of the kind in Great Britain. He pointed out that it was the agents who came into direct contact with buyers and who had the work of breaking down the prejudice of the public against automobiles, and in this connection he encouraged them to further efforts by mentioning that each order secured for a motor-car meant employment for from four to six men for a year. Messrs. A. Pereno, W. L. Sleigh, and W. R. McTaggart responded for the English, Scottish, and Irish agents respectively. Mr. Steven, one of the directors of the Hozier Company, in proposing the toast of "The Press," gave some interesting figures with regard to the economy of motor vehicles for commercial uses; while, in responding to the toast of "Our Hosts," Mr. W. A. Smith gave some further details of the great scheme of extension which the Hozier Company have in contemplation, and stated that in connection with the project the directors had visited all the leading motor-car factories not only on the Continent, but also in America, it being the intention to make the new works second to none. Altogether a very enjoyable evening was spent, and, judging from the enthusiasm displayed, there can be no question that the popularity of the Argyll cars in the past will be more than maintained during the coming season.

◆ ◆ ◆

For ten mile or lower limit of speed, a white ring, 18 in. in diameter, with plate below, giving the limit in figures.

For prohibition, a solid red disc, 18 in. in diameter.

For caution (dangerous corners, cross roads or precipitous places, a hollow red equilateral triangle, with 18 in. sides.

All other notices under the Act to be on diamond-shaped boards.

◆ ◆ ◆

Signs.

Gradually the use of signposts and warning-boards is becoming general throughout the country, and notices on boards of various shapes are appearing to grow out of hedgerows and from the edges of the highway. A circular ring eighteen inches in diameter, with the speed limit in figures below, indicates where restricted speed has been sanctioned by the Local Government Board. A solid disc painted red indicates total prohibition—happily only applied in a couple of isolated cases. Dangerous corners and descents, and other places where unusual caution should be shown, are indicated by notices in the form of equilateral triangles with eighteen-inch sides painted red. All other notices under the Motor Car Act are on diamond-shaped boards.

◆ ◆ ◆

Cordingley's Exhibition.

A month to-day the International Motor-Car Exhibition at the Agricultural Hall, London, will open its doors to the public, whose interest in automobilism is keener than ever. The rumours as to the new cars that, not ready in time for Olympia, will be on view at the Agricultural Hall will be fulfilled in a manner that will ensure success, while the inquiries from the Continent and from America convince us of the thoroughly representative character of the display. Previously we have referred to the great show of heavy motor-vehicles including 'buses; the display of lighter vehicles for pleasure and touring purposes will be equally satisfactory. Then the accessibility of the Agricultural Hall from all parts of the Metropolis is a factor that must not be ignored, and there is no doubt that many people are delaying making up their minds with regard to purchasing automobiles until they have seen what the next Exhibition has to offer.

◆ ◆ ◆

The Agricultural Hall.

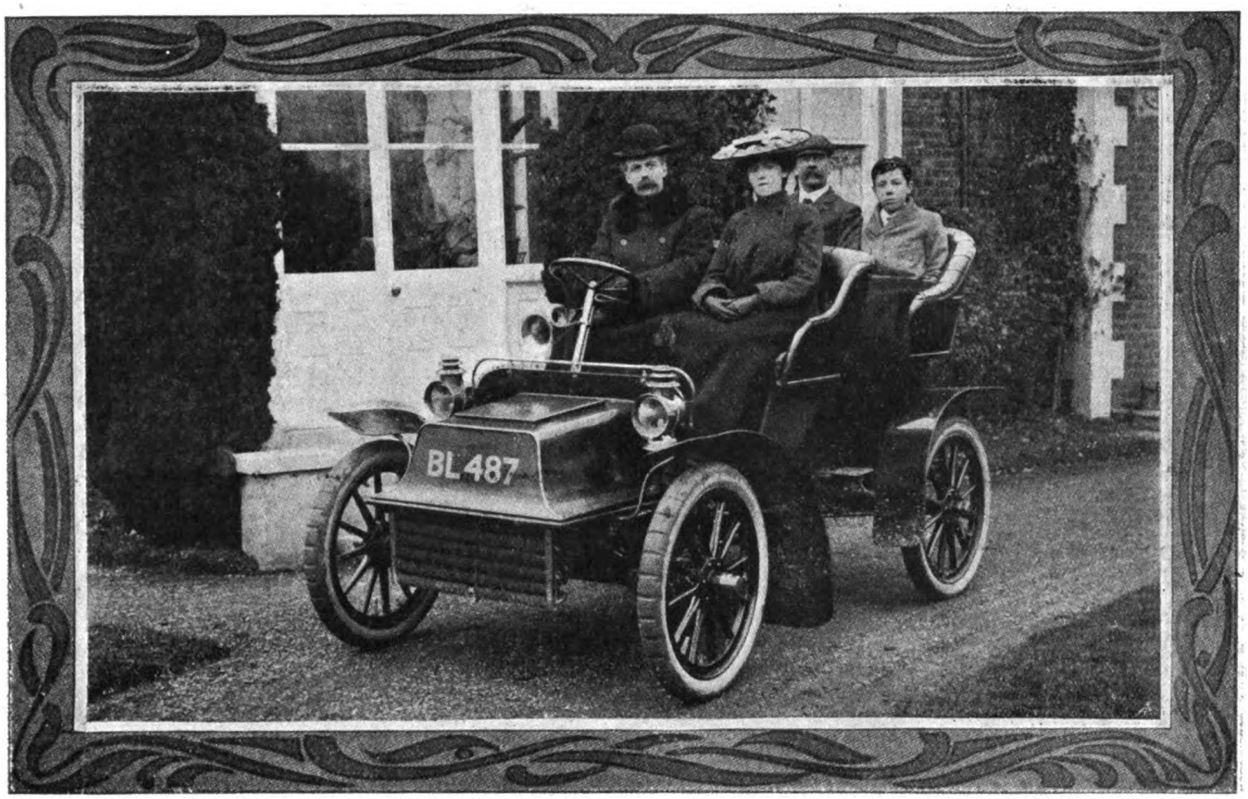
In view of the fact that only a month remains, such prospective motorists are wise, for thus they will have opportunities of seeing all that is to be seen before making the plunge into automobilism. Many new firms will be represented at the Agricultural Hall Exhibition, which will be the largest and best display of automobiles ever held there, eclipsing even the splendid shows of 1904 and 1903. Of the three hundred firms that will exhibit at the Agricultural Hall more than half have not exhibited at any other display this year, so that its really representative character can be readily imagined. In addition to the motor-car section the Aero Club is organising an exhibition of airships and balloons which will be of popular interest. Compared with the letting spaces at other buildings in this country, the Agricultural Hall, with its Great Hall and wide galleries, the Minor Hall, North Annexe and other exhibiting areas, remains the premier place for an automobile show—as will be demonstrated when the Tenth Annual Exhibition opens on the 18th prox.

◆ ◆ ◆

Royal Patronage.

We congratulate the promoters of the exhibition at Olympia on the success which has attended their efforts, and on the fact that so many notable people have again shown their interest in motor-car exhibitions. This has always been a feature of the shows held at the Agricultural Hall, and to give a list of those who, the last few years, have attended the displays there would be to issue a second "Who's Who." The visit of the Prince of Wales to the Agricultural Hall Exhibition two years ago was really the first Royal favour bestowed on the trade, and the interest he then displayed did much for the industry. The Premier, too, has been a follower of the exhibitions there, and, with Miss Balfour and his two brothers, Colonel Eustace Balfour and Mr. Gerald Balfour, M.P., was a visitor in the old days, when the arena provided London with a new sensation. Cars intended for the use of the Royal Family are ever an attraction to the public, and the presence of vehicles for the Queen and others of the reigning house has always been associated with the Agricultural Hall Exhibition. Hence the fact that similar assistance has been rendered to popularise the Olympia Show speaks well for the impressions left on the minds of our princes and rulers by Cordingley's Exhibitions.

◆ ◆ ◆



Motor-Car Registration.

In a report which they have just issued upon the procedure with regard to the change of ownership of motor-cars and cycles, the Highways Committee of the London County Council state that their attention has been drawn to cases in which cars and cycles registered by the Council have been disposed of without notice being given to the Council as required by the regulations of the Local Government Board, and have afterwards again changed hands, the facts only being brought to the Council's notice by the third owner. The fee for the registration of a motor-car is £1, and when the ownership of the car is changed a further fee of 5s. is payable. It appeared to the committee that in the cases which were brought to their attention the registration of the cars became void, and that they could not properly be used by the third owner without being registered afresh. They thought it right, however, to communicate with the Local Government Board on the matter.

Digitized by Google

The L.C.C. View.

THE Board stated in reply that it was disposed to consider that, in the majority of cases, on the receipt of an application from a person alleging himself to be the new owner of a motor-car already registered, it was not incumbent on the Council to make so detailed an investigation of the facts as would be needed to enable it to determine what actual changes of ownership had taken place. The Board took the view that the third owner, who might wish to comply in all respects with the Motor Car Acts and regulations, should not be penalised in consequence of the delinquencies of previous owners of the car by having to register the car anew and pay the fee of £1 instead of availing himself of the ordinary procedure in regard to the change of ownership, the fee for which is 5s. The committee of the L.C.C. have given the matter careful consideration, and they have decided to ask the Council to agree that in those cases in which changes of ownership of motor-cars registered in London have not been brought to the notice of the Council every endeavour shall be made to secure the proper registration of such changes of ownership, and that in those cases in which it is not possible to effect all such registrations the registration of the car be declared void, and that the last owner of whom the Council has notice shall be required to register the car afresh.

Mr. F. C. Hopson, the Mayor of Newbury, at the Wheel of his Cadillac Car.

◆ ◆ ◆

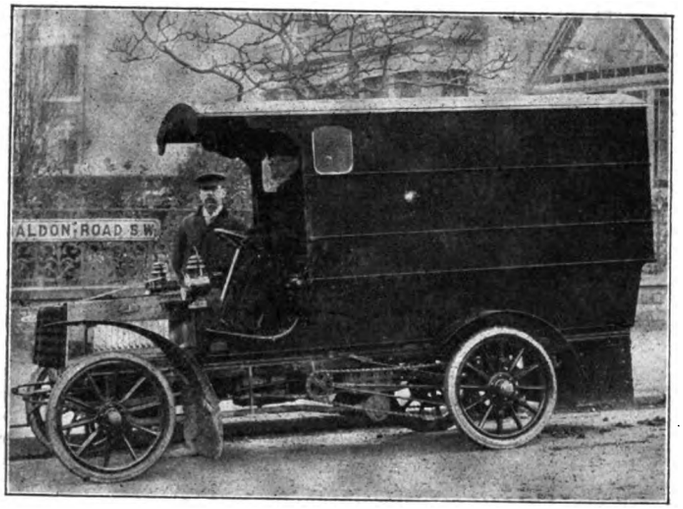
The Motor-'Bus Trial.

THE 24-h.p. Straker-Squire public service *chassis*, fitted with trial body, carrying a load equivalent to twenty-five passengers, and weighing altogether 5 tons 0 cwt. 36 lbs., fitted with "Sirdar" tyres, 2 ft. 8 in. diameter by 4½ in. wide, single, on the front wheels, and 3 ft. 6 in. diameter by 4 in. wide, double, on the back wheels, has completed its trial of 2,000 miles under ordinary working conditions, and under the continuous observation of officials appointed by the Automobile Club. The daily runs consisted of approximately 100 miles on main roads, starting from and returning to the Automobile Club Motor-house, where the car was locked up each night after washing, lubricating, replenishing, and making any necessary adjustments in the motor-house, all under observation. Supplementing the official report of the Automobile Club on the successful 2,000-miles reliability trial of the Straker-Squire 24-h.p. petrol omnibus, the following figures supplied by Messrs. Straker and Squire are interesting. The work done during the trial equals 52,000 passenger miles, or, taking the gross weight of 5 tons, 10,000 gross ton miles. This has been accomplished in the total running time of 168¾ hours, an average of about twelve miles per hour, with a petrol consumption of 2,297 gallons, equal to 0·297 gallons per gross ton mile, or, approximately, seven miles to the gallon. The fuel consumption was increased by the very heavy condition of the roads during most of the trial, which was accomplished without any mechanical troubles. The involuntary stops recorded were for trivial matters almost inseparable from running a car with a heavy load over rough winter roads. Regarded from the profit-earning point of view, based on one penny per passenger mile, the revenue from a paying load during the period of the trial would have been £216, or over £70 a week. Against this a liberal estimate for working expenses would be £18 per week. The vehicle was equipped with Sirdar tyres, which behaved exceedingly well, and were not affected by the ten miles of unrolled macadam which were encountered during the journey.

◆ ◆ ◆

The South Wales Club.

GOOD work was done during the past year by the South Wales and Monmouthshire Automobile Club, some excerpts from the annual report of which appear on another page. The headquarters of the club include a motor house with accommodation for forty cars—a provision that no other provincial club can offer its members. We are glad to observe that the club has decided to give the free use of the head-



Digitized by Google

quarters to the members of other provincial clubs who can reciprocate, and to motor volunteers when on military duty. Unfortunately, few clubs will be able to reciprocate such good services, but they can, at least, be prompt to follow so excellent an example in the way of catering for their members.

◆ ◆ ◆

Municipal Motor Service.

RECENTLY there was supplied to the Wandsworth Borough Council by Messrs. Coles and Co. a 9-h.p. two-cylinder "Star" van, which is now engaged in the municipal service. It is interesting in the fact that it is the first motor-van used for the purpose of collecting infected bedding, etc., and taking it to the disinfecting station which has lately been built for this purpose. The body of the van is six feet clear behind the driver's seat, and is lined with zinc throughout, being partitioned off behind the driver, and practically air tight. Once the goods are inside, the van is not again opened until it is within the special building for the reception of the goods at the station. This system has been in working order for two months, and has given satisfaction to the Wandsworth

Borough Council. The neighbouring councils are closely watching this development of motor work, with a view to possible adoption of the idea within their areas.

◆ ◆ ◆

Central Standards on Highways.

WITH reference to the letter addressed by the Roads Improvement Association in November last to the Board of Trade asking the Board to withdraw the sanction that they had given some months before to the erection of central standards on the Great North Road at Finchley, in connection with the construction of a light railway, the Board of Trade have informed the Association that the Finchley Urban District Council, who are the local and road authority for the district, strongly desired centre post construction instead of the side posts and span wires proposed by the Middlesex County Council, and after an inspection and report by one of their officers the Board felt unable to overrule the views of the Urban District Council. The Finchley Urban District Council adhere to their position and in the circumstances the Board of Trade cannot vary the decision previously given. The reply of the Board serves to illustrate how local considerations and local views have been permitted to prevail over national interests and national experience. It is evident that the Board of Trade have done their best to induce the local authority to withdraw their request for central poles in deference to the experience gained in other districts, which is overwhelmingly against their use. The Roads Improvement Association are introducing a Bill into Parliament during the forthcoming Session to carry out the recommendations of the Departmental Committee on Highways, one of which provides for the classification of national roads and the establishment of a central department to supervise their maintenance. The erection of centre poles on the Great North Road at the request of a small district council, against the wishes of the Middlesex County Council, the Board of Trade, and the through traffic as represented by the Roads Improvement Association, is another instance of the folly of entrusting the maintenance of trunk roads to urban and rural district councils, and affords a further argument for the early establishment of a central body to protect the nation's interest in its main roads.

◆ ◆ ◆

A Motor Meet at Blackpool.

THE Advertising Committee of the Blackpool Town Council have been considering the idea of holding a motor meet in the town during the summer, with a view to benefiting the resort. A scheme was drawn up, and this was presented at the last council meeting by the chairman of the committee, Mr. Alderman Bickerstaffe. The council were in favour of the scheme. July 13, 14, and 15 are suggested as the most suitable dates for the meet, but if this cannot be arranged the event will take place in the week ending July 29, so as to avoid clashing with the motor meet at Brighton. It is possible that there will be races for motor-boats as well as motor-cars.

◆ ◆ ◆

The Late Mr. Guy.

WE regret to learn of the death of Mr. Edward Guy, our correspondent in Algeria, whose name has frequently appeared in other journals concerned with automobile matters. He was an enthusiastic motorist, and when in England a year last summer bought a 24-h.p. Darracq at Friswell's, on which he made many excursions into the desert. A loving husband, a good son, and a faithful friend, the news of Mr. Guy's untimely death in the Atlas Mountains one day this week will be received with regret by the many friends he made wherever he was known.

◆ ◆ ◆

The 5,000 Miles Trial.

REFERENCE has already been made to the successful conclusion of the 5,000 miles trial of the 12-h.p. two-cylinder Siddeley car. The journey was made in thirty-three stages of about 150 miles each. Four persons were carried each day, as well as spare parts, and during the greater part of the time the roads and the weather were equally unsuitable for the enjoyment of motoring. The cost of running was less than £20, and the trip was void of mechanical troubles. The "Continental" tyres gave great satisfaction, and have disproved the contention of many lukewarm supporters of the automobile movement as to the excessive expense of pneumatic tyres. Mr. J. D. Siddeley is to be congratulated on the success of the trial.

THE motor-'buses shortly to be put upon the road by the London Road Car Company will be tyred by the Peter Union Tyre Company.

JUST as we had gone to press last week we learned of an important change which is to take place in the Siddeley Autocar Company. The Wolseley Tool and Motor-Car Company have purchased the business of that company, and will in future control the sale of the well-known Siddeley cars in addition to the Wolseley, Mr. J. D. Siddeley joining the Wolseley Company to take entire charge of the sales department of that concern, which has also acquired the extensive premises in York Street, Westminster, known as Niagara, until recently occupied by the City and Suburban Company. The premises are to be converted into a huge depot and garage, and will practically form the headquarters in London of the Wolseley Company.

THE MOTORINA'S PAGE.

By "Petrola."

"RIDING outside to oblige a lady" on a 'bus is an almost forgotten courtesy. But I note that a correspondent in a recent issue of the *Motor-Car Journal* has instituted a new chivalry for the car. He complains that when a breakdown of his car occurred by the wayside and he appealed to a passing motorist to give the two ladies of his party a lift to the nearest railway station, the seats being filled up, the only accommodation offered to his ladies was that "they could sit on the footboard if they liked." This, he says, is the first time during his five years' motor experiences when gentlemen have not volunteered to give up their seats to ladies.

A great friend of mine prefers to personally conduct her own car, and is really a most skilful and capable driver. But it is sometimes hard to convince the mere man that any woman is clever at mechanics. Anyway, after my friend had driven her car several thousand miles without any break-down or necessity for serious alterations and repairs, it was taken to the "shop," something having gone wrong with the differential. "Ah," said one of the chief mechanics before looking at the car, "Druv' by a lady, was it"? His sly head-shake and a cunning look, as much as to say "I could tell volumes about lady druv' cars if I wanted to," was so delightfully comic that even the chauffeur had to laugh. And have you ever noticed how very grave and serious chauffeurs are as a class? They look as though the weight of a 1,000 horse, 60-cylinder racing car were pressing down their spirits.

Talking "Car."

There is not the slightest reason in the world why a woman should not drive, repair, sleep in and dream about her car. But there is one thing she never should do, and that is to "talk car." Women used to be accused of "talking servants" in season and out of season. But that is a mere trifle to discussing the inside mechanism of your car with the shocking familiarity some feminine enthusiasts display. And nothing bores a man so much as to be talked "motor mechanism" to by a woman. He feels instinctively that engineering and mechanical details do not sit prettily on feminine lips, especially on pretty lips. I suppose it is a case of "love me, love my motor," and a woman thinks if a man is interested in her, he will naturally revel in the gears, fat sparks and other jargon of the garage. But, just as every really nice man thinks ever so much more of a woman who is afraid of a mouse, so every man motorist likes to think he knows just a little bit more about motor mechanics than the wife of his bosom or the lady of his love. In fact, I heard a much married man, whose wife is motor mechanic mad, remark the other day that, "when a woman contradicts her husband before the chauffeur, and declares that she knows the reason of the breakdown while he does not, it is about time to make incompatibility of motor knowledge a ground for divorce."

My own experience is that a woman may for ever destroy a man's peace of mind, spend every farthing he has in the world, shatter his hopes and happiness, and he will forgive her; but to give him advice when a motor breakdown happens is the sure and only way to rouse his eternal unforgiveness.

A dance in a garage is rather a novel idea. Nevertheless, a most gorgeous ball was given a week or two ago in what is perhaps the most luxurious garage in the world, near Pittsburg, U.S.A. Above the actual motor stable is a magnificent room with a polished floor, decorated with palms, lounge chairs, and every luxury, including a spacious verandah, and several smaller rooms adjoining, the whole forming an ideal setting for balls and social entertainments. The chief accessory to the building which women motorists will envy is a "cedar room" for the storage of furs. Cedar wood is well known to be fatal to moths, and a room entirely lined as to floors, walls, and roof with cedar is an absolute death trap to the moth which steals in, corrupts and ruins the furry rugs, coats, caps, and kit belonging to the car.

Vanity Fair.

A remnant of pretty brocaded silk makes a charming "Vanity Bag" for feminine use on a motor-car, but the lining should be fitted with a number of small compartments run with narrow elastic to make each into a snug little pocket. A little tin of cold cream, a box of hairpins, a spare fringe net, a tiny vinaigrette, a "one night" cake of soap, small comb, powder puff or papier poudre book, two or three manicure implements, a folding motor mirror, a piece of chamois leather and a little roll of American cloth, with white silk lining, carrying a spare veil and some veil pins, and here is a "Vanity Bag" which will help the motorienne to make her toilet at a wayside hotel before luncheon or dinner and ensure a neat, smart appearance on tour whenever she "steps off." The space taken up by this miniature dressing-case is very small, nevertheless it contains all a lady needs in the way of toilet appliances. It is a wise precaution to have a mackintosh bag slightly larger into which to slip it for protection against dust, mud and rain.

No woman should start on a motor trip minus a spare veil. All sorts of things may happen to make the lack of it a small tragedy of the toilet. I once saw a well-known lady motorist come into a smart hotel for luncheon without having taken the precaution to first visit the dressing-room mirror. The lady in question is very pretty, but, unfortunately, she does not believe in the beauty which is unadorned. Therefore she rouges. *En route* a little dampness had caused the rouge to transfer itself from her cheeks to her white lace veil. The effect was startling, and the crimson outlines on the white veil had a most weird effect. Presently her husband noticed the phenomenon, whispered something, and she withdrew in confusion to reappear presently minus her veil and the artificial colouring, which she really does not need, seeing that she is a comely, attractive woman.

Proud motoring parents are always trying to prove that their baby is the record infant motor prodigy of the world. The modern baby goes to his christening on a racer, and several fond fathers are trying to arrange that baby shall have the distinction of cutting his first tooth on a motor-car. I know one precocious infant who had accomplished a 1,000 mile tour by the time he was four months old. He had a specially built basket in the tonneau, a spirit lamp for warming his milk, and plenty of "spares" in the form of patent baby foods and comforts. In fact, his earliest recollection is of meals flavoured with petrol, and the first time he ever "took notice" was when his parents fell into a police trap. He howled sympathetically, and refused to be comforted till the "force" fled from the wayside concert.

(To be continued.)

We learn that Messrs. Shippey Brothers have made arrangements to place on the market a new 24-h.p. four-cylinder touring car. The vehicle, which will be known as the "Empire," will be fitted with bevel gear and live axle transmission and ball bearings. One of the features of the new car is that it will be fitted with Swinehart 34 in. by 4 in. "Concave" solid rubber tyres to artillery wheels specially constructed by Messrs. Smith, Parfrey and Co., Ltd. Although the *chassis* will be of American manufacture, the bodies, of special design with double side-entrance, will be constructed by a well-known West End carriage builder. Messrs. Shippey Brothers inform us that one of the new cars will be finished in time for exhibition at the Agricultural Hall Show next month.

THE "LITTLE MIDLAND" TWO-SEATED CAR.

WE illustrate herewith a new two-seated petrol car known as the "Little Midland," which has recently been put on the market by Mr. Wm. M. Cunningham, of the Midland Works, Clitheroe. The frame is of wood and steel construction, with tubular cross stays to support the engine and gear. The engine, a single-cylinder one of 7½-h.p., is located in the fore part of the frame, but at right angles to the usual

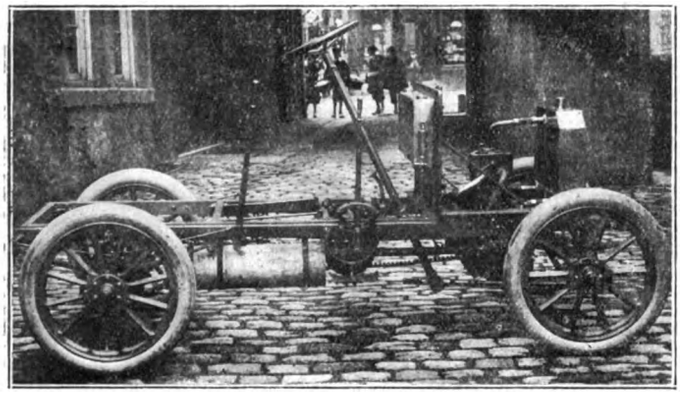

Fig. 1.—View of Chassis.

position, that is to say, the flywheel rotates in the same plane as the road wheels. The power is transmitted through a Renold silent chain to a gear-box giving two forward speeds and a reverse, the pinions being always in mesh; the gear is controlled by a single lever. From the gear-box a single centrally-located chain conveys the power to the rear live axle. The ignition is by coil and accumulator, while the radiator is of the ribbed tube variety, set in a frame which forms the water tank. The wheel base of the vehicle is 6 ft. 1½ in., and the track 3 ft. 0½in.; the road wheels are all 28 in. in diameter, shod with 3 in. tyres.

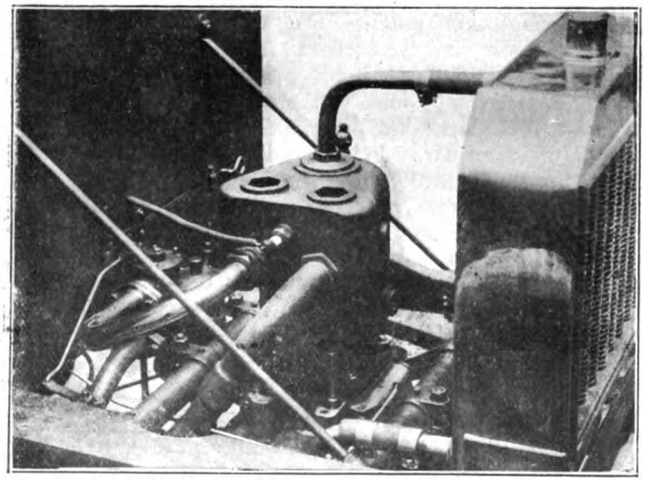

Fig. 2.—View of Engine and Radiator.

The car, which is provided with two bucket seats and ample accommodation for luggage, appears to be strongly constructed, and is stated to be speedy on the level and an excellent hill-climber. A noteworthy feature of the car is that practically all the bolts employed are of English standard sizes.

WE hear that tri-cars may shortly be utilised by the proprietors of the "Westminster Gazette" for the rapid distribution of their papers in the London suburbs.

CONTINENTAL NOTES.

The Gordon Bennett Deadlock.

The position with regard to this year's Gordon Bennett race is more complicated than ever. At a meeting of delegates of the German, Italian, Austrian, Swiss, and American clubs, held in Berlin on the 6th inst., it was resolved to ask the French Club to convene a meeting of the International Gordon Bennett Commission to consider the present deadlock. In response to this the A.C.F. has fixed a meeting to be held in Paris on Monday next, the 20th inst. In the meantime the position has become more difficult, inasmuch as the Chambre Syndicale de l'Automobile and the Chambre Syndicale du Cycle et de l'Automobile, the two French motor trade societies, have passed resolutions in favour of the Gordon Bennett race being held in conjunction with the Grand Prix, but that the latter shall be an open race, that is to say, that any number of cars can be entered by makers in the different countries. A point which renders the whole question more difficult of solution than ever is the step which has been taken by a number of the French manufacturers, who, considering that their interests deserve quite as much consideration as those of foreign makers, have decided not to compete for the Gordon Bennett if the race is not run in conjunction with the Grand Prix. An engagement to that effect has, it is stated, been signed by the following firms:—Clement-Bayard, De Dietrich, Mors. Darracq, and Renault. The Committee of the A.C.F. has decided to take no further action in the matter until after Monday's meeting of the International Commission.

◆ ◆ ◆

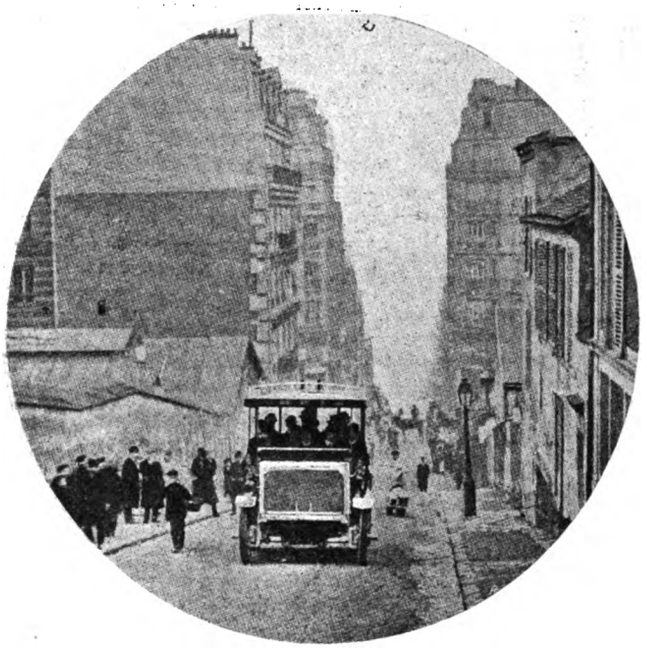
American Views on the Joint Race.

The last American mail brings with it the views of our transatlantic contemporaries on the question of the A.C.F.'s proposal to run the Gordon Bennett in conjunction with the Grand Prix race. The "Horseless Age" considers that it would have been impossible to guard more thoroughly in the rules against the possibility of the prize being secured by a non-French competitor, except by barring such competitors altogether. To propose a race with such rules as an equitable competition between the automobile industries of the different nations is simply a piece of effrontery or stupidity, and a poor testimony to the confidence of the French manufacturers in their ability to hold their own in competition with the world. The New York "Motor World" remarks that it would be interesting to discover the process by which the promoters of that French "consolation raee," styled the Grand Prix, arrived at the "relative importance" of the automobile industry of the United States. It suggests that the Frenchmen are either handing out a left-handed insult or are unconscious jokers or monumental ignoramuses, at least so far as concerns the volume and extent of the American industry. But, then, the whole race is something of a joke, if not a studied attempt to tear down the importance of the Cup contest. When the Frenchmen display such false colours it is time for the rest of the world to protest and to hold aloof and for Mr. Bennett to withdraw his Cup.

◆ ◆ ◆

The Official Sanction.

It is announced that the Government authorities have accorded the necessary authorisation for running the races for the Gordon Bennett Cup and the Grand Prix de l'Automobile Club de France on the proposed Auvergne Circuit. The drivers of the three Clement-Bayard cars in the eliminating contest will be Messrs. Clement, jun., Hanriot, and Villemin. The Renault team is stated to be Messrs. Sisz, Edmond and Bernin. The last-named has recently been driving a Renault racer in America; Edmond has hitherto been seen at the wheel of Darracq cars, while Sisz is a foreman in the Renault works, and acted as mechanician to M. Louis Renault in the Paris-Vienna and Paris-Madrid races. Messrs. Lancia and Cagno, who will drive Fiat



Digitized by Google

cars for Italy in the Cup race, went for a trial spin over the Auvergne course last week.

◆ ◆ ◆

A Serpollet Public Service Steam Car.

An interesting trial was made last week in Paris of a new Serpollet public service steam vehicle, the car successfully mounting the steep gradient of the Rue des Saules, in the Mont-

The Serpollet Public Service Steam Car ascending the Steepest Hill in Paris.

martre district. The car is of 20-h.p., chain driven, and complete with water and fuel, and a load of seventeen passengers, weighed 3 tons 16 cwt.; it is one of a number intended for a service between Nice and Mentone. The thoroughfare referred to above is stated to be the steepest in Paris, the gradient averaging nearly 1 in 5, with one short stretch, it is stated, of 1 in 2½.

◆ ◆ ◆

The Herkomer Trophy Competition and the Bleichroder Cup Race.

The Bavarian Government has given permission for the holding of speed trials on the Kesselbergstrasse and in the Forstenrieder Park in connection with the above-named events. The races in the park are to be held on a Sunday in August next, the meeting extending altogether from the 10th to 16th August. The full rules relating to both events have now been issued by the Bavarian Automobile Club, 21, Schommerstrasse, Munich, where copies can be obtained.

◆ ◆ ◆

A Flying Machine Exhibition.

An exhibition of flying machines, "heavier than air," organised by the Aero Club of France, opened on Sunday last in the Galerie des Machines, Paris. There are twenty-nine exhibitors, several of whom show a number of models. In no case is there a balloon attachment, and some are worked by motors, whilst others imitate the movements of birds. The afternoon was devoted to a series of preliminary trials. The machines were launched from a stage 120 feet high into the immense space of the Galerie des Machines, to fly or flounder as best they were able.

◆ ◆ ◆

An International Acetylene Lamp Competition.

After ten months devoted to testing, the judges have announced their award in the competition of acetylene lamps organised jointly by the German Automobile Club, the Mid-European Motor Union and the German Acetylene Society. Fifty entries were received, and these were divided into three categories:—(1) complete lamps and generators; (2) lamps without generators; and (3) generators only. The following are the results:—Class 1: First prize, not awarded; second prize, divided between the Westfälische Metallindustrie Gesellschaft, Lippstadt, and Herr J. Schwarz, Berlin. Class 2: First prize, Messrs. A. Boas, Rodrigues and Co., Paris, for the B.R. lamp; second prize, the Westfälische Metallindustrie, Gesellschaft; and the third prize, the Oberrheinische Metallwerke, Mannheim. Class C: First prize, Messrs. E. Jul. Arnold Nachf, Dresden; and the second prize, the Oberrheinische Metallwerke.

A Bavarian Motor Volunteer Corps.

Following the example of the German Automobile Club, the Bavarian Club has decided to form a motor volunteer corps. The club has over 240 members; of these about 170 own cars, a large proportion of whom have notified their intention of joining the new corps.

◆ ◆ ◆

Public Services in Germany.

A company has been formed in Munich to be known as the Automobil-wagen Verbindung des Bayerischen Hochlandes, to establish public motor services between Garmisch-Partenkirchen and Mittenwald. The Bavarian Postal authorities are about to make some experiments with a motor-vehicle for the transport of the mails between Tolz and Lenggries.

◆ ◆ ◆

A Spanish Automobile Week.

The example set by Cannes and Nice in organising an automobile week is now to be followed at San Sebastian, where the authorities of the Casino propose to hold a series of motor-car and boat races during the coming season—probably in September next.

◆ ◆ ◆

The Kiel Motor-Boat Races.

The German Automobile Club has published the conditions for the two days' motor-boat racing to be held during the Kiel Regatta Week. The races take place on June 29th and 30th. The boats will be divided into three categories: racing, pleasure

A Typical Road in France.

and traffic, and fishing boats:—Racing Boats.—Class A is open to boats of from 60 to 82 ft. in length, of unlimited horse-power; Class B, boats measuring from 40 to 60 ft., horse-power unlimited; Class C, boats measuring from 26 ft. to 40 ft., horse-power unlimited; Class D, boats measuring 26 ft. and less. Pleasure and Cruising Boats.—Class E, boats with motors of upwards of 10-h.p.; Class F, boats with motors of 10-h.p. and less.

Digitized by Google

THE "BROTHERHOOD" CAR.

[*Continued from page* 1035.]

THE bearings of the engine crank-shaft are provided with ring lubrication; the big ends and cylinder walls are lubricated on the splash system, the oil itself being continuously fed from a positive-action combination mechanical and hand pump lubricator, which, besides assuring a certain supply of oil under all conditions, varies the quantity of the same according to requirements and engine speeds. The lubricator is fitted

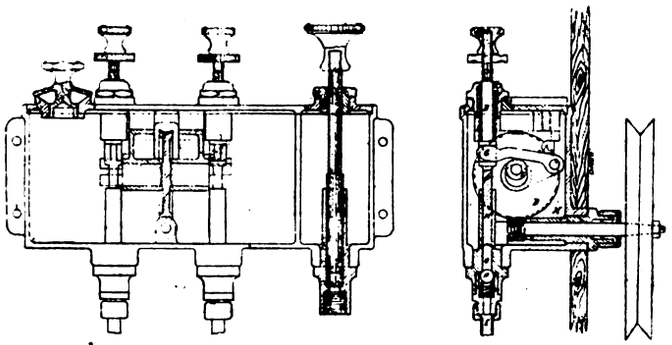


Fig. 16.—Part Sectional Elevation of Automatic Lubricator.

on the dashboard, and is driven from the half-time shaft of the engine by a belt. Referring to the sectional illustration of the lubricator (Fig. 16), it will be seen that the pulley spindle terminates at its inner end in a worm *A*, which drives the worm wheel *B*. On the spindle of the latter are a series of cams *K*, corresponding to the number of oil feeds. As the spindle rotates, the cams lift the levers *C* and the rods *N* against the action of the spring *D*, allowing a small charge of oil to flow into the

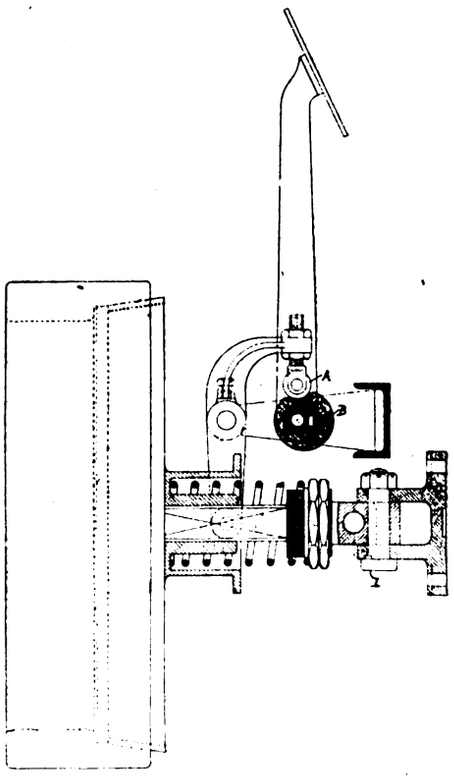

Fig. 17.—Section of Clutch Operating Mechanism.

well *O*. When the lever *C* and rod *N* are raised to their maximum they are released by the cam, and are forced down suddenly by the spring *D*, thus ramming the oil in the well *O* through the ball-valve *F* into the feed-pipe *E*, the pressure being sufficient to overcome any obstruction in the latter. Being driven by the motor itself, the lubricator works automatically, without any attention beyond filling the container with oil when required, and its action is not affected by the oil becoming thicker or thinner, as may be caused by cold or hot temperatures.

Passing now to the transmission, we come to the clutch, a view of which is given in Fig. 17; it is of the conical leather-faced type, flat segmental springs being inserted between the leather and the clutch face, to ensure gradual but positive contact. It is so arranged that it can be readily dismounted without disturbing any other part, a special joint, detached by removing one bolt, *I*, being introduced on the shaft between the clutch and the gear-box. Both the fly-wheel and male portion of the clutch are provided with arms, shaped in such a way as to act as a fan to draw a powerful current of air through the radiator. The motor and clutch are protected from below by a metal shield; the latter, which extends as far as the gear-box, is not of the usual form, but resembles somewhat a long motor bonnet inverted. The push pedal which operates the clutch and the countershaft brakes works in conjunction with a cam and roller device, A, B,

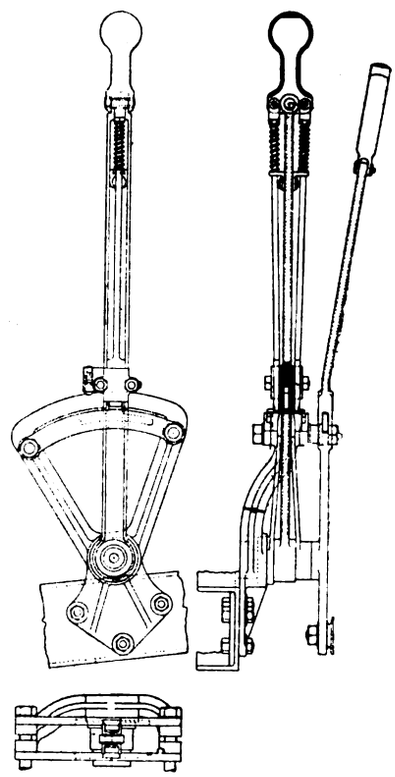

Fig. 18.—Details of Change Speed Lever.

Fig. 17, so arranged that as the roller connected with the clutch-withdrawing mechanism is raised by the cam it reaches a part of the latter the contour of which is such that the strain of holding out the clutch is taken by the cam and not by the foot of the driver; to apply the brake the latter has consequently only the exertion of further pushing forward the pedal, the clutch being held out by the cam. On releasing the pressure on the pedal, the roller readily frees itself and allows the clutch to re-engage.

Four speeds and a reverse are provided, controlled by one lever; the change-speed gear (Fig. 19) is of the sliding pinion or *train-balladeur* type, each pair of sliding pinions being mounted on a separate sleeve. Notwithstanding the favour with which ball bearings are now viewed, the builders of the Brotherhood car, while employing ball thrust bearings, have decided to retain the plain type, fitted with a self-oiling device, for the change-speed gear shafts. It will be seen that oil filters are provided to each bearing, and also that the change gear and bevel

Digitized by Google

pinions are of ample dimensions. The gear-box, which also encloses the bevel drive and differential gear, is mounted at six points, four on the main frame, and two on the cross member at the rear of the differential shaft. Hand holes are provided to both the change speed and differential gears, the holes being covered by plates fastened down by wing nuts, which can readily be detached, while the whole gear-box can be taken out of the car without removing or affecting the driving chains, foot brakes, or any other part. The differential shaft is provided with stepped

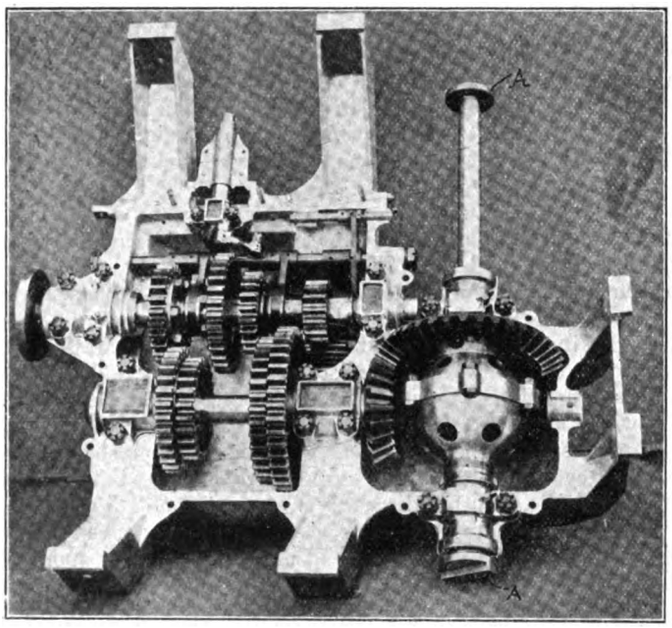

Fig. 19.—View of Change-Speed Gear and Bevel Drive.
A.—Joints on Differential Shaft.

clutch joints *A*, Fig. 19 to allow for any deflection, and also with self-oiling bearings, the oil wells of the latter being provided with locomotive-type inspection caps. From the differential shaft the power is transmitted to the rear road wheels by side chains. The rear chain rings are bolted to a steel ring forming part of the wheel hubs. Although the bolts which connect the chain ring to the steel ring also pass through the wheel spokes, the bolts are a loose fit in the holes in the latter, and therefore no strain is put on the spokes, the power being imparted from the chain wheels to the road wheels through the hubs and not through the spokes. The arrangement adopted not only adds to the strength of the wheel, but ensures perfect alignment of the chain wheels.

All forward speeds and reverse are manipulated by one lever only, Fig. 18, working in a single "gate" with a plain forward or backward motion for each gear, giving a positive thrust in each case, and preventing the possibility of missing or passing through the desired speed. The lever is really a compound one, and consists of three levers, arranged side by side, and controlled by a single ball knob. Two speeds are controlled by pulling over the knob to the left; this causes the outer lever to engage with a catch, which can then be moved either forwards or backwards along the quadrant. The two other speeds are obtained by putting the knob over to the right, so bringing its corresponding lever into engagement. For reverse, the lever as a whole, with the knob vertical, is simply pulled back the full extent of the quadrant. The lever is simple to manipulate and obviates the necessity of springing or sliding the lever sideways along the paths of a complicated gate; at the same time it indicates the position of the gears without the necessity of taking the eyes off the road.

(To be continued.)

We learn that a silver medal for elegance was awarded the "Brown" petrol car at the Turin Motor Exhibition.

HERE AND THERE.

The Motor-Car Company (1905), Limited, has been registered with a capital of £2,000.

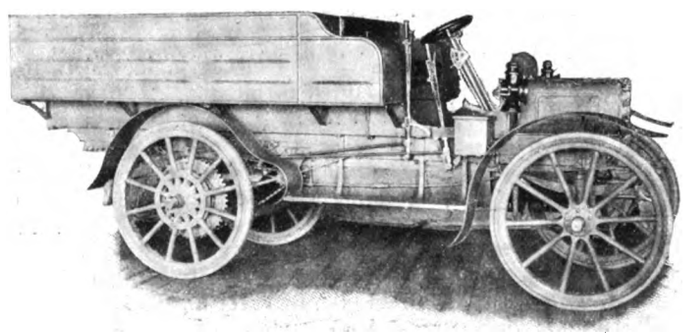
The address of Mr. C. P. Wilson, the hon. secretary of the Yorkshire Automobile Club, is 5, Park Row, Leeds.

A motion to provide a motor-car for the electrical engineer of Aberdeen has been defeated at the Aberdeen Town Council.

A motor mail service is about to be inaugurated between Angers, St. Laud and St. Martin-du-Bois (Maine-et-Loire), France.

The Scottish Motor Garage Company, Limited, Glasgow, have been appointed the agents for the Prosper-Lambert petrol cars in Scotland.

The Great Central Railway Company are introducing motor-trains on their lines between Chester and Wrexham and between Chester and Seacombe.



During the trial of a motor fire engine at Tottenham last week the driver lost control of it in turning a corner, and it dashed into the shop window of a firm of furniture dealers and did considerable damage.

The Eclipse Machine Co., Limited, Oldham, have just delivered to their London agents, the Balcombe Motor Co., 12, Balcombe Street, Marylebone, a Rothwell 10-12-h.p. tonneau car, for inspection and trials in the London district.

Messrs. Jonas' Wheels, Limited, has been registered with a capital of £5,000, to adopt an agreement with Mr. G. Jonas, to carry on the business of manufacturers of and dealers in pneumatic and other tyres, wheels, and rims for automobiles. The first directors are Messrs. G. Jonas, M. J. Jonas, B. Jonas, G. H. Bramson, and S. F. Edge.

The Greyhound Motors, Limited, has been registered with a capital of £1,000 to acquire the business carried on by Messrs. W. H. Watson and A. F. Oliver, at Woodthorpe Road, Ashford, Middlesex, as Watson and Oliver, to adopt an agreement with the said vendors, and to carry on the business of manufacturers, builders, and repairers of, agents for, and dealers in motor-cars, etc.

We illustrate herewith a petrol motor lorry which has just been sent out to South Africa by the Motor Manufacturing Co., Ltd., to the order of one of the leading firms there. It is fitted with a 12-16-h.p. two-cylinder motor and a new three-speed gear of the sliding sleeve type with direct drive on the top speed. The motor is fitted with concentric balanced cranks, mechanically-operated valves, high tension electric ignition, and is exceedingly quiet in operation. The wheels are 46 in. dia., shod with large solid rubber tyres, the large wheels being fitted

in order to raise the lowest part of the mechanism 18 in. from the ground. The body is a very roomy one, and 30 cwt. of bulky merchandise can be carried up any gradient likely to be encountered on South African roads. The bottom boards of the body are so arranged that they can be lifted out to provide ready access to the gear-box, bearings, etc. The petrol and oil tanks are fitted each side of the driver's seat. Three sets of brakes are provided, these acting respectively on the differential shaft, the rear sprockets, and the tyres.

Digitized by Google

To the many devices for readily attaching and detaching the ignition wires to and from sparking plugs, recently described in the *Journal*, has now to be added the "Universal," of which we give illustrations herewith. It is made by La Société L'Automatique, of Paris, and is being introduced into this country by Messrs. Janvier and Pouderoux, of 9, Great Castle Street, London, W. The device consists of two parts. The one seen to the left of Fig. 1 is arranged to be permanently connected to the end of the plug, the hole 1 being provided for this

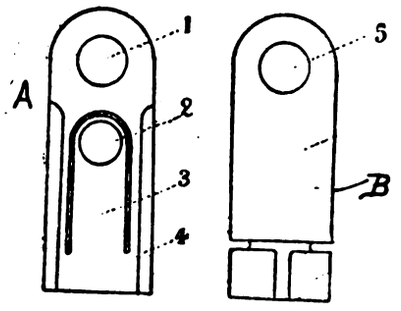


Fig. 1.

Fig. 2.

purpose. A part, 3, of the piece *A* is cut so as to act as a spring, and terminates in a small round projection, 2. The high-tension wire is attached in the usual way to the piece *B*, which is slid into *A*, the sides of which are turned over to form a guide. As *B* is slid into *A*, the spring is depressed, allowing the projection, 2, to engage with the hole, 5, a rigid connection, but one which can be immediately disengaged when necessary, being obtained. The arrangement, which, as will be seen, is exceedingly simple, is also made for use in connection with low-tension wires and terminals.

THIRTEEN omnibus companies and firms with horse-drawn vehicles on the London streets have motor-omnibuses under construction at the present time.

THE SUSSEX MOTOR ROAD CAR COMPANY, which has established a public service between Pulborough and Worthing, are now trying to extend their motor-'bus route to Hove.

THE AUTOMOBILE CORPORATION, LIMITED, has been registered with a capital of £1,000. Mr. E. A. Mackenzie is the first director, and the registered office is at 24, Queen Victoria Street, E.C.

A MEETING of the Automobile and Cycle Engineers' Institute will be held at the Grand Hotel, Birmingham, on the 21st inst., when Mr. Dugald Clerk will read a paper on "The Testing of Petrol Engines."

SINCE the Motor Car Act came into force the Kent County Council has issued nearly 2,700 licences to drivers of motor-cars and motor-cycles. The actual number of motor-cars registered at the county offices is 858, and of motor-cycles 885.

MESSRS. JOHN PRICE AND COMPANY, LIMITED, has been registered, with a capital of £1,000, to carry on the business of manufacturers and vendors of and dealers in lamps for motor-cars, etc. Registered office: Avenue Works, First Avenue, Stechford, Worcester,

REPRESENTATIVES of twenty-two municipal tramway authorities have resolved to oppose the proposals of railway companies to run motor-omnibuses unless the routes are restricted to the railway stations of the company and fixed points in the vicinity.

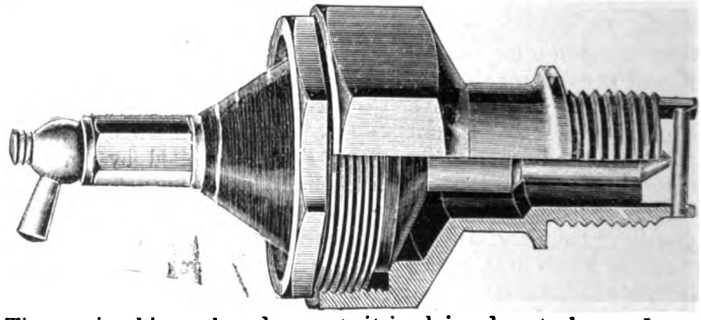
MESSRS. ALFRED HERBERT, LIMITED, of Coventry, have lately brought out a new combination turret lathe, which is of interest to motor-car builders. It is designed to bore and finish complete, including the four valve holes, the double cylinder of a 12-h.p. motor in 2¼ hours.

THE ANGLO-FRENCH MOTOR COMPANY, LIMITED, has been registered in Guernsey with a capital of £20,000.

THE Italian War Office is reported to have given out orders for ten motor-vehicles for use in connection with the commissariat department.

A NEW price list of the Bleriot lamps, to which reference was made in our report of the show at Olympia last week, has been issued by Messrs. Weldhen and Bleriot.

AN unusually large sale by auction of motor-cars and accessories commenced at the Motor House, Euston Road, N.W., on Tuesday, and was continued on the three following days.



MESSRS. J. E. HUTTON, LIMITED, have on view at their showrooms in Shaftesbury Avenue, W.C., a unique display of different models of Mercedes cars; among them are specimens of the 90, 70, 60, 40–45, 28–32, 24–28, and 18–28 h.p. cars.

THE CIVIL SERVICE MOTOR AND CYCLE AGENCY, LIMITED, of Featherstone Buildings, High Holborn, W.C., have been appointed exclusive agents (under licence from Messrs. C. S. Rolls and Co.) in London and district for the new two-cylinder 10-h.p. Minerva car.

THE Middlesex County Council are commencing the widenings in the Harrow Road at Willesden in preparation for the electric tramways from Harlesden to Wembley. The Brent Bridges are being strengthened and widened, and Deadman's Hill widening to 50 ft. will effect a vast improvement to a dangerous spot. The hill deserves its name from the motor, trap, and cycle accidents that have occurred there; but it really derived its title from the discovery a century ago of a returning party of body-snatchers, who, alarmed by a police patrol, bolted and left behind a cart load of their gruesome spoils of village cemeteries.

AT Bow Street Police-court, London, on Tuesday, Mr. Marsham was occupied with an adjourned summons against H. E. Gwinner, of Holland Villas Road, Kensington, charging him with driving a motor-car in the Green Park at a greater speed than ten miles an hour. When the case was previously before the court, it was argued that the regulations under which the proceedings were taken were *ultra vires*, as they had not been laid on the table in both Houses of Parliament. Mr. Bodkin, representing the Public Prosecutor at the adjourned hearing, submittted that for all practical purposes the regulations were tantamount to an Act of Parliament, and were perfectly good. Eventually the magistrate adjourned the case in order that he might consider his decision.

THE accompanying illustration depicts the "Amac" sparking plug recently introduced by the Aston Motor Accessories Company. It is designed in such a way as to form a very long gas pocket between the combustion chamber and the insulation

The gas in this pocket does not, it is claimed, get changed, consequently no sooting can possibly take place, either from too rich a mixture or from lubricating oil. The arrangement of the mica insulation is such that it is impossible for short circuiting to take place between the layers of mica, as the distance between the central conductor and the body of the plug will not allow it. The "missing" of motors when throttled right down does not occur, as the gas pocket always permits the new charge to reach the spark.

CORRESPONDENCE.

Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

AN INTERESTING MOTOR QUERY.

To the Editor of *The Motor-Car Journal.*

Sir,—I have been greatly interested in the discussion on the question as to why a petrol engine runs, or appears to run, so much better at night than during the day, and, moreover, have been considerably amused by the reasons advanced by some of your correspondents. Particularly so as regards the motorist who accounts for the phenomenon "by the higher atmospheric gases that come from the leafage, trees, etc., which does not show itself in the daytime. This causes a richer mixture, a better explosion, and so more power in the engine."

I hardly know whether he meant this to be taken seriously or as a joke. As I think it must be the latter, I venture to send you my contribution to the discussion. The various suggestions that have been advanced may have something to do with the engine running better at night, but it is my belief that the secret of the whole thing lies in the fact that the number plates are less in evidence at night than during the day!—Yours truly,

Farago.

THE ARRANGEMENT OF CHANGE SPEED AND BRAKE LEVERS.

To the Editor of *The Motor-Car Journal.*

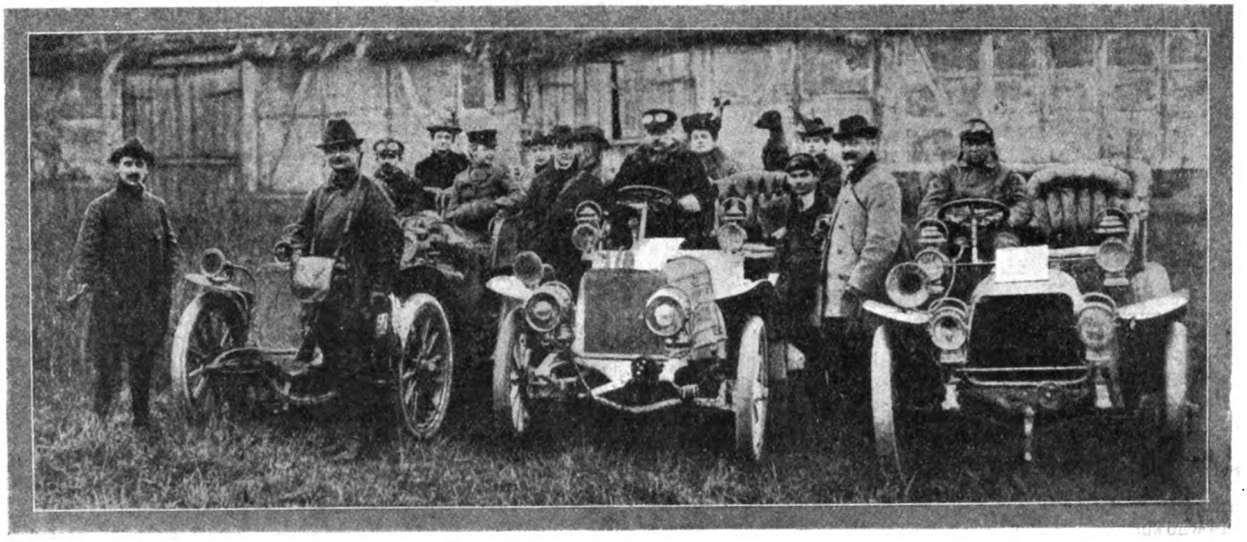
Sir,—One serious objection to the present arrangement of the controlling devices on practically all cars is that the entrance to the drivers' seat is obstructed by the change gear and brake levers, both occupants of the front seat being forced to enter and alight at the left hand side. The result is that whenever a vehicle is drawn up with its right side to a kerb, the occupants of the front seat must walk around the vehicle, perhaps through mud, every time they enter or leave. The disadvantage of this arrangement is obvious, and it seems certain that something more practical will be found in the future. In some cars this objection is overcome by mounting the change gear lever on the steering column, as in the Darracq, and placing the brake lever comparatively far back at the side of the seat. The present arrangement of the controlling devices, when the steering column has the proper tilt and height, and the levers are at a suitable distance from the seat, seems to be ideal so far as convenience of operation is concerned, but it should be quite possible to find an equally convenient arrangement that is also free from the objection of obstructing the most convenient entrance to the front seat.—Yours truly,

P. L. Winchester.

THE GRAPHITIC LUBRICATION OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to your correspondent Mr. George Gibson, and in all fairness to him, we must say we omitted reading the article to which he refers. Pure graphite should only be used, and in only small quantities, and introduced by way of the crank chamber; the ignition we use is ordinary high tension, with accumulator and Oleo plugs. Your correspondent says that graphite is a high conductor of electricity; we beg to differ, as it is generally known to be a bad conductor, and is chiefly used by electricians as resistance. In conclusion, we have used graphite as a lubricant with great success, both in cylinders, gear-box, etc.—Yours truly,



The Glasgow Motor-tyre Company.

MOTORING FOR THE MAN OF MODERATE MEANS.

To the Editor of *The Motor-Car Journal.*

Sir,—It is to be feared that the progress of motoring as a fashionable pastime may have some incidental results not for the ultimate good of the industry, at least if its plutocratic votaries rush into print about their expenses. Were horses a novelty, the publication of the outlays on them by wealthy sportsmen would be quite enough to deter the professional man, say, of moderate means, from indulging in such a costly luxury. The idea that motor-cars are necessarily costly is quite enough to frighten a large number of would-be motorists. The other day I heard the owner of two carriages and several horses lament that a car would be beyond his means, and he was quite surprised on hearing the probable actual cost of a small car, which was all he aspired to. Needless to say, the information left him a probable convert. The fact cannot be too often repeated that the cost of motoring is just what the motorist likes to make it. If it is worth his while to economise, he can run his car cheaper than any horse—if it is a good one; while if he is on speed intent, and likes to hand over all his troubles to a *mecanicien*, he can spend anything he likes. But it is the experiences of the former class that are most interesting and instructive.—Yours truly,

J. F. Fothergill.

A Motor Shooting Party in Austria.

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

To the Editor of *The Motor-Car Journal.*

Sir,—I was much interested in a letter in the *Journal* of the 4th inst., signed "Electrical Engineer." I would be exceedingly obliged if he will inform me where to obtain such a magneto as he describes. My car is a four-cylinder 16-24-h.p. Would your correspondent also inform me whether the magneto has to be driven at the speed of the engine shaft or at the same speed as the half-time shaft? Also whether the magneto has a rotary or rocking motion.—Yours truly,

C. G. S.

To the Editor of *The Motor-Car Journal.*

Sir,—In the *Journal* of February 4th, "Electrical Engineer" says, "A small magneto driven off the engine will do the work of the accumulator, requires no attention, and will work with the common trembler coil and sparking plug." There must be hundreds of your readers who are simply longing for the advent of such a fitment, and would no doubt be grateful for full information as to where it may be obtained, how fitted, cost, etc. Will "Electrical Engineer" kindly oblige, and earn the gratitude of all who, like myself, are heartily sick of accumulators.—Yours truly,

Interested.

CARS FOR MEDICAL MEN.

To the Editor of *The Motor-Car Journal.*

Sir,—I wonder if any of your readers would inform me of the most reliable silent petrol landaulet suitable for a medical man in

Digitized by Google

London, the price of same and cost of upkeep. Also, I should be glad to know of a good electric landaulette of moderate cost, and upkeep of same.—Yours truly,

MEDICUS.

AN ELECTRIC GOVERNOR FOR PETROL ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the above, described in the *Journal* of the 4th inst., I find it is a very great improvement to have the switch connected with the clutch pedal. When this is done there is no racing on pulling the clutch out for changing speeds or reversing, and in travelling down hills the engine slows at once on depressing the pedal. But it is still necessary to have another switch in the earth wire, so as to put the governor in action when you are out of the car and your foot is off the clutch pedal. This was suggested to me by a correspondent in another paper, and I am delighted with the improvement. May I also mention the absolute necessity of having platinum contacts on the governors, as otherwise it is useless? I ought to state that the governor is provisionally protected.—Yours truly,

GEO. A. E. ROBERTS.

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Electrical Engineer" states that if an accumulator cannot be sent to a charging station it ought not to be used. I in no way agree with him. I use the Boron cells for accumulators for both lighting and ignition. My man does not find it at all a messy job, although if the solutions are mixed in quantities it takes a little time. I solder the wires to the zincs so as to avoid screw connections. And although, if a dynamo was conveniently near, I should no doubt use it, yet I consider that for the country primary batteries are a very great convenience. Consequently, I should strongly advise anyone, where there is a difficulty in getting accumulators charged, to have four or five cells; I now use four only, and I keep charged up eighteen accumulators used for ignition purposes in fifteen cylinders, and for seven small lights. I may say that when I first thought of using accumulators I inquired from electrical engineers whether it was feasible to get enough current for the above number of cylinders and small 4-volt lights, and was told it would be a failure. I am very pleased I did not take their advice, as I find it a success and quite satisfactory. I will leave it to others to decide whether "Electrical Engineer's" theory or my practice is most likely to be correct, but I am satisfied after three years' use.—Yours truly,

ERNEST ESTCOURT.

MOTOR TUITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Sidney R. Harbert's letter in your issue of the 4th, I beg to differ on a few points. Motor tuition is, I will admit, a mistake in some instances, but it is not the general rule to teach men on an obsolete car. It is not necessary for a man to have much workshop experience. There are very few private car owners who have a workshop fitted up. A man with a mechanical turn of mind is capable of learning to drive and do running repairs in a month, particularly if he is a constant reader of the *Journal*, from which there is some valuable information to be picked up.

A man who has had some experience in traffic driving, such as a coachman, is more likely to become a good chauffeur than a man that has spent most of his time in a workshop.—Yours truly,

V. W. FARMER.

NON-SKIDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading with a good deal of interest the correspondence in your columns concerning the various non-skid devices recommended—and otherwise. But there is one form of non-skid which, after personal experience, I consider it simply a public duty to warn my motoring brethren against. I refer to the tyres advertised as "newly retreaded, fitted non-skid leather covers, never used since retreaded." I was foolish enough to buy a pair of these. They were quite pretty and substantial-looking—to look at; but a week's running settled them both. One was a worn-out old tyre, badly separated at the bead, the other had a bad burst through the middle of the tread; a neat canvas lining inside and the leather tread outside effectually concealed these defects. So "on approval" is of very little use. Instead of being vulcanised on the leather cover appeared to be fixed with office gum or some equally powerful adherent, while a bit of tape was stuck round the edge by the beading. Once the leather was loosened it stripped off easily from the cover by slipping the thumb round the tyre. Any old worn-out covers appear to be used, covered inside with canvas, outside with "'non-skid leather bands," and advertised for sale. The process is simple, and, I should imagine, profitable.—Yours truly,

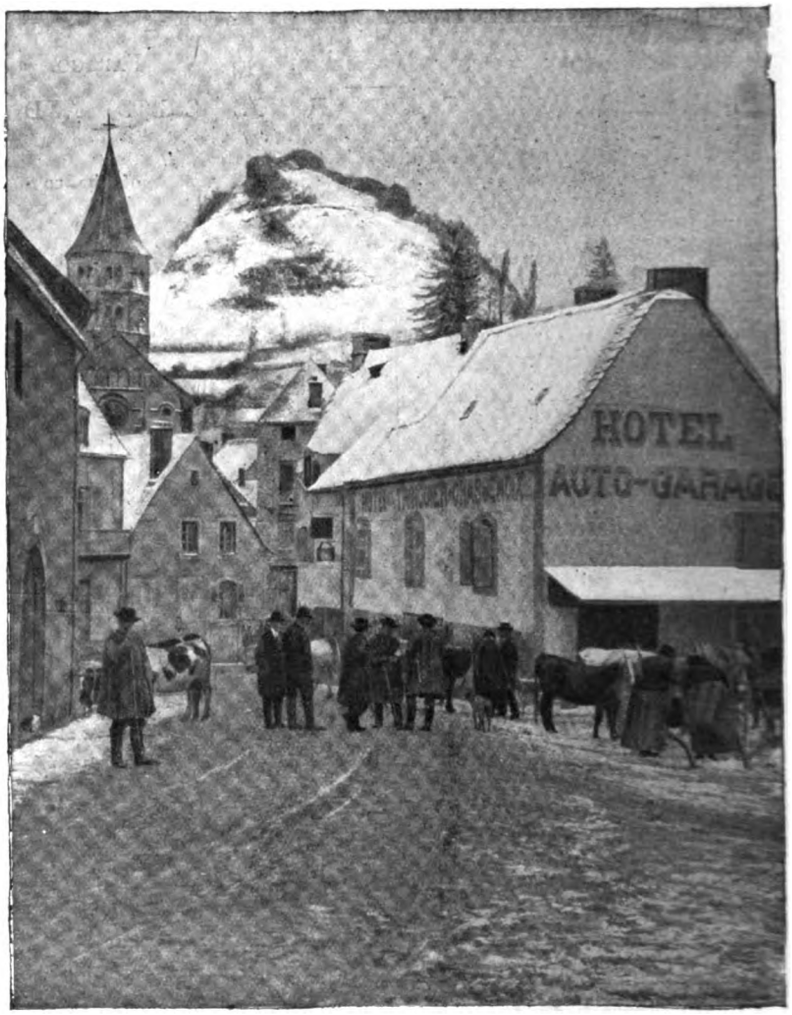
HARRY LUPTON.

A SCREW-DOWN GREASE CUP was found by a working man and taken to Messrs. Ingersoll, Marter and Co.'s Garage, 45, Mitcham Lane, Streatham, on Saturday. The owner can have it on application to the firm.

GOVERNOR TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to know if you or any of your readers would give me your opinion on the following. I have a 1904 Argyll 10-h.p. car, two cylinders; when it is running with the lever that governs the throttle in the last notch but one, it goes at about twelve miles an hour and exceedingly quiet; if I move the lever on to the last notch, *i.e.*, when the spring of the governor is at its highest, the car at once puts on about eight or ten miles per hour and a terrible row. It is impossible for me to get any medium between the last two notches.—Yours truly,



W. WRIGHT.

TRI-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the correspondence on the above in your paper it appears to me that the present useful tri-car has been evolved from what has proved to be—from trials and discussions—the essential requirements for carrying two persons at a maximum of speed and comfort and a minimum of cost. Such requirements as adapted by most makers are undoubtedly about 5-h.p., water cooling, two speeds, chain drive and spring frame. Personally I would like to have a reverse, which does not appear to be general. But what interests me most at present is the statement by Mr. Saunders, in one of his letters, of a reliable light four-wheeled car for from £75 to £80. I should be extremely obliged if he would kindly let me know, through your columns, where such a new car can be obtained, as I have been on the look-out for one at this price for a long time.—Yours truly

The Olympia Motor-Car Show.

On Friday, the 10th inst., the motor-car exhibition organised by the Society of Motor Traders and Manufacturers at Olympia, London, was opened. It will close to-day (Saturday), and the following notes on the leading exhibits will be of general interest. The report will be continued in our next issue.

General View of the Exhibition.

Messrs. T. Coulthard and Company, Limited, exhibit one of their latest steam wagons, designed to comply with the new Local Government Board regulations. It is intended for loads up to about five tons. The main frame is of channel steel, having strong cross-channel braces, and constructed to carry all the machinery, the boiler, and the water tank. The boiler is of the vertical fire-tube type; the upper tube plate and the fire box crown are stayed with a central tube of sufficient diameter to form a central firing shoot, and a door is provided for clearing the fire. The shell is arranged with two bolted joints, so that the upper half may be readily removed for inspecting and cleaning the tubes. The fire bars are of the hinged type, so arranged that when necessary the fires can be instantly dropped. The main boiler feed is by a dust-proof ram pump, directly connected to the engine; a steam pump is fitted as emergency feed. The engine is of the compound type, fitted with link reversing gear, and giving approximately 30-b.h.p. A special valve is provided, whereby high pressure steam can instantly be passed to the low pressure cylinder. An important feature, giving highly satisfactory results, is the method of suspending the engine and casing in the frame. The cylinder end of the combined engine and gear casing is secured to the frame by a double knuckle joint, whilst the other end is carried by the side channels of the frame in large overhung bushes, in spherical bearings, the bushes forming the bearings for the compensating shaft and sleeve. This method of suspension ensures perfect alignment of the various shafts, notwithstanding any distortion of the frame owing to load or road effects. The transmission of the power from the differential shaft to the rear wheels is by Renold silent chain, the chain wheels being fastened to the road wheels by a triangular attachment, whereby the drive is taken directly to the felloes of the wheels. Messrs. Coulthard have also recently taken up the construction of petrol lorries, and show one designed for loads up to four and a half tons. We give an illustration of the new vehicle in Fig. 1. The main frame is of channel

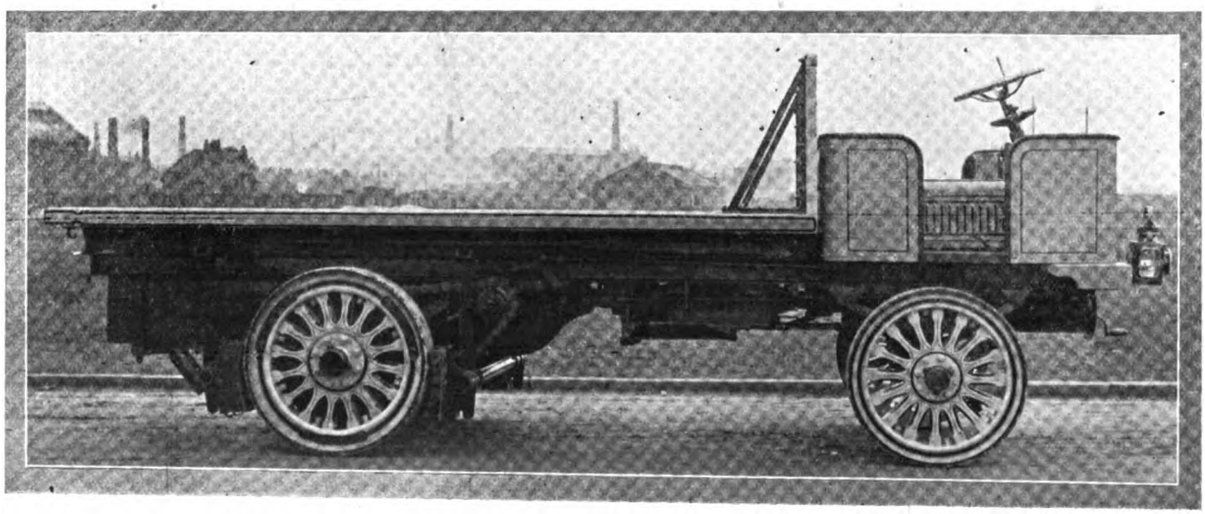

Fig. 1.—The Coulthard 4½-ton Petrol Lorry.

Digitized by Google

steel, with strong cross channel braces, of a sufficient strength to carry the maximum load without undue distortion. The motor has four vertical cylinders, 110 mm. bore by 110 mm. stroke, and gives 26–30-h.p. It is fitted with mechanically-operated valves, low-tension magneto ignition, automatic carburettor, and a governor acting direct on the inlet. A Soames change-speed gear is provided, giving three forward speeds and one reverse, the maximum being eight miles per hour at the normal speed of the engine. The change-speed gear is automatically locked, so that it is impossible for the gears to change except through the operating levers. These are in turn so connected with the engine clutch that it is impossible

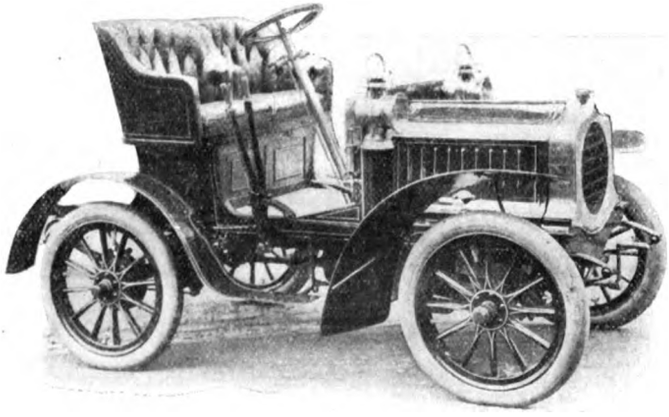

Fig. 2.—The Speedwell 6-h.p. Car.

for the driver to alter his speed without throwing his engine clutch out of gear. The differential gear is of the bevel wheel type, but the shaft is carried right through the sleeve, and provided at the sleeve end with a means for locking the gear. The rear road wheels are driven by side roller chains, the chain wheels being attached to the wheels by means of triangular attachments, whereby the drive is taken direct to the felloes.

The Speedwell Motor and Engineering Company, Limited, have an interesting display of the "Speedwell" petrol cars which have been introduced to meet the demand for vehicles at a moderate price. The 6-h.p. two-seated vehicle, depicted in Fig. 2 has been improved almost beyond recognition, and amongst the improvements to be found are the following:—New Speedwell motor, with a bore of 90 mm. and a stroke of 110 mm., mechanically-operated inlet and exhaust valve, automatic carburettor with piston control, governor, rotary commutator fixed on vertical spindle rendering it easy of access, new form of bonnet and ribbed-pipe radiator, the latter being fitted in a self-contained tank, longer *chassis*, larger wheels and tyres. Notwithstanding all these improvements no addition has been made in the price of the car, for which a very large demand will doubtless be experienced during the coming season. The new shaped bonnet and radiator also forms a distinguishing feature of the 10 and 12-h.p. double-cylinder cars, examples of which are to be seen. The *chassis* of the 12-h.p. vehicle is well worthy of inspection. The frame is of pressed steel construction, and we note that not only are all brackets and joints riveted, but also electrically welded to the frame. The transmission in all the cars is by cardan shaft and bevel gear to a well-stayed live axle. The Speedwell Company also exhibit a 24-28-h.p. Leon Bollee car and a *chassis* of the new 9-h.p. Gardner-Serpollet steam car. Although we illustrated and described the latter in our report of the Paris *Salon* it may be of interest to mention that the new model outwardly bears a close resemblance to a petrol car. The engine and fuel and water feeding arrangements are located in the fore part of the frame under a bonnet, the raising of which gives ready access to the various parts. The engine, which comprises four horizontal cylinders—two on each side of the crank-shaft—is now placed across the frame, the power being conveyed to the

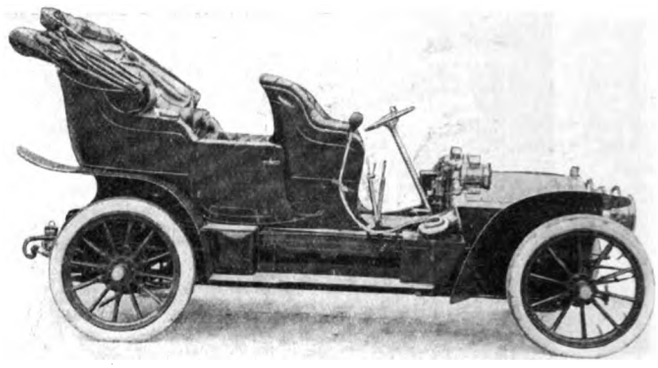

Fig. 3.—The Germain 24-32-h.p. "Tonneau Royal."

rear axle by a cardan shaft and bevel gear, in place of the single chain drive of last year. The old condenser and its piping have been replaced by a radiator placed in the front opening of the bonnet, a strong current of air being drawn through the same by means of a fan. The steam generator is enclosed in a chest at the rear, and is hardly noticeable; its weight and volume is much smaller than hitherto, these advantages being the result of an improvement in the fuel-burning arrangements. Ordinary petroleum is, of course, used as fuel, and provision is made whereby the pilot burner may be kept going for days together on a very low consumption and without danger to the tubes of the generator. One advantage of placing the engine in front is that the load is now about equally divided on the front and rear axles.

Mr. Theo. Masui has a large stand on which a number of the latest types of Germain cars are staged. As a result of the satisfaction with separate steel cylinders for the engine, these are being retained. The cylinder heads are of cast iron, while the water jackets are of brass. Three models are being made—16-h.p., 24-h.p., 35-h.p.—each with four-cylinder engines. Improvements have been effected in the water-cooling arrangements; the position of the pump has also been altered, it being now at the rear of the engine under the bonnet, and driven by friction off the flywheel. The carburettor is equipped with a jacket through which hot water can be circulated, means being provided for controlling the circulation. The inlet valves are provided with a device controlled by a pedal, by means of which the lift of the same can be varied and consequently the speed of the motor regulated. Both battery and Eisemann high-

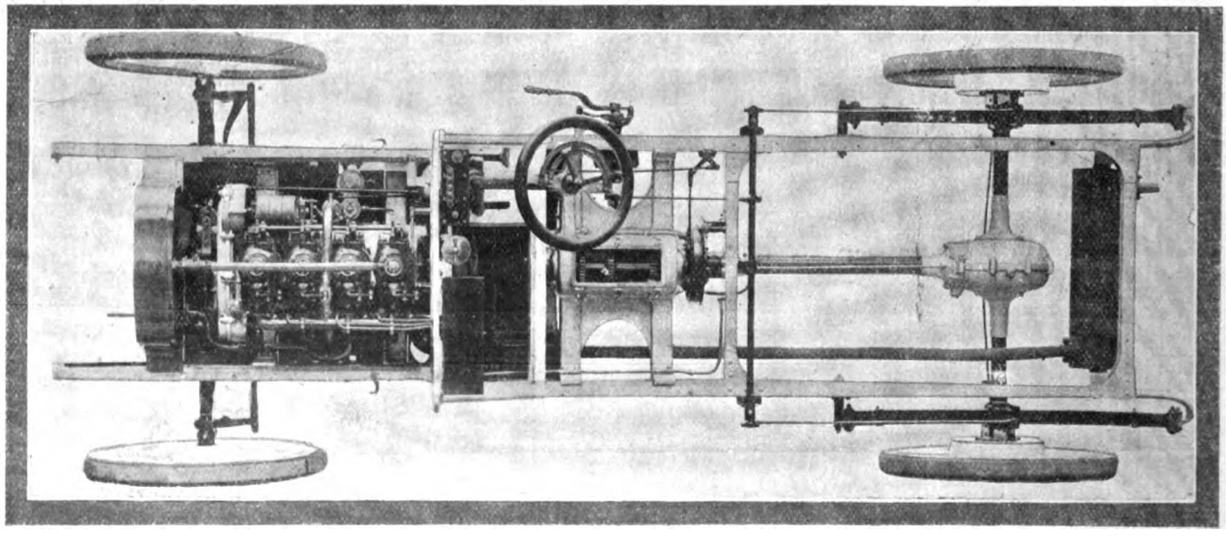

Fig. 4.—Plan View of Chassis of Hurtu 16-20-h.p. Car. (*See page* 1061.)

Digitized by Google

tension magneto ignition are fitted, one advance and retarding lever controlling both systems. The frame is now of pressed steel construction and, with push pedals and wheel control, the vehicles are up-to-date in every respect, as an examination of the complete cars on view will show. One of these is a magnificent 24-h.p. Pullman car, with inside accommodation for six persons; a 24-h.p. side entrance Royal tonneau, Fig 3, is also

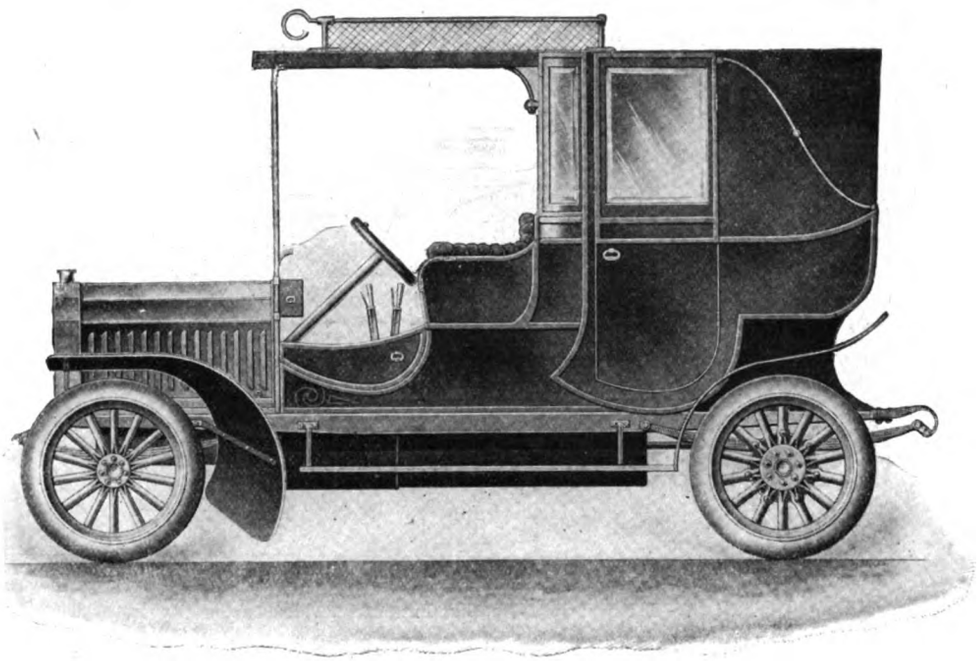

Fig. 5.—The Dennis 20-h.p. Landaulet.

to be seen, as well as a 16-h.p. coupe; the latter can accommodate four persons inside and is finished in yellow with black stripes. Altogether the Germain cars are noticeable not only as regards the high-class nature of the mechanical work, but also for the excellent bodies mounted thereon.

Messrs. E. AND H. HORA, LIMITED, the British agents for the Hurtu cars, exhibit a range of these vehicles which appear to be on soundly constructed lines. Under the guidance of Mr. Wm. M. Hodges we first inspected the *chassis* of the 16-20-h.p. four-cylinder Hurtu (Fig. 4). The vehicles have pressed steel frames narrowed at the front to increase the lock of the steering wheels. The engines have separate cylinders 85 mm. bore by 120 mm. stroke; the valves are mechanically actuated off one cam shaft, the inlets being arranged in the cylinder heads. A noticeable feature of the arrangement is that by undoing three nuts the valves together with their operating tappets and rods can be instantly taken out. The ignition is by coil and accumulator and by gear-driven magneto, both being controlled by one lever. Four speeds forward and a reverse, with direct drive on top speed, are provided. The gear-box, which is supported directly on the main frame, is provided with ball bearings. The transmission is by enclosed cardan shaft to the live rear axle. All the brakes are of the metal-to-metal expanding type. To prevent strain on the engine or gear, a universal joint is provided on the clutch shaft. The radiator is of the honeycomb type with belt-operated fan. The steering bar is placed behind the front axle, and is consequently protected. The 10-h.p. car is practically a replica of the larger vehicle, the main difference being that the engine has only two instead of four cylinders and that only three forward speeds are provided. Examples of the 8-h.p. single-cylinder two-seated car are also on view, one being fitted with a coupe body, rendering it suitable for the use of medical men. A tonneau body is shown in which is incorporated an ingenious method of obtaining a side-entrance vehicle on a short *chassis*. The backs of the front bucket seats are separate from the latter and are so combined with the side doors to the rear seats, that as the doors are opened the back of the bucket swings round and gives room for the passengers to alight. Messrs. Hora also display a 34-seated body for a motor-omnibus, this being one of a series they are building for Messrs. Tilling.

For the 1905 season MESSRS. DENNIS BROTHERS, LIMITED, are

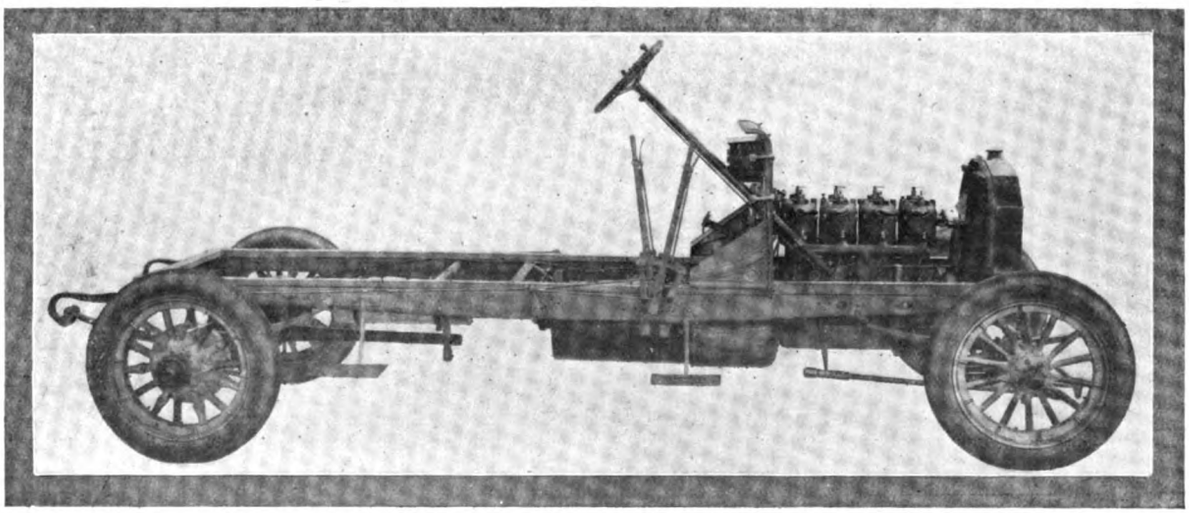

Fig. 6.—Chassis of Dennis 20-h.p. Car.

building two types of cars, 14-h.p. and 20-h.p., on the *chassis* of which various types of bodies can be fitted. At the show they have a large stand on which we first inspected a 20-h.p. *chassis*, Fig. 6, provided with pressed steel frame and the latest type of Aster four-cylinder engine, having separate cylinders and mechanically-operated valves arranged on opposite sides. The radiator is of the honeycomb type with air-inducing fan, and we notice that in accordance with modern practice the steering-bar is now

Digitized by Google

placed behind the axle. The power is transmitted through a leather-faced cone clutch to a gear-box giving three forward speeds and a reverse, with direct drive on top speed. The Dennis spring-driving arrangement between the gear-box and the cardan shaft is still retained, as is also the worm drive on to the rear live axle. The rear road wheels are not mounted on the live axle proper but on the casing of the latter, and receive the power through jaw clutches in the hubs. In this way the live axle is not called upon to carry the weight of the car. The usual dumb irons or spring hangers are replaced by halves of semi-elliptic springs, which greatly increase the easy riding qualities of the car. The mixture is furnished by an automatic carburettor, so that the engine is entirely controlled by two levers, one actuated by hand, varying the ignition, and the other, worked by the foot, acting on the throttle. There are several other interesting details in the latest Dennis car, including an ingenious mechanically-operated lubricator, which pressure on our space prevents us dealing with at length. A complete 20-h.p. car is seen in a very handsome side-entrance double phaeton with canopy and glass panel at front and rear. So satisfied are Messrs. Dennis with the results given by the worm drive that they are now fitting this to their 14-h.p. double-cylinder cars. These follow in general arrangement the lines adopted in the four-cylinder vehicles, and that they are exceedingly quiet in operation was brought home to us in the course of a short run on a stylish laudaulet just out of the works. Messrs. Dennis, while devoting much attention to pleasure cars, are not neglecting commercial vehicles, and have on view a 14-h.p. double-cylinder delivery van, built for Messrs. Peak, Frean and Company, and designed for loads of from 20 to 30 cwt. They also exhibit the *chassis* of a thirty-six seated double-deck petrol 'bus they are building for Messrs. Tilling. This has a long channel steel frame, the motive power being supplied by a 20-h.p. Aster engine. The transmission is on the same lines as those adopted in the pleasure cars—by spring drive and worm gear to the rear live axle. The latter is not only provided with radius rods but also with vertical guides. The various parts of the mechanism have been made suitably strong for the hard work they will be called upon to perform. Heavy petrol lorries are also receiving the attention of Messrs. Dennis, who are to be congratulated on their enterprise.

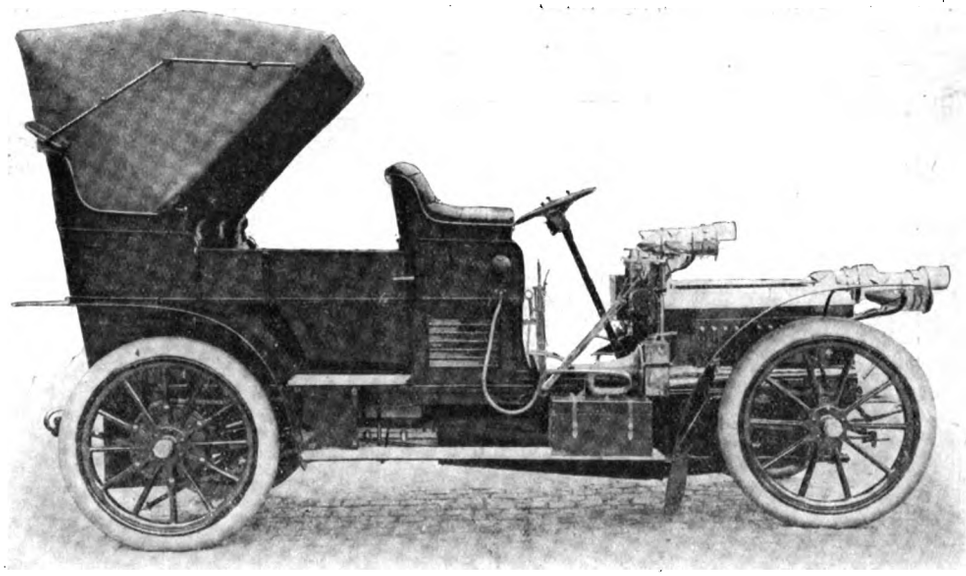

Fig. 7.—The Pipe 18-22-h.p. Side-Entrance Double Phaeton

The C.G.V. and Pipe cars are to be seen at the stand of the London Motor Garage, Limited. Of the former a *chassis* of the 1905 25-h.p. car is exhibited. The frame consists of a square steel tube filled with wood. The motor comprises four separate cylinders with mechanically-operated inlet valves. Both the pump and high-tension magneto are gear-driven. The carburettor is on the double-jet principle, with an automatic valve which closes the larger jet and opens the smaller when the engine is running at a low speed. The flywheel has its arms made in the form of a fan. The lubrication of the engine is effected be oil circulated by a pump. The clutch is of an improved type, thy aluminium male clutch member having a layer of rubber placed beneath the leather. A double cardan shaft is introduced on the shaft. between the clutch and the gear-box. The latter gives four speeds and reverse, with direct drive on the fourth; in it ball bearings are utilised. A handsome 25-h.p. C.G.V. side-entrance limousine, with body by Hoopers, is also on view. Accommodation is provided for four inside passengers, all of whom face forward. Of the Pipe cars, Fig. 7, the exhibit comprises a *chassis* of the 18-24-h.p. model

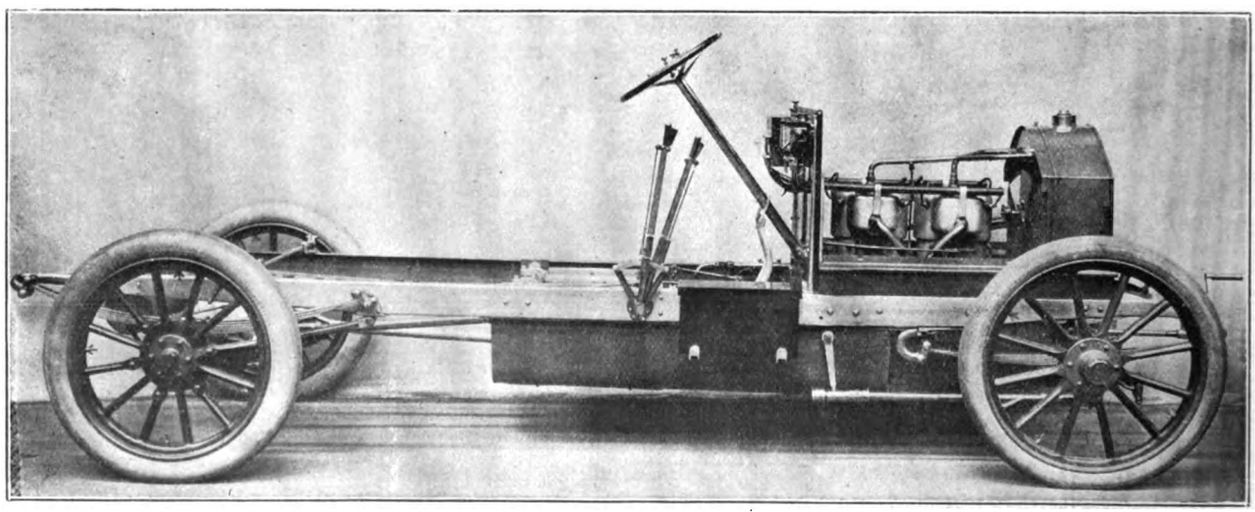

Fig. 8.—Chassis of Pivot 24-h.p. Car (*see* page 1063).

Digitized by Google

and a complete limousine of similar power. The main new departure is found in the engine, which comprises four cylinders, cast in two pairs. The inlet and exhaust valves are all mechanically actuated off separate cam shafts. The valves are arranged in a somewhat unusual way—they open directly into the explosion chamber, not in a vertical line, as usual, but at an angle of 45 deg., the valve stems being actuated by rods and tappets. The radiator is of the framed ribbed tube variety, the flywheel having its spokes arranged to act as a fan in drawing a current of air through the cooler. The clutch is of the metal-to-metal type; the gear-box, the shafts of which run on ball bearings, is arranged to give four speeds forward and a reverse. The Pipe cars have already an excellent reputation both in Belgium and England, which should be well maintained by the new models, which, in addition to the 18-22-h.p. above referred to, include 14-h.p. and 35-h.p. cars, both with four-cylinder engines.

Dixi Motors, Limited, exhibit three models of the increasingly popular Dixi cars. We first inspected a handsome 24-30-h.p. side-entrance double phaeton with accommodation for five persons at the rear all facing forward. The *chassis* is of pressed steel construction; the car is chain driven and is provided with a four-cylinder engine having cylinders 110 mm. diameter by 130 mm. stroke. Both high-tension magneto and coil and accumulator ignition work with the same plugs, and the mixture is furnished by an automatic carburettor, and, with wheel control and push pedals, the vehicle may be classed among the high-grade types on the market at the present time. Another interesting car is a 12-15-h.p. four-cylinder car with frame of tubular construction. The transmission is by cardan shaft and bevel gear to a live axle. A feature of the four-cylinder motor is that while the valves are arranged on opposite sides of the cylinders, the inlets being in the heads, they are all operated by one cam shaft. The tappet rods actuating the inlets pass right through the walls of the head of the cylinder and operate the valves themselves by pivoted tappets. The third Dixi car on view is a two-cylinder one of 6-8-h.p.; the body is in the form of a hansom cab, there being accommodation for three persons including the driver, and a large amount of luggage on the platform. At the stand of the Dixi Company is also to be seen a 24-h.p. Pivot *chassis* and a handsome limousine coupe of the same power. The vehicles, while not comprising any startling deviation from standard practice, show evidence of careful construction. The pressed steel frame is mounted on equal sized artillery wheels running on ball bearings. The motor has mechanically operated valves, the inlet and exhaust being on opposite sides. Magneto ignition, automatic carburettor, framed radiator with vertical gilled tubes, and induced draught by means of a fan-shaped fly-wheel, are other features of the car. The water circulation is on the thermo-syphon system, no pump being employed. Four speeds and a reverse are provided, the transmission being through a cardan shaft and live axle. A view of the *chassis* is given in Fig. 8.

Messrs. Mann and Overtons, Limited, exhibit examples of the 8-h.p. and 16-20-h.p. Richard-Brasier cars, for which they are British agents. The 1905 models of this well-known vehicle comprise 8-h.p. double cylinder, and 12-15-h.p., 16-20-h.p., and 24-30-h.p. four-cylinder cars. Except that the 8-h.p. vehicle has only three speeds forward in addition to the reverse, while the others have four, the following remarks apply to all four vehicles. The main frame is of stamped steel, the engine and gear being supported on a secondary frame of tubular construction. The cylinders, which are cast in pairs, have mechanically-operated inlet valves, these being set on the opposite side to the exhaust valves. Magneto ignition is being retained, as is also the thermo-syphon system of water circulation in conjunction with a fan-cooled radiator. We noticed that the radiating surface has been increased and the fan improved. The carburettor is an automatic air-regulation one of the company's own patent; it is exhaust-jacketed and comprises two spraying nozzles set at an angle to each other, similarly to twin burners in acetylene lamps. The transmission is by means of a cardan shaft and bevel gear on to a live axle. A double universal joint is introduced between the engine and gear-box, this not only relieving the shafts of the latter of all strain, but permitting the clutch to be dismounted without interfering with the gear-box in any way. Enclosed internally-expanding metal-to-metal brakes are now fitted to the hubs of the rear wheels, while a point which will appeal to all who have suffered from "back kicks" of the motor, owing to the ignition not having been retarded, is an arrangement whereby the act of putting the starting handle into gear at the same time automatically retards the ignition; the moment the handle is released the ignition returns to its normal position. Long springs are employed, and we notice that the Truffault anti-shook device has been adopted. The frames are of sufficient length to allow roomy side entrance bodies to be fitted. Messrs. Mann and Overtons have also acquired the British agency for the "Unic" cars of the new firm of Messrs. Georges Richard and Co., and exhibit a 12-h.p. *chassis*. The feature of the vehicle (Fig. 9) is that the parts are so placed that almost any one can be taken off without disturbing another, it being this feature of simplicity and accessibility that has suggested the name to the vehicle. The frame is of pressed steel, narrowed in front to allow of a large lock on the wheels. The car is made in two lengths, one having a wheelbase of 6 ft. 2½ in. and the other 7 ft. 10½ in.; a side-entrance body can be fitted to the latter. The two cylinders of the engine are in one casting; the bore and stroke is 100 mm. bore by 110 mm. stroke, giving approximately 13-h.p. on the brake. The valves are mechanically operated. The ignition tappets for each cylinder are mounted on two plugs which cover the admission valves. These plugs are held down by a cross-piece, as are also the plugs over the exhaust valves, so that by undoing two nuts all the four valves and the whole of the ignition tappets can be taken out. The ignition is by low-tension magneto, driven by gear wheels off the half-time shaft on the carburettor side. One of the features is that it is placed upside down, which has the advantages of giving free access to the valves and at the same time the magnets are a long way removed from the heat of the engine. The shaft that drives it has a dog clutch similar to that used for the direct drive in the gear-box, so that by undoing four screws which fix down the magneto this can be entirely removed without touching any other part of the car. On the starting handle shaft a lever system is introduced, so that as the handle is engaged with the crank-shaft the ignition is automatically retarded. The pump is driven from the same shaft as the magneto. The radiator is combined with the water tank, which being placed above the engine ensures a perfect circulation, even should the pump fail from any cause. The carburettor is of a special type and entirely automatic. This is obtained by means of a float in a petrol float chamber, which opens a supplementary air valve according to the speed of the engine. By the inertia of the liquid the float is all absolutely

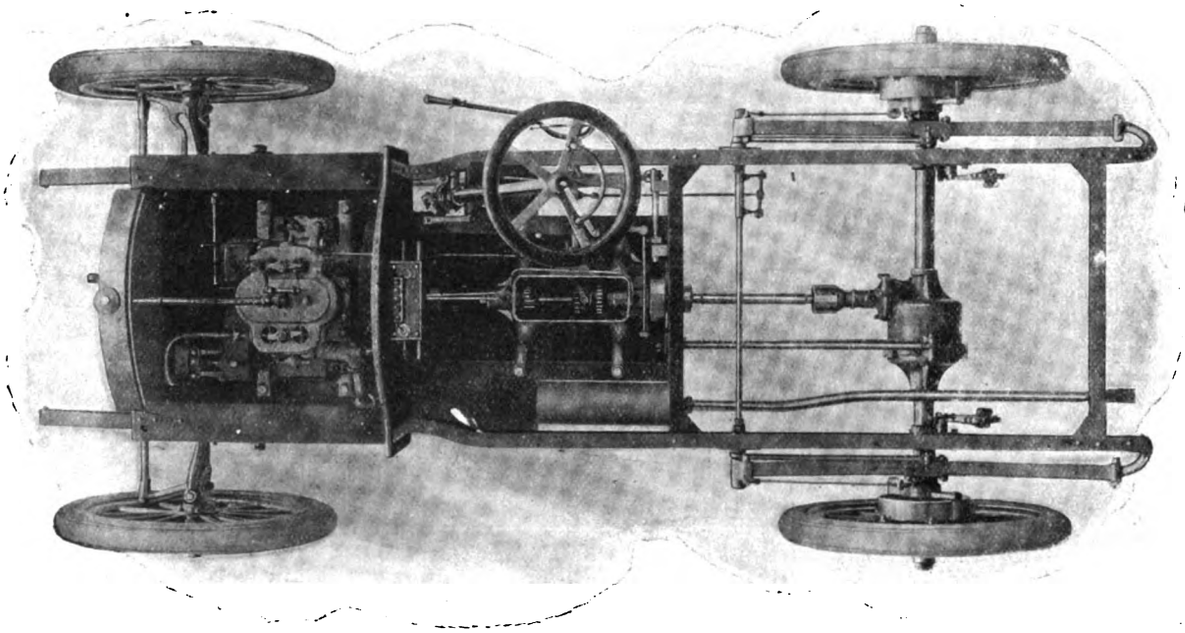

Fig. 9.—Plan of Chassis of "Unic" 12-h.p. Car.

Digitized by Google

synchronised, according to the vacuum produced by the pistons. A centrifugal governor is fitted, acting on the admission, both foot and hand control of the same being provided. The power is transmitted through a leather-faced cone clutch and a double cardan joint to a gear-box giving three speeds and a reverse with a direct drive on the top speed. The gears are placed in the reverse direction to that usually employed, in such a manner that the idle shaft is running at about one-third the speed of the engine. A cardan shaft takes the drive from the gear-box to the live axle. The latter is kept in place by two stay rods, so that the wheels are always in line. The lifting strain which the cardan produces is taken up by two rods, which prevent the axle from twisting. In addition to the foregoing, specimens of the Lempereur non-skid, the Simplex low tension ignition device and the Aeros buffer spring, all of which have been described in the *Journal*, are to be seen at this stand.

Mr. ADAMS is demonstrating the quick lift and short looking motor jack described in our report of the show at the Crystal Palace. Messrs. JOSEPH KAYE AND SONS, LIMITED, make a feature of seamless serrated petrol squirt cans, lubricating oil cans and oil economisers. Office fittings and card index systems applicable for firms in the automobile business are exhibited by the TRADING AND MANUFACTURING COMPANY, LIMITED. Messrs. LINTINE AND COMPANY have a show of "Radium" motor-lamps and motor accessories generally. LEE'S PATENT TREAD COMPANY have on view at the stand of Messrs. McNeil, Hutchison and Company the spiral non-slip treads referred to in our issue of the 4th inst.

The H. F. vulcanisers are shown by Messrs. HARVEY FROST AND CO. They include the H.F. "Standard" vulcaniser, which embodies the essential feature of treating the repair of covers from the inside as well as the outside; the H.F. "Car" vulcaniser, a very compact little appliance for carrying on car for use in cases of emergency on the road, and the "Re-Treader" appliance, a comprehensive machine, designed for work-

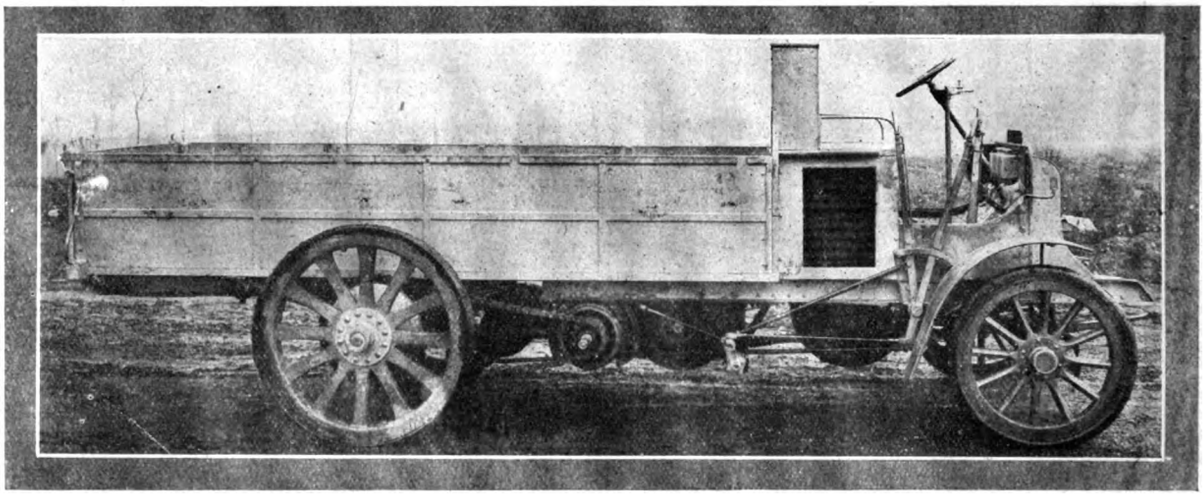

Fig. 10.—The Wolseley 20-h.p. 2-ton Petrol Lorry.

shop or factory. The latter has particular features and advantages, and practically embraces, in its compact and portable form, all the needed essentials of a re-rubbering appliance, while being most handy and economical in use, and thoroughly successful in its execution of large repairs, or of re-treading at one operation. The trade will be specially interested in this appliance, which does away with many parts and connections embodied in previous appliances, and offers every advantage to the user, with perfect repair work speedily executed on a large scale.

Some splendid specimens of carriage work are exhibited by Messrs. THRUPP AND MABERLY—one of the first carriage builders to recognise the coming of the car. A tonneau limousine mounted on a 10-h.p. Renault is a conspicuous example of high-class finish, while examples of the Roi des Belges coupé limousine, "Siamese" tonneau, and landaulet give the firm opportunities of demonstrating their position in the trade. An improved Cape cart hood which can be fitted to either a side or rear entrance tonneau is shown. When the hood is up the riders are protected from rain or sun; when it is down the device provides an effective wind and dust screen.

Mr. STANLEY W. ANDREWS, whose name has become familiar to motorists by reason of the "Stanley Perfect Silencer," is developing a business as agent for accessories. Already he has secured several good lines in honeycomb radiators, water circulating pumps, lubricators, etc. Among the minor exhibits here is a reservoir stopper permitting instantaneous opening and closing. In electrical accessories, too, Mr. Andrews makes a good start with several types of plugs, wire terminals, high and low tension wiring and the like, as well as the "Electricia" accumulator fitted with a patent gas valve which makes it impossible for the acid to be thrown out. The acid cannot pass further than the second compartment, and any gas generated passes freely to the open air. But the chief exhibit at this stand is the "Stanley Perfect Silencer," which is claimed to be efficient, silent, a reducer of vibration and free from back pressure. It was described in our issue of December 31st.

Messrs. W. AND A. BATES, LIMITED, make a display of motor-car and motor-cycle tyres, and have an extensive assortment of goods connected with the repair of motor tyres.

Among the insurance companies taking advantage of the occasion to draw attention to their policies for motor-cars and their owners are the CAR AND GENERAL INSURANCE CORPORATION, LIMITED, which also takes motor-boats into its calculations; and the GENERAL ACCIDENT ASSURANCE CORPORATION, LIMITED, which has a special motor department under the management of Mr. Alfred Nixon.

THE STERN-SONNEBORN COMPANY have their customary complete show of oils, lubricants and lubricators, and among the excellent new showcards introduced for the 1905 season is one drawing attention to the distinction achieved by their exhibit at the St. Louis Exhibition. "Speedoline" motor oils and greases are shown by Mr. C. WHITE. The "Vacuum" mobiloils, motor greases and graphite grease attract visitors to the stand of the VACUUM OIL COMPANY, LIMITED, which has been attending to the special requirements of motorists in this direction. The ANGLO-AMERICAN OIL COMPANY, LIMITED, emphasises the merits of Pratt's Motor Spirit, supplied in improved cans to meet Government regulations. The company point with pride to the fact that the 5,000 miles trial of the Siddeley car was done on 309½ gallons of Pratt's motor spirit. Lubricating oils are also part of the Anglo-American Company's display. Bowley's motor spirit, the "Champion" motor oils, "Gearolease" and motor lubricants of various kinds are shown by Messrs. S. BOWLEY AND SON, who exhibit a large red can, the colour being originally used by them to distinguish Bowley's spirit from other makes of motor spirit. The firm's greases and lubricants are of standard quality and purity.

The "Billet" non-skid and puncture preventer is on the stand of the Civil Service Motor and Cycle Agency. This is made of chrome leather with rivets in the tread. Ease of attachment and detachability are points of commendation.

Lamps of varied design constitute the main portion of the exhibits of the TWENTIETH CENTURY MANUFACTURING COMPANY, which has also a strong motor-car jack easily raised and lowered. Lamps for cars, cycles, and boats are on view, forming a useful selection for the motorist intent on securing powerful lights on reasonable terms.

Messrs. J. BARTLETT AND COMPANY have a new type of radiator which secures a maximum of cooling surface in the minimum of space. The hot water from the engine enters at the top and circulates through a series of tubes which are arranged tier upon tier, four being in each series. It then discharges into the reservoir at the bottom of the radiator. A small vent tube is provided to prevent excessive pressure of steam, and the special design of the gills secures a thorough distribution of air between the tubes to cool the water. Messrs. Bartlett and Company have also a large collection of lamps, including the "Bartlite" headlight, in which the light can be turned out without the acetylene gas escaping back through the water. The latter is completely cut off from the carbide. An ingenious arrangement is provided by means of which the headlight can be lighted from the driver's seat and also turned low when required.

The WOLSELEY TOOL AND MOTOR-CAR COMPANY, LIMITED, have no less than four large stands, devoted respectively to pleasure cars, commercial vehicles, motor-boats, and machine tools. On the first-named is shown a range of cars extending from the popular little 6-h.p. two-seater to a 16-h.p. side entrance double phaeton. The 12-h.p. double landaulet which made its debut at the Paris *Salon* is being shown in England for the first time. It has been introduced to meet the demand for covered vehicles, and, while following the usual general arrangement of Wolseley cars as regards the engine and transmission, a number of changes have

Digitized by Google

had to be made to accommodate the new form of body. Thus the engine—a two-cylinder horizontal one—is below the driver's seat, the sides of the latter accommodating the radiator, which is thus in two parts. A light shaft extends across and above the frame just under the seat; it is driven by a belt off the engine, and carries at each end a fan to induce a current of air through the radiators. The steering is of the

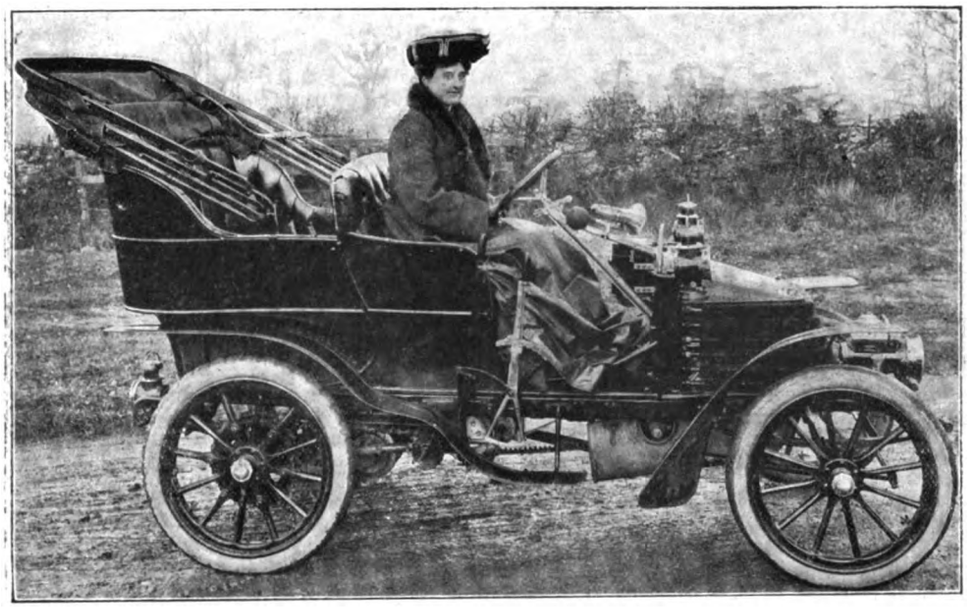

Fig. 11.—The Wolseley 8-h.p. Car.

Panhard type, while we notice that the usual dumb irons at the rear have been replaced by springs. The vehicle, which is luxuriously upholstered, can accommodate six persons including the driver, and is altogether an excellent example of modern automobiles for town work. Probably on the present occasion interest is chiefly centred on the new 8-h.p. Wolseley car. The motor is of the two-cylinder horizontal type, 4 in. bore by 4½ in. stroke and developing about 9-b.h.p. at 900 revolutions per minute. The crank shaft now runs in two bearings, one on each side. The connecting rods work on to one crank, so that there is an impulse every revolution, a heavy balance weight being provided on the shaft. The new arrangement brings the cylinders closer together and secures more equal wear on the crank-shaft bearings. The carburettor is gravity fed, and is a compensated one in which the quality of the mixture is maintained during throttling by a special form of throttle which restricts the intake of air to the jet chamber at the same time that it varies the quantity and in the same proportion. The drive is by Renold silent chain to the gear-box, which is in one with the casing to the differential on the countershaft, whence the power is conveyed to the road wheels by side chains. Four forward speeds and a reverse are provided, all being operated by one lever, which is fitted with a neat form of self-locking pawl, enabling the driver to effect the desired change in either direction without fear of overrunning the proper position. The gear-box, like the engine, is suspended at three points, and the shafts of the same run on ball bearings. Two hand-applied brakes act on the outside of drums on the rear wheels, and a pedal-actuated metal-to-metal brake operates on the inside of the same drum. The car has a wheel base of 6 ft. 11 in. and a track of 4 ft. 1 in. The exhibits of the commercial vehicle stand include a 6-h.p. car fitted with a parcels chest at the rear, and an 8-h.p. delivery van. Fig. 10 illustrates the latest production of the Wolseley Company—a 20-h.p. two-ton lorry built for the Great Western Railway Company. The main Wolseley features have not been departed from, and, speaking broadly, the vehicle may be described as a Wolseley car, enlarged and strengthened throughout to make it suitable for the work it will be called on to perform. The platform available for carrying goods has an area of fifty square feet, the maximum load being three tons. The wheel base of the vehicle is 10 ft. 6 in., track 6 ft. 2 in., and the total length 18 ft., and the tare weight, approximately, 50 cwts. The length of platform is 11 ft. 6 in., the rear overhang 5 ft., and height of frame from ground 31 in. The front wheels are 34 in. in diameter with solid rubber tyres, and the back 42 in. with steel tyres. The motor comprises two cylinders, 6 in. bore by 7 in. stroke, and develops 20-b.h.p. at 600 revolutions per minute. Half-compression cams for easy starting are provided. A Renold silent chain connects the engine shaft to the gear-box. Four speeds and a reverse are provided, the power being transmitted to the rear road wheels from the gear-box by side roller chains. Three independent brakes, all metal-to-metal, equalised in both directions, are fitted. The pedal brake operates a water-cooled drum on the side shaft of the change-speed gear. A side lever actuate two brakes, the drums of which are cast on to the sprockets of the countershaft. The third pedal controls a brake working on drums on the back wheels. The rear axle is of weldless steel tube, and the front axle is forged in one piece. The engine is located under the driver's seat, the radiator and air-cooling fans being arranged in two halves at the sides on lines similar to those adopted in the landaulet already referred to. The wagon on view, which is fitted with a canvas tilt, brought up a full load of goods from Birmingham to London one day last week at an average speed of eight miles an hour. A twenty-two seated single deck omnibus, built for the G.W.R. Co., is also on view. This is fitted with a 20-h.p. two-cylinder engine, or can be provided with a 24-h.p. motor with four cylinders 4½ in. diameter by 5 in. stroke. In other respects the *chassis* of the 'bus is similar to that of the lorry.

The "Compound" foot pump for the rapid inflation of pneumatic tyres is on Messrs. Hedley S. Hunt and Co.'s stand. This is really a high pressure pump working on the up as well as the down stroke and automatically compressing the air before forcing it into the tyre. A two-gong foot bell and specimens of "Beltine"—a preparation for slipping clutches, belts and brake bands—are also on view.

Messrs. S. Stevenson and Company come from Glasgow with a fine show of wheels for light and heavy vehicles as well as of bent timber for motor-car work. They have some artillery double-mitred staggered spoked wheels of special design and artillery wheels for thickened edged or flange fixing tyres. Good types of omnibus wheels fitted with rims for solid rubber tyres are shown, as well as those for wagons with weldless steel tyres. The firm also show steering wheels in aluminium and gun-metal covered with walnut and mahogany and presenting a most effective appearance. Wings, tonneau and other body parts are included in the large display of bent timber.

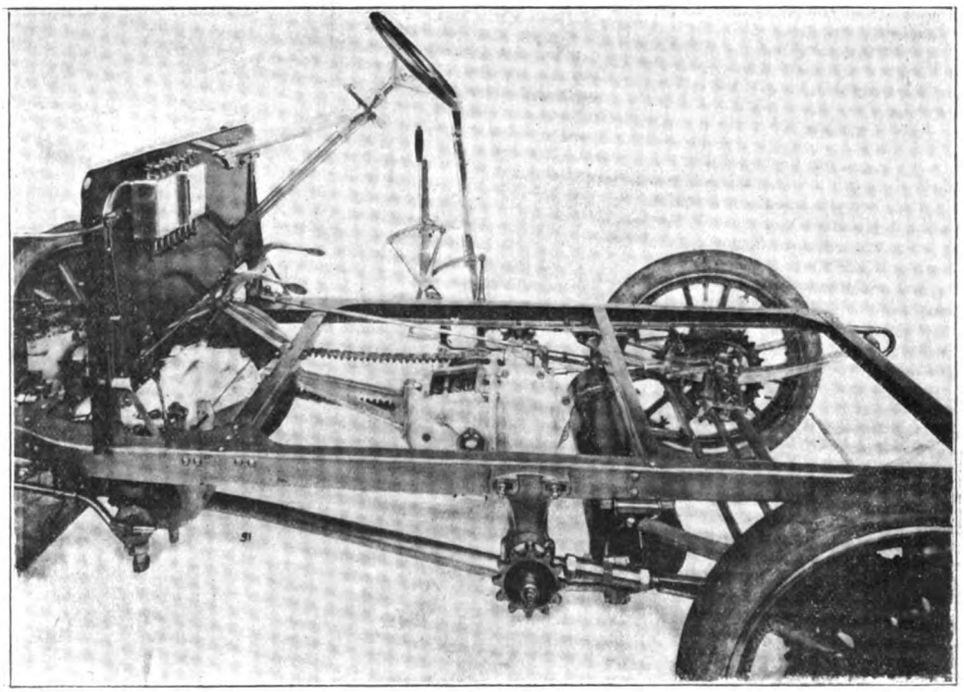

Fig. 12.—View of Chassis of Wolseley 8-h.p. Car.

The novelty of the exhibit of the ELECTROMOBILE COMPANY, LIMITED, is an electrical ambulance, Fig. 14, introduced to meet the demand for a suitable means of removing street accidents. The body which is mounted upon one of the company's normal *chassis*, is fitted with two full length stretchers, which slide into the van from behind, one above the other. A wide passage for the attendant runs down the right-hand side of the van. The carriage is lighted and warmed by electricity, and is completely fitted with

Fig. 13.—The Electromobile Co.'s Petrol Laudaulet.

all necessary appliances for first aid. The driver's seat is covered as a protection from weather, and telephone communication is provided between the driver and the attendant. A distance of twenty-five miles can be covered on a single charge of the battery, and an exhausted battery can be exchanged for a fully charged one in two minutes. The road wheels are shod with De Nevers grooved solid rubber tyres. Several of the Electromobile Company's well-known electric landaulets and broughams are on view, these being finished with the highest class of carriage work. A *chassis* is also shown so that visitors may inspect the system. An examination of this shows that several important improvements have been introduced. The front wheels have been set forward six inches, giving a slightly longer wheel-base, and the rigid front spring hangers have been replaced by half-springs. The rear suspension has also been improved by the addition of a transverse spring which supports the weight of the body, and to which the side springs are attached in the usual manner. A new form of magnetic cut-out for current breaker has been introduced. In practice this has been found to be very efficacious, eliminating all trouble from burnt contacts. The *chassis* is fitted with a safety device, which renders it impossible for the running plug to be inserted in its socket except when the controller is on the zero or neutral position. The socket has been removed to a conspicuous position in the front of the car, so that a casual glance will show whether the plug is in position or not. A new departure by the ELECTROMOBILE COMPANY is the introduction of a petrol double laudaulet for country and suburban use. This has been specially built for the company by Messrs. S. F. Edge, Limited, and is fitted with a 15-h.p. Napier four-cylinder engine of the latest type. The *chassis* is practically identical in dimensions with those used in connection with the electric carriages, the engine being located under the driver's seat which is hinged so that it may be tilted up to give access to the motor. The transmission is by side chains; the rear axle is of special design, and cannot be well described without a drawing; it may be stated, however, that the rear chain wheels and brake drums are not located in the usual position, that is to say, between the road wheels and the springs, the latter in the new arrangement being between the wheels and the sprockets. We give an illustration of the vehicle in Fig. 13, from which it will be seen that the whole of the *chassis* is used for the benefit of the driver and occupants. The result is that with a carriage having a wheel base only of 7 ft. 6 in., six people can be comfortably accommodated. It consequently turns in a short space and is generally convenient for town work; while, if the owner wishes, it can also be used as a country carriage.

Heavy vehicles for commercial and public service work form the striking feature of the exhibit of Messrs. MILNES-DAIMLER, LIMITED. Three of the 'buses bear the name Great Western Railway, and represent further additions to the fleet of vehicles which the G.W.R. are now running in districts not served by railways. Two are double-deckers, accommodating thirty-four persons, intended for service respectively between Wrexham and Fardon and Stonebridge and Belbroughton, and the other has accommodation for twenty inside passengers. Both are fitted with 20-h.p. four-cylinder motors, the power being transmitted through a clutch and gear-box on to a cross shaft at the rear. On the ends of the latter are pinions engaging with internally toothed rings bolted to the rear road wheels. A feature of the vehicles is the provision of wood wheels, the rear pair of which are shod with twin solid rubber tyres. Other improvements consist of providing the gear-box shafts with ball bearings and the control of the change-speed gear entirely by one lever. In the delivery vehicle section is shown a 25-h.p. lorry to carry five tons. The vehicle, as regards transmission, is on the same lines as the 'buses.

The SUNBEAM MOTOR CAR COMPANY, LIMITED, which for the 1905 season are confining their attention to a 12-h.p. four-cylinder vehicle, are making a side-entrance double phaeton the standard model, the *chassis* having been lengthened to a wheel base of 7 ft. 10 in. to allow of this. As for the details of the engine and mechanism, the most noticeable change is the adoption of mechanically-actuated inlet valves and a variable lift device. The latter is obtained by tapered cams on a shaft which can be slid in or out as desired. The oil bath cases in which the side-chains run, and which form one of the peculiar features of Sunbeam cars, have been improved by the provision of an inspection plate which can be easily opened for examining the chains. Five complete cars are displayed, a noticeable one being that painted in crimson, with fine black lines. The Sunbeam Co. build not only the *chassis* but their own bodies, and an inspection of the vehicles on view will show that the finish is of a very high order.

FIAT MOTORS, LIMITED, exhibit a *chassis* of their 1905 24-h.p. car, which, while comprising no startling departure, embodies a number of detail improvements, more especially as regards the clutch, carburettor and the brakes. The pressed steel frame is now narrowed in front to allow of a larger lock to the front wheels, and the wheel base has been lengthened. The four-cylinder engine has all its valves mechanically operated. The ignition, which is by low-tension magneto with pure nickel make and break tappets, is arranged to be automatically advanced or retarded in accordance with the speed of the engine. Both hand and foot accelerator levers are provided. In the new carburettor the diameter of the opening in the nozzle of the petrol jet is variable by means of a lever on the dashboard. The clutch is of an entirely new design, it being of the disc type, with springs interposed between the discs. The change speed gear wheels are of smaller diameter than hitherto, the sprockets being correspondingly larger. The rear wheel brakes are of the internally-expanding variety; water-cooled band brakes are provided on the differential shaft and also on the forward end of the side shaft in the gear box, the latter being automatically applied when the differential brake is full on. For the 1905 season three sizes are being made—16-h.p., 24-h.p., and 60-h.p.—all with four-cylinder engines. Of the former, a handsome laudaulet is exhibited, while of the 24-h.p. type, the cars on view include a limousine, a side-entrance phaeton, and a laudaulet.

Sawyer's non-skid and puncture proof band is the feature of Messrs. SAWYER AND COMPANY'S display. The band is of chrome leather distinguished by its softness to the touch as well as by toughness, the combination preventing the loss of resiliency associated with leather of inferior

Fig. 14.—The Electromobile Ambulance.

quality. Steel studs are inserted on the top tread band, and an intermediate leather band, between this and the rubber cover, successfully protects the latter from any injury which might otherwise occur through contact with the rivets. The whole is vulcanised on to an old or new cover in such a way as to cover the whole surface of the tyre, effectually preventing any possibility of side-slips or punctures. A vulcanising fluid is also shown by Messrs. Sawyer and Company, who are also placing upon the market a good type of gaiter.

The GOBRON-BRILLIE cars are now being handled in this country by a new agency under the style of Gobron-Brillié which has just been established at 106, New Bond Street, London, W. For the 1905 season two sizes of cars, viz., 25 and 35-h.p., are being built, the exhibit comprising a *chassis* and a couple of limousines of the large type. In both the frame is of pressed steel construction with a shield extending from the forward end well to the rear, to protect the engine and clutch from mud and dirt. The familiar Gobron-Brillié motor, which has two pistons in each of the four cylinders, is retained, the explosions taking place in a central combustion chamber. The valves are all mechanically operated and interchangeable, the inlets being on the opposite side to the exhaust. Both accumulator and high-tension magneto ignition are employed, these being so arranged that either may be brought into use by means of a switch. The pump, magneto, and carburettor are all mounted directly on the engine. The water circulation is maintained by a gear-driven pump, and a ribbed radiator set in a frame forming the water tank. A new automatic carburettor described in the *Journal* on December 10th last forms one of the features of the new cars. The clutch is also of new design, being practically in duplicate, there being two cones. The smaller one, which is metal-to-metal, engages first, followed by the engagement of the large one, the cone of which is leather-faced. Both clutches are controlled by the same pedal; the advantage of the arrangement is that the engine is put into gear without shock, while, to further reduce any strain on the gear-box, a universal joint is introduced between the latter and the clutch. Four speeds forward and a reverse are provided, with a direct drive to the countershaft on top speed.

The DARRACQ COMPANY has a large stand, on which a range of Darracq cars is exhibited. As a description of the 1905 models has already been given in the *Journal*, no lengthy mention is necessary at the present time. It will suffice, therefore, to briefly state that for this year this concern is making seven types of cars: 8-h.p. single cylinder; 12-h.p. double-cylinder; and 15-h.p., 18-20-h.p., 20-22-h.p., 28-h.p., and 30-h.p. four-cylinder. The chief object of interest is the new model 8-h.p. car. The one on view is fitted as a four-seated car, with tonneau body, but it is also supplied as a two-seater. The vehicle has a pressed steel frame, in the forward part of which is set an 8-h.p. single-cylinder engine. The inlet valve is mechanically operated, and is provided with a device in conjunction with the governor whereby its lift, and consequently the speed of the engine, can be regulated. The change speed gear-box is adapted to give three forward speeds and a reverse controlled by, as usual in Darracq practice, a lever on the steering column. On the top speed the drive is direct through the cardan shaft and bevel gear to the live axle. The brakes are of the metal-to-metal expanding type. The exhibit also includes a 30-h.p. four-cylinder tonneau, and examples of the 12-h.p. and 15-h.p. cars, among the latter being a handsome landaulet. The vehicles are on similar lines to the 1904 models, but comprise a number of changes in detail. Among these are the adoption of forged steel axles of H section; the steering column is now sloped considerably more, and magneto ignition can be fitted at the option of the purchaser, either alone or as a secondary ignition. The brakes are of the latest design, being internal expanding, metal-to-metal, and holding equally backwards and forwards. A new type of governor has been adopted, working on an eccentric controlled by hand and foot.

Messrs. CLEMENT-TALBOT, LIMITED, have a large stand, on which are shown a number of their cars ranging in power from 8-9-h.p. to 35-50-h.p. Principal interest is centred on the *chassis* of the latest type of 12-16-h.p. four-cylinder car. The engine has separate cylinders with the valves arranged on either side. Other new departures in the car are the placing of the steering bar behind the front axle, a new compensating device for the rear brakes, and the raising of the frame at the rear end. Messrs. T. J. HARMAN AND COMPANY, the British agents for the Vinot-Deguingand cars, exhibit a highly-finished *chassis* of the 20-h.p. four-cylinder car. Mechanically-operated inlet valves, on the opposite side to the exhaust, are adopted. The frames are of wood and steel or of pressed steel construction. The change-speed gear is of the *train balladeur* type, the sliding sleeves, however, working on a hexagon shaft in place of the usual square type. The change-speed lever is on novel lines. By pressing a spring it operates at three different heights; in the highest position it gives two forward speeds, in the middle two more, whilst in the lowest it puts in the reverse gear. The transmission is by side chains from the differential shaft to the rear road wheels. The 20-h.p. car is provided with both accumulator and chain-driven high tension magneto ignition, both being controlled by one switch and a single advance lever.

Interest at the stand of the LONDON and PARISIAN MOTOR COMPANY, LIMITED, is principally centred on the *chassis* of the 1905 Hotchkiss 17-25-h.p. car, the new features of which have already been dealt with in our reports of the Paris and Crystal Palace shows. A new speed indicator known as the "Cowey," made by the Cowey Engineering Company, Limited, is also to be seen. The indicator is on a new principle, and may be simply described as being mainly composed of three fundamental parts, viz.:—a heavy balance wheel, a spring, and a propelling device. The spring is connected up to the balance wheel in such a manner that it tends continuously to draw it in one direction (the direction of zero on the indicator), while the propelling device gives a series of intermittent impulses to the balance wheel which tends to draw it in the opposite direction. The faster the vehicle travels the more numerous will be the impulses given to the balance wheel by the propelling device, and the spring having more work to do in overcoming the effect of thes impulses will be deflected, and allow the balance wheel to be angularly displaced to a greater or less extent. The balance wheel in its turn operates the indicating pointer and moves it into a position which represents the speed at which the vehicle is travelling. By the adoption of this principle the indicator is enabled to do its work effectively under the worst conditions of vibration and is also unaffected by any frictional differences in the adjustment of its various parts. The indicating pointer is in consequence quite steady at all points of its dial, from 5 to 60 miles per hour as the case may be, and is entirely free from any quivering or shaking, no matter what speed the car is travelling at or how great is the vibration. Special care has been devoted to the method of connection, which is attached to one of the front wheels of the car. The connection is composed of solid shafting and bevel gearing throughout, no flexible shafting being used. In order to provide for the "locking" of the wheels one telescopic and two universal joints are employed which allow of the full angle of movement. An odometer is fitted to the indicator which shows the total mileage run. Perhaps the most noteworthy feature of the apparatus is the recording device, which gives an absolute record of the various rates of speed at which the car has been travelling at every point during the whole of the preceding quarter of a mile. This is accomplished by means of a series of small pointers arranged on a circular dial mounted on the face of the indicator. Part of the dial only is exposed to view, and immediately before each pointer appears it is automatically set to a position which indicates the speed at which the car is running. Each pointer maintains its indication for a quarter of a mile, when it disappears and is again automatically set to its new position, thus all records beyond the quarter of a mile are continually obliterated by the working of the apparatus. Should the vehicle upon which the indicator is fitted run into anyone, or meet with any similar accident, and then be stopped by a constable, the indicator will bear on its face indisputable evidence as to the exact speed at which the car was travelling at the point where the accident occurred as well as at every other point in the last quarter of a mile. At this stand is also to be seen the motor-car whistle of the Motor Patent Appliances Company, of which an illustrated notice was given in our issue of December 3rd last.

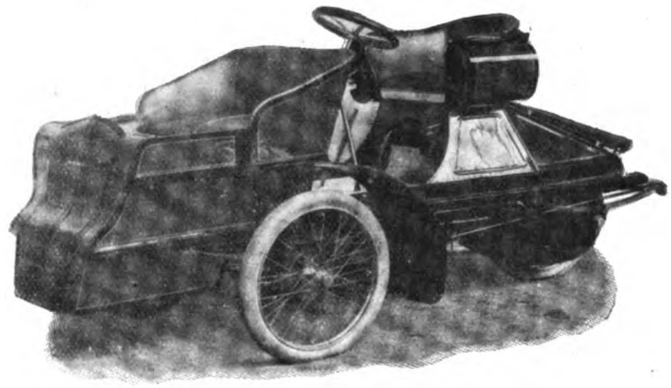

Fig. 15.—A Rexette with Special Front Seat.

The REX MOTOR MANUFACTURING COMPANY, LIMITED, display a number of the Rexette three-wheel cars, the details of which were described in our issue of the 26th November last. The machine has more the appearance of a car than a motor-cycle. A feature is the "live" tubular frame, this being suspended by long springs on the road wheels. The motive power is supplied by a 5-h.p. water-cooled engine set a little behind the centre of the frame. The water circulation is on the thermo-siphon system, no pump being used. Two speeds are provided, the engine crank case and gear-box being combined in one casting. The seats, both for driver and passenger, are of larger proportions; the petrol and lubricating oil are carried beneath the front seat. Fig. 15 depicts a Rexette, with folding dash to the front seat, which adds greatly to the passenger's comfort.

Messrs. JESSE ELLIS AND COMPANY, LIMITED, exhibit one of their standard 3-ton steam lorries. The vehicle, which is gear-driven, is fitted with one of the Ellis-Bamforth fire-tube boilers and a double-cylinder horizontal compound engine running at a speed of 400 revolutions per minute. The BRISTOL WAGON AND CARRIAGE WORKS COMPANY, LIMITED, exhibit two heavy steam wagons; one is designed to carry a load of three tons and is gear driven; the other is a new model of chain-driven vehicle and is intended for loads up to five tons. In general arrangement the wagons follow the now-accepted standard lines, the boiler being of the fire-tube type and the engine a horizontal double-cylinder compound.

A stand which seems to have a magnetic attraction for visitors is that of the BROTHERHOOD CROCKER MOTORS, LIMITED, where the new Brotherhood car, which we are at present thoroughly describing in the *Journal*, is on view. The exhibits comprise a *chassis*, a handsome double landaulet, with Mulliner body, built for Countess Amherst, a noticeable feature being the adoption of De Nevers grooved solid rubber tyres, and a side-entrance double phaeton. The body of the latter is by Hamshaw, of Leicester, and is altogether an excellent specimen of the carriage builder's art.

Digitized by Google

Messrs. J. Keele and Co. are to be found in the Annexe, where they have on view a 10-14-h.p. four-cylinder Spyker car and examples of the 9-h.p. and 15-h.p. Darracq, all of which have formerly been described in the *Journal*. Messrs. H. E. Hall and Co. have a range of the latest models of Darracq cars, ranging from 8 to 15-h.p., the new features of which have already been dealt with in our pages, and also two Clement-Talbot cars of respectively 11-h.p. and 20-h.p. Attention may also be drawn to the Bergmann Lilliput two-seated car, for which Messrs. Hall have secured the sole agency, and which, by reason of its moderate price, is likely to become very popular. The car is fitted with a 5-h.p. single-cylinder engine. The novel feature of the car is in the transmission, which is by friction drive, consisting of one power-giving and one power-transmitting disc, by means of which any desired rate of speed can be obtained, as also a reverse motion. The car can attain a speed of twenty miles per hour, and is stated to be capable of climbing gradients of 1 in 4 with two persons up.

The "Hopkinson" patent solid tyre is shown by Messrs. J. E. Hopkinson and Company, Limited, who are sharing in the motor-bus boom and supplying their special tyre to many of the 'buses put on the road by the railway companies as well as by private concerns. The idea underlying the construction of this tyre has been to secure a combination of resiliency, durability and reliability. Resiliency is attained by the absolute security of fixing, allowing a very high grade soft rubber of such a section to be used that the free rubber outside can readily be displaced under shocks so that the concussion can run itself out circumferentially round an endless tyre without hindrance. The rubber tyre is moulded in an endless form so that the base of the rubber, when the side flange plates are bolted together, is laterally compressed into the recessed steel band as shown in the sectional view in Fig. 16. It will at once be seen that any chance of creeping is thus obviated, and that the tyre when once fixed is absolutely secure. The "Twintop" form of tread also adds enormously to the natural resiliency in taking off all first shocks before passing to the body of the tyre, the easy outside displacement of the rubber naturally reducing the friction between the road and tyre, thereby increasing the length of life so that a maximum mileage can be attained. The flange plates are of cast aluminium and the india-rubber, as we have already said, is of high grade. The principle of construction of the

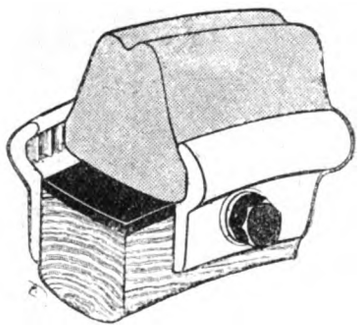

Fig. 16.—Sectional View of "Hopkinson" Tyre.

Hopkinson solid tyre is a sound one, and every care is taken in the manufacture to add to the durability.

Messrs. Renault Freres, Limited, display a range of the well-known Renault cars—a *chassis*, and a handsome side-entrance double phaeton of the 10-14-h.p. type, a 14-20-h p. coupé limousine, a 20-30-h.p. *chassis*, and a 20-30-h.p. side-entrance double phaeton. The new features of these vehicles were illustrated and described in our report of the Paris Show, so it will suffice to mention that the two-cylinder engine on the 10-14-h.p. car has mechanically-operated valves and high-tension magneto ignition. The rim of the flywheel is provided with vanes to act as a fan. The radiator is set in a frame, comprising top and bottom water tanks, the whole being mounted on the front of the dashboard. By the action of the fan-shaped flywheel a very powerful suction is caused underneath the bonnet, and thus a strong current of cold air is drawn through the radiator. The engines of the 14-20-h.p. and the 20-30-h.p. cars are similar to the 10-14-h.p., except that they comprise four cylinders. It may be mentioned, however, that the 20-30-h.p. engine is fitted with a compression release to facilitate starting. The inlet valves are provided with the variable lift device Messrs. Renault have used so successfully for several years. In the larger engines an automatic governor is provided, this acting on a butterfly valve on the admission pipe; a pedal accelerator is also fitted. The ignition is so arranged that it is automatically advanced or retarded, the hand lever usually fitted being now abandoned. A new form of automatic carburettor is also employed, enabling the air lever to be also dispensed with. The clutch is of the leather-faced cone type arranged to give a gradual engagement. The change-speed gear has been slightly modified; it is adapted to give three speeds forward and a reverse with direct drive on top speed. The cardan shaft and live axle system of transmission is still retained, but a new form of spherical universal joint is being used. The brakes are of the metal-to-metal expanding type. A shield extending well to the rear protects the under side of the engine, clutch, and gear box from mud. A noticeable departure is the adoption of pressed steel frames and the suppression of the subsidiary frame for the support of the engine and gear box. The springs are of good length, and we notice that an additional transverse spring is now provided at the rear in the case of the larger cars.

The British Automobile Commercial Syndicate, Limited, exhibit *chassis* of the 15-20-h.p. and 20-28-h.p. four-cylinder Spyker cars, the features of which were referred to at length in the *Journal* of the 4th inst., both Mr. Wellington and Mr. House being present to explain their merits.

Messrs. Peto and Radford have their usual interesting display of electrical apparatus for use in connection with the electric ignition and the electric lighting on automobiles. Their practical experience as

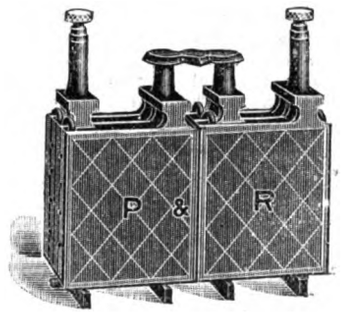

Fig. 17.—The Ashtead Accumulator.

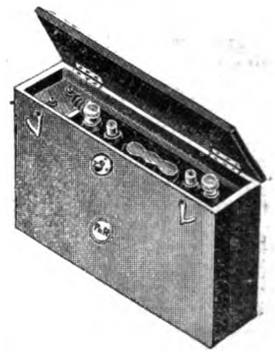

Fig. 18.—Auxiliary Accumulator. Set for Use with Low Tension Magneto.

electricians gives them a strong position from which to cater for the requirements of motorists. An interesting exhibit is that of Dr. Auer's "Osmi" lamp, fitted with a new filament, securing an illumination hitherto unobtainable from a lamp of such low voltage. Among the accumulators on view is the "Ashtead," a view of which is given herewith in Fig. 17. In this the lead support is in the form of an envelope, and the active material is in one piece, not sub-divided in any way. The containing cells are of ebonite, which are fitted into a wooden case, the whole being sealed in very carefully. Strong lead connecting bars and large terminals are provided, and although the type illustrated is one specially suitable for motor-boats, Messrs. Peto and Radford have many others designed for use on cars. In their new catalogue just issued, the firm give most complete specifications of their accumulators, adding materially to the ease with which the wants of motorists can be readily realised. Mention may also be made of the P. and R. auxiliary accumulator sets, for use with low tension magnetos. This storage battery and coil is supplied fitted as in Fig. 18, and with six volts will be found very satisfactory in use. A special size is also being made for motor-omnibuses. Other exhibits on this stand include accumulators filled with the Peto-Cadett electrolyte, the "Compound" sparking plug, the "Perfect" terminal clip with insulator voltmeters, testing and inspection lamps, a neat lamp for use inside broughams, etc., an electric rear lamp, and accumulator repair outfits.

Messrs. Hans Renold, Limited, have an effective display of samples of their roller chains, in French and English sizes, for all types of cars. They also show the well-known silent chain so largely adopted on the Mo-Car and Wolseley cars, as well as a new type of silent chain, designed with the object of increasing the wearing qualities. Elsewhere in the gallery will be found the Coventry Chain Company, Limited, with their chains made in various pitches up to two and seven-eighths inch, as well as larger chains for wagons and lorries. Messrs. Brampton Brothers, Limited, also have a display of motor lorry chains, as well as chains for lighter automobiles.

The "De Nevers" patent grooved solid tyres in all sizes, from those for light cars to the types for motor lorries and buses are shown by Messrs. J. Liversidge and Son, Limited. This tyre has come well to the front and is highly regarded by many expert motorists.

The Collier Tyre Company, Limited, have a bold display and call attention to the many special features in connection with their tyres. The security and safety of attachment of the Collier tyre is notable, for should anything penetrate the tyre and thus cause it to become deflated, there is absolutely no danger to the occupants of the car, by virtue of the fact that the tyre cannot possibly leave the wheel rim while the car is still in motion. The tyre is constructed with an extra thickness of rubber upon the tread, not only to increase its life but to afford certain protection against internal damage so commonly caused by metal, sharp flints, &c., always to be encountered on almost any road. The Collier tyres fitted to the King's 28-36-h.p. car in April of last year have from that time to the present never been touched except for inflation on one or two occasions. A similar satisfactory performance is recorded of the Collier tyres as fitted to the car of the Prince of Wales. The display on the present occasion includes outer covers of all sizes from 26 in. to 40 in. in diameter.

Aluminium castings are shown in great variety by Messrs. Williams Mills Limited. These are from alloys of great strength and are remarkable for their clean cut appearance.

STEEL AS APPLIED TO MOTOR-CAR CONSTRUCTION.

By J. S. Critchley, M.I.Mech.E.

The importance of the study of suitable materials for the construction of motor-cars cannot be too thoroughly considered, as, in fact, the motor-car of to-day only exists in its present form by reason of the advances that have been made during recent years in the art of metallurgy. In spite of all that has been accomplished, much remains to be done and explained, and in the opinion of the writer it is evident that great developments are in progress, which will yield results of the utmost importance to the growing industry connected with the motor-car. Perhaps no industry in the world calls for closer or more direct intercourse between the metallurgist and the constructor, and it is only by the most perfect co-operation between them that the best results can be obtained. The metallurgist must fully understand all the requirements of the motorist, and must give the full benefit of his experience. The motor-car is yet in its infancy, but it is evident that steel makers in this country, and more especially abroad, are beginning to take up the manufacture of suitable steels in a very serious manner. I have been very interested in watching the development of the manufacture of motor steels during the past eight years, and while one has seen great continental firms paying a vast amount of attention to their production, one has seen little or no enthusiasm displayed in this country. The continental steel manufacturer is in evidence at the motor exhibitions, and is all the time improving his productions and assisting in no small degree the motor-car manufacturer. There is no doubt that this country produces the finest steels the world has ever seen for certain purposes, and there is no reason that for motor-car work the steels produced should not be equally as good and command a sale in foreign countries, just as many of our high-class tool steels do. However, as far as we can see at the present time, we are not only importing motor-cars, but importing materials to build them with. This is a state of things which should not be allowed, and I trust that we shall very soon see our own steel firms making and supplying a large quantity of steel for the world's motor trade.

It has been said that the motor-car, as it exists to-day, has not been designed by an engineer; further, that, if it had been, it would never have existed in its present form. There is perhaps some truth in this statement, and for this reason the part of the metallurgist is an all-important one, namely, to supply the requisite materials. The sliding tooth-gear is an appalling thing to any engineer, and it only lives by reason of the materials which are used in its construction. When one considers that 90 or more horse-power can be put into a vehicle with a total weight of under one ton, and capable of attaining a speed of over 90 miles an hour, one at once understands that it can only be done by the use of materials which, for ordinary engineering practice, would never be even suggested. Steel includes a material as soft and pliable as any wrought iron, and as hard as flint, a material with the elasticity of a Damascus blade, or as brittle as glass, a material with 25 per cent. more ductibility than the best iron, or of 100 tons tensile strength to the square inch, and with no perceptible elongation, a material that will weld nearly as well as the best wrought iron, or a material differing from chilled cast iron only in its malleability, a material varying from almost nothing upwards in any of all these properties. The varying qualties of steel are practically due to the percentages of carbon and iron contained in the material. Iron may contain anything from ·06 to 4½ per cent. of carbon, and in addition it may be alloyed with nickel, chromium, vanadium, all of which when alloyed in suitable proportions impart to steel a hardening effect, combined with toughness, and it is by the judicious alloying of one of these metals and carbon whereby steels of great strength and toughness are produced.

Steels containing over 0·5 per cent. of carbon are termed hard steels or high carbon steels, and those containing less than 0·5 per cent. are known as mild, soft, or low carbon steels. The uses and employment of different kinds of steel depends upon the percentage of carbon, the high carbon steels being almost exclusively used for the making of dies and cutting tools. For structural purposes, steels with more than ·45 per cent. of carbon are seldom used, as the higher the percentage the greater the risk. Steel with anything above a small percentage of phosphorus, say 0·4 per cent., is not suitable for any purpose where it is subjected to shock or vibration. Sulphur also has a detrimental effect, and should only be present in about the same proportion as phosphorus, *i.e.*, 0·04 per cent. Nickel, chromium and vanadium have a marked effect on steel, increasing both the ultimate stress and elastic limit, and it is in connection with alloys with these metals that some remarkable results have recently been obtained.

There are a number of tests to which steel may be put in order to determine its suitability for any particular purpose. I am of opinion that for motor-car work, or for any structures subject to alternating loads and severe and sudden stresses, the ordinary static tests should be supplemented by dynamic tests. Unfortunately, this description of test is not yet properly standardised, but many steelmakers and users of steel carry on these tests in their own particular method. These tests usually consist of impact tests on flat bars, and impact or notched bars. The impact or shock test on flat bars consists in dropping a weight on to a bar which is supported at each end and noting the deflection after a certain number of blows. The same test is also carried out on notched bars, which is a better guarantee as regards toughness. It has been proved that steel which shows a good resistance to impact always has a good elastic limit and elongation, but steels which show good static tests are often quite useless to resist shock. It further appears that oil-tempered steels show much greater resistance to impact; in fact to a much greater degree than would be supposed from the slight gain in the static tests, thus showing that the oil tempering has imparted to the steel a quality that is not adequately recorded by the improvements that may be shown in those tests.

All tests may be said to be merely indications—generally very good indications, but when steel is to be applied for a new and particular purpose—for instance, the gears of a motor-car—there is a great deal to be learned from actual use. Probably the first gear wheels which were made for motor-cars were made from cast metal, with the teeth cast in, and the next stage would probably be wheels of mild or cast steel with machine-cut gears, probably very good material for certain purposes, but totally unsuited for the rough usage of sliding gears. The next stage in the evolution of gears was doubtless the case-hardening, with all the difficulties and troubles of overheating, warping, improper quenching, etc. The improved methods of dealing with this material in order to obtain a very hard outer surface, which would not chip, and a soft and ductile interior, are the next stage. We then come to the use of nickel steels, and nickel chrome steels. Many of these steels do not require case-hardening at all, while others are made of a special quality which case-harden very well. The great art in case-hardening gear wheels is to prevent distortion on quenching. This can only be accomplished by a man who has had a lot of experience in the work. The temperature of quenching is also a very important one, as if quenched at too high a temperature the surface of the metal is very brittle. Some nickel chrome steels do not require case hardening, are oil tempered, and the material is in itself tremendously hard, in fact so hard that special tool steel has to be obtained in order to shape the gears. I well remember the first nickel chrome steels which I applied to gear wheels in the year 1900. I submitted a sample of the steel to some tool makers who were at the time supplying a special machine for gear work. This material quite upset all their preconceived ideas as to the cost of production; the cost of cutting these wheels was quite double the cost of cutting ordinary mild steel. But so satisfactory were they that many of them are to-day practically as good as when they were put in.

A new steel for gears which has just been put on the market is a French invention, the sole rights for France having been taken up by one of the largest builders of motor-cars in Paris. This steel is carburised in the usual way by heating in boxes with the usual case-hardening substances, the time required being about seven hours, at the usual temperature of about 1,470 deg. Fah. The parts are, however, not quenched, but allowed to cool gently, when they become quite hard. As it is not necessary to quench in water the parts are not distorted. However, the most remarkable characteristic of this steel is that as it is subjected to strain and friction the harder and tougher it becomes. The physical tests of this steel are as follows:—Tensile strength, 33·4 tons per square inch; elastic limit, 24·8 tons per square inch; elongation in 2 in., 31 per cent.; and contraction of area, 69·5 per cent. Messrs. Shipman, of Sheffield, well-known steel manufacturers, have taken up this steel in this country. In all cases where case-hardened steel is used tests of the material should be made, both before and after case-hardening. The carbon content should be a low one, otherwise the steel may become brittle on being quenched, the essential point in case-hardening being to harden the surface only, while leaving the metal under the hard skin soft and ductile. Messrs. Fairley and Sons, of Birmingham, to whom I introduced the nickel chrome steel before referred to, have since made and supplied it. Practically it is a tool steel of high quality, containing, in addition to carbon manganese and silicon, nickel, chromium, tungsten, together with traces of cobalt molybdenum.

(*To be continued*).

* Abstract of Paper read at a meeting of the A.C.G.B.I. on February

We learn that the new London Motor Omnibus Co. have placed an order for twenty-five Wolseley 'buses, with seating accommodation for thirty-four passengers. Some of the chief points in the design of the Wolseley 'bus are:—(1) The employment of a pressed steel frame. (2) Slow running motor, which gives a wide range of effectiveness. (3) A reasonable length of wheel-base, with the same capacity for passengers as that provided by 'buses fitted with vertical motors.

The authorities of the City of London have received an official intimation to the effect that the Local Government Board does not propose to make any alteration in the existing law as regards the speed of motor-cars in the City. It is suggested that the present speed limit of twenty miles an hour should remain unaltered for at least another year. While the speed limit of motor-cars passing through the City is twenty miles an hour, the actual pace is never on an average more than eight miles an hour.

CLUBS AND ASSOCIATIONS.

NOTTINGHAM.

Members of the above club gathered in good numbers at the Black Boy Hotel on Friday of last week to hear a lecture on "Motoring Experiences in South Africa," by Mr. A. R. Atkey, a vice-president of the organisation. Amongst those present was the president (Mr. C. Hardy). Messrs. Wells-Lucas, S. Harvey, A. Watts, F. Pearson, J. C. Bennett, R. Harbidge, H. Bircumshaw, H. Kirk, Dr. Gass, E. A. Stevens, C. L. Stevens, H. V. Stevens, W. M. Hutchinson, A. Metheringham, B. Winter, G. Cowen, M. Ross-Browne, W. B. Wells, and Booth Granger, hon. sec.

Mr. Atkey said that during his various visits to South Africa he had made motor trips through Cape Town, Bulawayo, Port Elizabeth, Ladysmith, Mafeking, and all the principal towns in Cape Colony and Rhodesia. A slide illustrative of a meeting of the Cape Town Automobile Club was thrown on the screen, and the lecturer said it used to be a rule that no man should, on a club run, pass the leader. As the roads are in some places covered with two or three inches of fine white sand the condition of the last man might be better imagined than described! Mr. Atkey said the roads were almost impassable in certain parts of the country, and he gave many original slides showing the stiff gradients, frequently averaging 1 in 6, which South African automobilists had to overcome. The difficulties of crossing the veldt and negotiating the water spruits and other natural objects encountered out there were described and illustrated. At one place they overtook Sir Hely Hutchinson, the then Governor of Cape Colony, making a tour of the different towns. Entering one place about two hours before the Governor was due, Mr. Atkey and a friend found it lavishly decorated, with the local band and all the population lining the streets. As the car ran along the two occupants were greeted with acclamation by the whole populace under the impression they were the representatives of the Government. Mr. Atkey was the first to accomplish the journey between Johannesburg and Mafeking, a distance of, roughly speaking, 200 miles, in one day. To do that he was driving a car 14 hours continuously. His was only the third car to enter the famous siege town. "We left Johannesburg," said Mr. Atkey, "twelve hours later and arrived at Mafeking 36 hours earlier than the train," which is, of course, explained by the fact that he followed a cross-country route direct to his destination, whilst the train made a detour of about 1,000 miles.

LINCOLNSHIRE.

At the annual general meeting of the Lincolnshire A.C., to be held at headquarters, the Saracen's Head, Lincolnshire, on Saturday, the 25th inst., the statement of accounts will show a profit of £22 7s. 2d. on the year, which makes the total balance in hand £52 14s. 6d. An important proposal is that for the committee two members shall be resident in each of the three county divisions, Holland, Kesteven, and Lindsey, these six being virtually district representatives.

SOUTH WALES AND MONMOUTHSHIRE.

The report and balance-sheet just issued covers only the nine months since March 31st, 1904. After considerable trouble the special sub-committee appointed to select a site or buildings for the club headquarters and motor-house were fortunate enough to secure a piece of ground in an admirable position at West Wharf, in the centre of Cardiff, at a low rent. There was a ruined cottage on the site, but this is now transformed into the headquarters, with committee, ladies', caretakers' rooms, and lavatories. In addition, an excellent motor-house with accommodation for about forty cars has been built. It is equipped with examination pits, hose, cement floor, etc. The thanks of the members are due to the sub-committee, consisting of the Chairman, hon. Secretary, Mr. J. J. Neale, Mr. J. L. Proger, and Dr. Pritchard, for their enterprise in securing such a convenient site, and in arranging for such a rapid erection of the buildings. The proposal of the Newport Borough Council to restrict the speed of motor-vehicles to ten miles per hour, in certain streets of Newport, was strenuously opposed. Although the Glamorgan County Council is far ahead of many other County Councils in widening and looking after the roads within its territory, it is backward in erecting the necessary signs provided for in the Motor-Car Act. It has been suggested that if there is to be further delay in fixing up these notices, the Council should, meanwhile, repaint the cyclists' "danger" and "caution" boards that are already erected on many dangerous hills and corners.

Another matter in which the protest of the club has been ineffective, is in respect of the first electric tram standard (after passing under the railway bridge) on entering Cardiff by the Newport road. This standard is in the middle of the road, and, being unlighted, and within the shadow of the bridge, constitutes a real danger to motorists—strangers especially. In reply to the Committee's protest, it is stated that the Council intends to light up all Newport Road with electricity at some future date. This is all very well, but, in the meantime, there may be some terrible disaster. Surely if there is any difficulty about placing an electric light on this dangerous standard, an ordinary lamp might be fixed. Perhaps Cardiff motorists will bring pressure to bear through the Councillors of their wards.

The balance-sheet shows the club to be in a thoroughly sound position. The assets amount to £329 12s. 4d., and the total liabilities (loans by members) only amount to £215. A surplus of £56 4s. 5d. is the result of the nine months' working.

THE HARTLEPOOL CLUB.

The annual general meeting of the Hartlepool Club has been held at the Grand Hotel, when a large number of automobilists were present. The balance-sheet for the past year's work was presented and showed a substantial balance in hand. In the course of the evening the Chairman dealt with the doings of the club during the year, remarking that these were very satisfactory for a new association. Two cups were presented to the Committee, one for competition among the cars, given by Mr. C. E. Smith, C.E., and the other for motor-cycles given by Mr. Harold E. Pyman. The following officers were appointed:—President, Mr. D. Jones, J.P.; Vice-Presidents, Drs. F. H. Morison and A. E. Morison and Mr. J. R. Fothergill; Committee, Messrs. A. G. Rickinson, C. E. Smith, R. Lauder, jun., C. McAdam, and Dr. Wall; hon. Treasurer, Mr. H. H. Barraclough; hon. Secretary, Mr. C. C. Brown.

The annual general meeting of the Southern Motor Club will be held at the Canterbury Hotel, Brixton, S.W., on Thursday next.

The address of the new hon. secretary of the Yorkshire Club, Mr. C. P. Wilson, is 5, Park Row, Leeds.

In our next issue we shall give a report of the annual meeting of the Gloucestershire Automobile Club.

The Yorkshire Club has celebrated the refusal of the Local Government Board to restrict the speed of motor-cars to a maximum of ten miles an hour by holding a smoking concert at their headquarters.

TYRE FITTING COMPETITION.

At the Motor Car Show at Olympia the tyre removing and refitting competition at the "Continental" tyre stand has been a popular feature. Up to Tuesday night the times of the best fifteen competitors were as follows:—

	Min.	Sec.
A. Merry, Coventry	6	41 4-5
G. Pallat, London	7	1 3-5
C. Alsop, Coventry	7	42 2-5
H. Jennings, London	8	11 3-5
A. Bond, Crayford	8	35
G. Mordon, Croydon	9	45 1-5
W. Blackmore, London	10	5 1-5
C. W. Siebert, London	10	8 2-5
R. R. Cox, Surbiton	10	9 3-5
E. Barnfather, Croydon	10	53 3-5
L. Piechawrcz, Peasmarsh	10	59
J. Green, Manchester	11	3 2-5
R. Brewer, London	12	11
C. F. Drewry, London	12	47 4-5
L. Jennings, London	13	23

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Acock's Green	Not exhibiting a red light at the rear of the car	5s., etc.
Southport	Reckless driving	Dismissed.
West London	Dangerous speed	Dismissed.
Derby	Furiously driving a car	£6.
Oakham	Excessive speed	10s. 6d.
Cheltenham	Furious driving	£2.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department, Motor-Car Journal, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, FEBRUARY 25, 1905. [No. 312.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

MR. HENRY GWINNER appeared at Bow Street Police Court on Tuesday to answer an adjourned summons charging him with driving a motor-car in the Green Park at a greater speed than ten miles an hour. At previous hearings it was contended by Mr. Staplee Firth, who appeared for the defence, that the regulations under which the proceedings were taken were *ultra vires*, and the case had been adjourned for the magistrate to consider his decision. Mr. Marsham now said that the question was an important one on which he would willingly state a case. The regulations had not been laid before the Houses of Parliament, but he held that it was not necessary they should be before becoming operative, as his view was that that was not a condition precedent to their validity. There might be some doubt whether the Commissioners had power to make regulations, but taking all things into consideration he had come to the conclusion that they had such power. In these circumstances he fined defendant 40s. and 2s. costs. Mr. Staplee Firth asked for a stay, to enable him to consider whether he would take a special case or proceed by writ of *certiorari*. This was granted.

◆ ◆ ◆

Support Wanted.

THE importance of this case and the care and energy with which Mr. Firth has followed up the point he disclosed to motorists on the occasion of Mr. Moresby White's paper at the A.C.G.B.I., has already been referred to in our columns. It is to be regretted that Mr. Marsham, who doubts the power of the Commissioners to make regulations, should, nevertheless, fine the defendant in this case, and thus clear the way for further expense and trouble. The evidence called by Mr. Firth should have settled the matter, which seems to be one of fact rather than of law. We hope motorists generally will give all the support they can to both Mr. Gwinner and Mr. Firth, who are stoutly fighting the battle "for the parks."

◆ ◆ ◆

In the House.

MR. CATHCART WASON is the illustrious Parliamentary representative of the Orkney and Shetland Islands in the House of Commons. He occasionally blossoms into prominence as the opponent of automobiles, or, perhaps, we should be more correct in saying the legislature querist who generally gives folks the impression that motor-cars are not the objects of his particular fancy. On Monday he asked a question of the Secretary of the Local Government Board practically suggesting that compensation should be paid by the Government to local authorities for damages that "might be done to roads, bridges, sewers, gas and water mains by such heavy vehicles." He also wanted the House of Commons to be given an opportunity of expressing its opinion—if it has one—on the new orders before bringing them into force. Mr. Grant Lawson, who replied on behalf of Mr. Walter Long, was able to point out that the regulations were mainly in accordance with the recommendations for a departmental committee on the subject, and rightly declared that there was not sufficient reason for the proposal that compensation should be given to local authorities. In accordance with the Statute, the Order of the Local Government Board has been laid on the table of the House. And that was all the satisfaction he could give Mr. Wason.

◆ ◆ ◆

Names in Hamlets.

SOME correspondents in the Press have lately been calling attention to the difficulty of discovering their whereabouts when arriving in some of the smaller villages and towns of the country. It is pointed out that this is particularly irritating on night trips, and that it is almost impossible on such occasions to ascertain the name of the hamlet in which the motorist or other wayfarer may find himself. The suggestion that the signposts at the entrance to such localities should bear the name conspicuously painted thereon is an admirable one, and we would take this occasion to remind motorists that the Postmaster-General requires rural post-offices to have the name of the village placed conspicuously over their doors. This is unfortunately sometimes ignored, or the wear and tear of time has obliterated the lettering. A communication to the Postmaster General, however, calling attention to omissions of this kind, will ensure a prompt remedy. Those who discover instances of local neglect will be doing useful service in bringing such matters to the notice of the authorities.

◆ ◆ ◆

Motor Car Imports and Exports.

THE New Year has brought with it no diminution in the importation of foreign motor-cars and parts into this country. No less than 362 cars were imported in January, their value being returned at £149,578, which, added to £36,608 of parts, gives an aggregate of £186,186 for last month, as compared with only £120,772 in January of last year. As regards the exports of British motor-cars, these show a slight progress. The number shipped last month was seventy-seven, of a value of £25,590. To this have to be added £7,480 of parts, giving a total of £33,070, as against only £28,636 in the first month of 1904.

◆ ◆ ◆

The Road of the Future.

BEFORE the Royal Scottish Society of Arts the Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, has been giving his views as to the future of British roads. The revival of the use of the road which was upon us in the form of nearly 80,000 motor-vehicles, the establishment of long-distance road motor-omnibuses in many cases by railway companies themselves, and the now certain fact that the great omnibus companies of London had definitely determined to abandon horse-haulage—all of which were only the harbingers of the coming great change—had once more aroused interest in the road, as a possession which might no longer be neglected, but must have earnest thought directed to its improvement. The improvement of our ways must be considered in two

Digitized by Google

aspects:—(1) Could we find modes of surfacing our roads according to the requirements of the traffic, which, if adopted, would give satisfactory results; and (2) if we could not now say that any such road had been invented, how could we best, in the meantime, improve what we had, so as to minimise the disadvantages of our present system? The lecturer proceeded to criticise such materials for road construction as wood, val de travers, stone, and macadam. His lecture should have a good effect on the road surveyors of Scotland.

◆ ◆ ◆

Throwing Stones at Motor-Cars.

THE Committee of the South Wales and Monmouthshire Automobile Club has been in communication with the chief constables of the borough and county police in respect of the great danger to motorists through stones being thrown at passing cars by boys. This practice is, unfortunately, on the increase, and has recently been the cause of seriously injuring at least two lady occupants of cars, and of causing more or less damage to several motor vehicles. One has promised that "the matter shall receive the immediate attention of the borough police," and the other suggests that when stones are thrown "the motorists be requested to at once communicate with the police, who are instructed to render them every assistance in tracing the delinquent." It is to be hoped that motorists will comply with this suggestion in future, so that an example may be made of the next culprit. The nuisance is one not confined to Wales.

◆ ◆ ◆

A Novelty in Motor-Cars.

A motorist at Salina, Kansas, who, as a result of an accident, broke the front wheels of his Oldsmobile, managed to get home under his own power in the novel way depicted in the above illustration. He commandeered an old sulky, to which he connected the front of his car in such a way that the wheels of the sulky acted as the steering wheels, while the shafts formed the steering tiller!

◆ ◆ ◆

Motor-'Buses in the Provinces.

PROVINCIAL borough councils, as well as the public 'bus companies of London, are looking to the motor-'bus to ease some of the stress of traffic in large towns. At Wolverhampton, the Tramways Committee of the Corporation have been considering the matter, and recently asked sanction to obtain tenders for the supply of three double-decked motor-'buses. Naturally some difference of opinion was raised at the meeting of the Council, but it was significant that no general opposition to the principle of the motion was heard. Some councillors spoke of the passing of the tramcar before the advance of the motor-'bus, and advised a postponement of the matter, so that a really adequate scheme could be produced. Finally, it was agreed to defer decision for a month, when the matter will be discussed. It is highly probable that this enterprising Midland town will be among the pioneers of the motor-'bus services in the provinces.

◆ ◆ ◆

In the Eastern Counties.

PUBLIC meetings in support of local motor-'bus schemes are being held in various parts of the country, and enthusiasm seems to be the order of the day. At Great Wakering (Essex) the Rev. Horace Serjeant presided over a meeting at which Mr. J. Sellar, of Southend, propounded a scheme to raise a capital of £5,000 to run a motor-'bus service between Shoeburyness and that place. The estimated weekly expenditure for two cars, drivers, petrol, oil, rent, repairs, renewals, licenses, etc., was £13, while the estimated weekly takings, reckoning the cars at only 25 per cent. of their carrying capacity, would be £18 7s. 6d. The estimated annual income of the company would therefore be £955 10s., which, after deducting £676 for the estimated expenditure, would leave a profit of £279 10s. After paying out £179 10s. to the reserve fund and for depreciation, etc., a balance of £100 would pay 10 per cent. per annum on each £1,000 of the subscribed capital. He suggested that the directors should receive no remuneration, and that no promotion money be paid until the company paid a 7 per cent. dividend. Letters which had been received from the London Motor Omnibus Company, Limited, the Birmingham Motor Express Company, Limited, and from the Hastings and St. Leonards Motor-'Bus Company, Limited, in support of the prospects of success for which the company might hope, were read. Mr. J. W. Smith, secretary to the Birmingham Motor Express Company, Limited, wrote that their 'buses ran on an average ninety miles a day, and that the net profit was 3d. per mile. This was after working expenses and management charges had been paid, and after deducting a depreciation of £20 on the cars, and charging all renewals and repairs, etc., to the revenue account. Ultimately a resolution in favour of the proposed service was carried unanimously.

◆ ◆ ◆

Warwickshire County Club.

A COUNTY club for Warwickshire has just been formed at a meeting held at Leamington under the presidency of the Vicar. The whole of the country is being covered with a network of such organisations, which can do most valuable work in influencing public opinion to incline favourably towards the automobile. In view of the fact that the present Motor-Car Act will expire in a comparatively short time, it is all the more necessary that educational work should be thoroughly and systematically developed throughout the country. We record with satisfaction the formation of this club in the central county of England, and hope that all the county people will give it their hearty support.

◆ ◆ ◆

All British.

Now that the cry of "all British" seems to be heard from the ranks of prospective motorists, it is of interest to remind readers of the exemplification it will receive at the Agricultural Hall Exhibition next month. Glancing along the plan of the Exhibition, a succession of British names strikes the eye, and it is evident that, even more than at Olympia, the national character of the display will be a notable feature. This is highly gratifying to those who have worked long and well for the success of the British branch of the automobile industry, and the reward to English and Scottish capital should not be far off. In fact, it has already come to some.

The Scottish Trial.

THE reliability run of the Western Section of the Scottish Automobile Club will begin on May 10th, when, starting from Glasgow, a run will be made *via* Edinburgh, Stirling, and Perth to Dundee, the total distance being 135⅜ miles. On the following day the trip *via* Blairgowrie and Braemar to Aberdeen will include a hill climb at Glenshee, and total 111⅜ miles. The third day's run (162½ miles) will be the longest and most interesting of the four. Concluding at Aberfeldy it will include a hill climb at Cockridge, and a visit to Tomintoul, the highest inhabited place in Great Britain. On the 13th the motorists will return to Glasgow by way of Crieff, Lochearnhead, Dalmally, Inverary, and Arrochar, thus completing an entire journey of 560⅜ miles. Special reports will be issued with regard to the tyres used in the trials. Already the organisation is well in hand, and Mr. R. J. Smith may be expected to repeat the well-ordered arrangements that characterised the annual Glasgow to London trips, now superseded by the new Reliability Trials.

Progress in New Zealand.

AT the last meeting of the Canterbury Automobile Association, which is doing much to promote automobilism in New Zealand, reference was made to the opening up of reciprocal operations with motor-car organisations in Great Britain and elsewhere. Doubtless when some definite proposals are made to our English clubs they will be favourably entertained, and anything that can promote the interchange of visits, or increase the facilities for motorists when on tour in the colonies, is to be heartily commended. The Canterbury Association has already been able to secure some improvement in the roads of the district, while the city authorities are to be approached with a view to providing a motor-car drive through one of the leading parks of the city. Apparently the association has been met with friendliness from the police and other authorities, and is on the high road to prosperity.

The Berkshire Main Roads.

SATISFACTORY is the news that from April 1st the County Council of Berkshire will take over the direct management of all the main roads in the county, and that a surveyor has been appointed to devote the whole of his time to their care. Reference to this fact is made in the annual report of the Berkshire Automobile Club, and the pleasure of the local automobilists is enhanced by the knowledge that the new surveyor is an enthusiastic motorist. That is the type of man who should be appointed to such posts—one who can appreciate the growing necessities of main road traffic, and who can realise that the efficient supervision of the highways is really a source of assistance to the people of the district.

The Fire in Long Acre.

EARLY on Wednesday morning the biggest fire that London has seen for some months broke out on the premises of the Ariel Motor Co. and Messrs. Slatter and Sons, in Long Acre. The flames rapidly spread to other buildings in the vicinity, and a large number of firms interested in automobilism were threatened. Motor-cars were quickly run out therefrom to places of safety, and a long line was soon formed in Charing Cross Road and neighbouring thoroughfares. Thirty horses were also removed from a 'bus-owner's stables in Castle Street. But many carriages were destroyed, and others in a charred condition were taken into St. Martin's Lane, where the London premises of the Star Engineering Company are situated. The adjoining place was attacked, but it fortunately did not reach the Star depot. The warehouses of the Collier Tyre Company and several other firms were saved, but several cars were destroyed, including, it is rumoured, a 70-h.p. Mercedes.

An Anecdotal Evening.

Last week's meeting at the A.C.G.B.I. was hardly a serious affair, and Mr. Mecredy's fund of humour and anecdote provided a full hour's laughter and amusement. Attracted by the name of the writer of the paper, a fairly large gathering of members took place, who delighted each other with reminiscences of early motoring. Less than a decade ago motoring provided some exercise and was as varied and changeable as the weather, and the motorist was trained in resourcefulness; nowadays, however, reliability has taken the place of uncertainty, and motoring has been divested of many of its pleasures, incidents and anecdotes. Hence, possibly, some of the delight derived from listening to Mr. Mecredy's paper, some serious conclusions from which are given on another page.

◆ ◆ ◆

Motors for the Sick.

A Scottish sportsman has presented an Albion motor-car to the Dundee Consumption Sanatorium, to be employed in conveying patients to and from Auchterhouse Station, which is some distance from the institution. Although such luxuries have been denounced as adding to the cost of maintaining institutions of the kind, experience is proving their economy, while the fact that they are engaged in ministering to the comforts of the old, sick, and infirm should

The Church of St. Liphard, Merry, France.

be appreciated by those who have any regard for the condition of less fortunate human beings. At Edmonton a motor-'bus is being used with success in Poor Law work, and the Metropolitan Asylums Board is now endeavouring to find a motor-ambulance suitable for the conveyance of sick persons to and from its various institutions.

◆ ◆ ◆

Huddersfield Humour.

The Huddersfield town councillors, or at least some of them, seem to have a very perverted view of humour. We had thought that the motor-car as a means of oratorical display at meetings of such bodies were quite past, but the Huddersfield folks seem to have delighted themselves, if not their constituents, by attempting to ridicule one of their number who lately took to automobilism. Councillor Tetlow, when the minutes of the Watch Committee were read, drew a highly-coloured picture of the "disgraceful" and "abominable" way in which motor-cars sped through the streets of the town. He had seen a vehicle travelling at a rapid pace, and had intended to call the attention of the nearest policeman to its speed, when he discovered that the only passengers besides the driver were a couple of constables. Apparently his idea is that the automobile education of the police is being provided by some of the local motorists, who, in order to convince these "limbs of the law" that motoring is quite safe, have arranged to give the police some practical acquaintance with the subject—not a bad way of preventing the police displaying ignorance when they find it necessary to haul their victims to the courts.

◆ ◆ ◆

Highway Protection Leagues.

Mr. J. H. Nunn writes from Lealands, Hellingley, Sussex, that in connection with his proposed "Anti-Speed Motor League" he has received numerous replies from all classes of society urging him to take active steps in the matter, and offering their support both practically and financially. Among the replies, however, was one from Mr. W. L. L. Bell, stating that he and some other gentlemen had started a "Highway Protection League." Mr. Nunn found that these gentlemen were working on the lines he had advocated, and therefore he has decided to work with them and give the Highway Protection League his hearty support. Funds and names are of the utmost importance, and he urges all who do not wish to see "our countryside transformed into a huge scorching track" to send in, without delay, their names and addresses, with a subscription, to Mr. W. L. L. Bell, 4, Harcourt Buildings, Temple, London, E.C., and also to state if they are willing to act on local branches. Mr. Bell, the hon. secretary, will send to anyone who writes for them the rules of the league, the scheme decided upon, and all information regarding branches and other details. Evidently other people besides motorists are hasty in their attempts to be first even in forming a league to thwart the progress of a rapid movement.

A garage, with repair shops, etc., has been opened in Phœnix Street, Derby, by Mr. E. V. Clarke.

Mr. P. G. Hawkes has been enrolled as a member of the Motor Volunteer Corps. Owing to pressure of Parliamentary duties Captain (Brevet Major) A. H. Lee, M.P., has been compelled to sever his connection with the Corps. Captain H. H. Paynter and Mr. H. N. Watson were employed under Major-General Sir Leslie Rundle, K.C.B., &c., commanding the North-Eastern District, on a staff ride in the neighbourhood of Beverley and Driffield at the end of last week.

Mr. John Stirling, who was an early pioneer of the motor-omnibus, has, we learn, taken up residence in London for the special purpose of dealing with motor-omnibuses for the metropolis. During the past three years Mr. Stirling has made a close study of the problem, and has carried out many experiments with the view of arriving at the design of omnibus best suited to meet the special conditions of London traffic, and his new company—Stirling's Power Traction Co.—is now beginning the manufacture of motor-omnibuses embodying the features he considers necessary for permanent success. Some of the points relate to the simplifying of the mechanism, and the consequent easy management, with the view of assisting in the more rapid absorption of the best class of "'busmen" as drivers. The wearing parts are being made of great strength and durability, and Mr. Stirling claims that his new "power" omnibus will be the most economical in operating costs yet produced; as proof of which the company offers to undertake a "maintenance" contract for a period of years on the basis of the mileage run. Mr. H. A. Smith is the company's works manager, and the head office, at which Mr. Stirling will be found, is Granville House, Arundel Street, Strand, W.C.

THE "BROTHERHOOD" CAR.

[*Concluded from page* 1055.]

FOUR brakes are provided, two on the differential shaft located at the side of the spockets and operated by the clutch pedal, and two on drums connected with the rear road wheels actuated by a pull-up hand lever. They are all of the contracting metal to-metal type. The band *A*, Fig. 21 and Fig. 22, is composed of two semicircular stiff steel pieces fitted with easily renewable gun-metal liners *B*, carried on two pivots, so as to exert uniform pressure on all points of contact with the circumference of the steel brake drum *F*. An extended spring scissor motion *E* is provided at the fixed pivot to assure the immediate release of the band when thrown off the drum, and preventing contact when not in use. Owing to their even contact on the circumference of the brake drum the bands can be applied either very gradually or suddenly, and, being constructed of stiff steel rings with the spring scissor motion, and suspended on two rigid points, they cannot bind on, obviating any risk of accident through the wheels being locked involuntarily, or offering any resistance by causing friction by rubbing when not in use. Further, they provide the advantage of the drums (which have no flanges) or bands being removed independently without affecting each other or any other part.

The brake drums and chain sprockets are attached to a spider, C, Fig. 21, mounted on the differential shaft, so that to change the sprockets it is only necessary to remove four bolts to each, or eight in all. The pivots of the bands of the brakes on the differential shaft are carried on studs formed on special brackets bolted to the frame, while those on the rear brakes are supported on arms attached to the axle, independently of the brake rings. While dealing with the subject of brakes we may refer to a useful provision in the shape of a small lubricator in

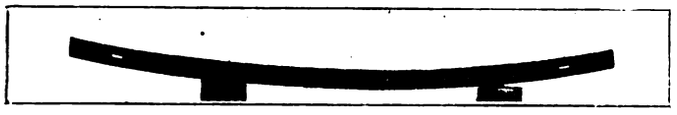

Fig. 20.—View of Plate of Spring showing Oil Groove.

the bands, through which paraffin may be squirted to clean the drums should they at any time become greasy.

The steering gear is of the worm and worm wheel type and is irreversible. The steering bar is arranged behind and slightly above the rear axle, so that should the car run into a dog or other obstruction on the road there is no danger of the steering gear being damaged, as the axle would take the first blow. The steering pivots, which are neatly arranged in a box, have a ball bearing at their lower end. The steering gear is controlled in the usual way by an inclined hand wheel, the column of which is, however, so mounted that its inclination may be varied to suit the convenience of individual motorists by loosening only three nuts. The inclined steering pillar is hollow, forming the tube connected with the horn, the bulb being screwed into the centre of the steering wheel so as to remain constantly in the most convenient position.

The springs are of good length, being 36 in. by 1½ in. at the front and 50 in. by 2 in. at the rear, the latter being outside the frame. The plates of the springs are of special construction, being tapered down by hand, while an innovation is found in the provision of an oil groove in each plate, to which oil may be fed, the trouble of squeaking and rusty springs being thus avoided. In making up springs, the usual custom for providing lubrication between the plates is carried out by introducing grease at the time of assembling, and in such a manner that, to replenish this, it is necessary to take the springs apart. If the grease is not renewed excessive friction takes place between the plate surface, destroying the flexibility of the springs to a large extent. Fig. 20 shows the oil groove in the plates, with holes communicating from the top to each individual one. A small lubricator is fitted at either end of the top plate, which permits of oil being introduced between all the rubbing surfaces of the springs, which not only preserves the flexibility, but gradually increases the same as the plate surfaces wear smooth. The wheel gauge, or width between the wheels, is of an increased

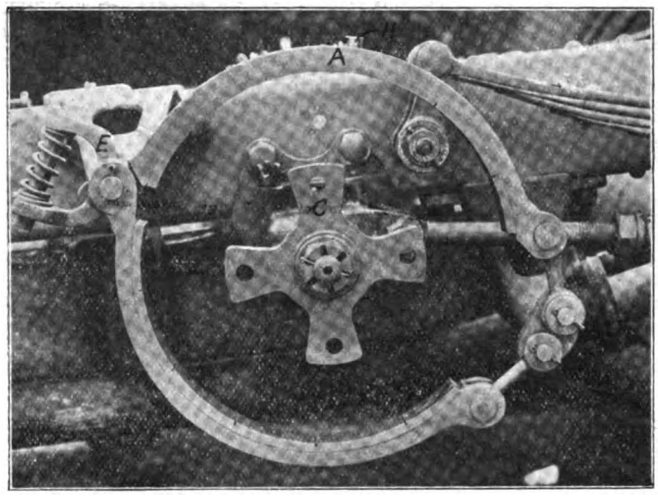

Fig. 21.—View of end of Differential Shaft with Chain Sprocket and Brake Drum detached.

dimension, viz., 4 ft. 6¼ in., allowing the load to ride easily between the wheels, whilst the overall dimension outside the axle caps is normal, being 5 ft. 2 in. The front of the frame being made specially narrow, in conjunction with the wide wheel gauge, provides an exceptionally large steering look, enabling the car to turn in short and narrow spaces. The road wheels, which are of the artillery type, are all of equal size, 870 mm. diameter, and run on Hoffmann ball bearings. The weight of the shortest *chassis* complete is 16¼ cwt. Three different lengths are made to suit various types of bodies, viz., 8 ft. 3 in., 9 ft. 3 in., and 9 ft. 9 in.

From the exhaustive description we have given of the "Brotherhood" car it will be seen that the builders have left

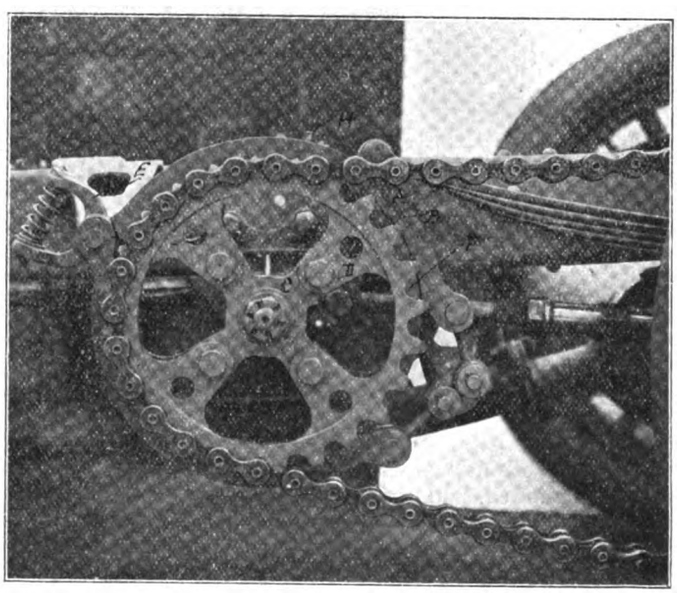

Fig. 22.—View of Brake and Chain Sprocket on Differential Shaft.

A. Steel brake band. F. Brake drum.
C. Brake drum and sprocket spider. H. Brake cleaning lubricator.

no stone unturned not only to produce an all-British car, but one which will quickly rank among the highest grade productions of the international automobile industry.

THE GORDON BENNETT DEADLOCK.

A SATISFACTORY SOLUTION.

THE race for the Gordon Bennett Cup and the Grand Prix of the French Automobile Club are to be separated and run with a fortnight's interval between them upon dates yet to be decided upon. Such is the result of the important meeting of the International Committee of the Gordon Bennett Cup which took place at the A.C.F. Club House in Paris on Monday, when the representatives of eight national automobile clubs met to discuss the situation created by the French Club in deciding to amalgamate the Cup race with a Grand Prix event founded by itself. The decision to separate the two races was not arrived at without considerable discussion, and at one time it looked as if the meeting would prove futile. M. de Knyff especially took up a strong attitude, and declared that the French Club could not go back upon its decisions, and that the foreign clubs were dealing a death blow to the sport of automobile racing. In view of the strong opposition of the foreign delegates, the representatives of the A.C.F., however, held a private meeting, the result of which was made known at the afternoon gathering. It amounted to a decision to give way under certain conditions and to separate the races. A further discussion followed, and the details were soon arranged. When the committee rose it had been decided that the race for the Cup and that for the Grand Prix should be two separate events. No dates for the two races were fixed, but it was agreed that a fortnight's interval should take place between them, the Cup event to be decided first. It was also agreed that in so far as the expenses for the Cup race were concerned, they should be shared by all the competing clubs.

The resolutions also included one to the effect that from 1906 the Gordon Bennett Cup race shall be transformed into an open race, in which the contesting nations shall be represented in proportion to the importance of their industry. The method of fixing this representation was, however, left in abeyance. As the decisions of the International Committee force the A.C.F. to organise three races on the Auvergne circuit, namely, the French eliminating race for the French Cup team, the Cup race proper, and the Grand Prix, it was agreed that in the improbable circumstance of the Government refusing to authorise an additional race, the Cup race should be run in Belgium.

The deadlock caused by the A.C.F. has now been entirely removed so far as concerns the dispute between that body and the various other clubs which will take part in the Cup race. The only obstacle now in the way is the recent manifesto of certain French manufacturers announcing their decision to boycott both the Cup race and the Grand Prix if the two events were divided, but it is hardly likely that they will carry their threat into effect, seeing that the rules of the Cup event permit the A.C.F. to select three cars to represent France in the race without an eliminating contest.

The decision has naturally aroused considerable discussion in French motoring circles, but the more moderate section recognise that the A.C.F. only acted for the best by avoiding an international split which would probably have been more serious to the French motor industry than the threatened split at home. The general opinion in Paris is that after a little grumbling French manufacturers will accept the modified situation, particularly in view of the fact that the A.C.F., in agreeing to the representations of the foreign clubs, has secured concessions from the latter both with reference to the cost of organising the Cup contest and also as regards the conditions of future races.

Mr. and Mrs. Granville M. Kenyon on their Panhard Car. Mr. Kenyon is Honorary Secretary of the Kent Automobile Club, and is an Enthusiastic Motorist, this being his Twelfth Car.

A MOTOR-BICYCLE with a trailer parcel carrier is being employed in the postal service between Sittingbourne and Greenstreet.

CONTINENTAL NOTES.

The Republic Grand Prix Race.

The surprise of the week has been furnished by the new daily, "Les Sports," which announces that during the second week of June it will organise, in concert with the town of Aix-les-Bains, an important 500-kilometre race, to be run under the rules of the French Automobile Club. The race will be open to cars of all nationalities and of all makes, the only limitation being that any one manufacturer cannot enter more than three cars. The first prize, offered by "Les Sports," "Le Journal," and the municipal authorities of Aix-les-Bains, will be of the value of no less than £6,000, out of which the driver of the car will receive £800, and the mechanician £200. The entrance fee has been fixed at £160 per car, or £400 for a team of three. This is, of course, "Les Sports" answer to the "Auto's" £1,000 prize for the Grand Prix race. The municipal authorities of Aix-les-Bains were anxious to secure the Gordon Bennett contest for their district, and, having been unsuccessful, are throwing their energies into the Grand Prix de la Republique, which will be made the occasion of an automobile week, comprising motor-car, cycle and boat races, a gymkhana, and a battle of flowers.

◆ ◆ ◆

Details of New French Racers.

Some particulars of the new Clement-Bayard racers which are being built for the Gordon Bennett eliminating contest have just been made known. The engine will have four cylinders, 160 mm. diameter by 160 mm. stroke, and at a speed of 1,400 revolutions per minute is expected to develop about 120-h.p. The cars will have cardan shaft transmission to a rear live axle. The Panhard racers will, according to current report, be chain-driven, and fitted with four-cylinder engines 180 mm. diameter by 180 mm. stroke.

◆ ◆ ◆

A French Touring Competition.

The touring competition organised by the Automobile Club de Seine-et-Oise commenced on Sunday last, and will continue during the whole of the present week. Altogether fifty-two entries were received, these being divided into a number of separate categories. The programme consists of seven daily runs of about 200 kilometres each, starting and finishing at Versailles.

◆ ◆ ◆

Automobilism in Roumania.

Even in Roumania the automobile movement is making progress, as is evidenced by the recent formation of a Roumanian Automobile Club, with Mr. D. M. Sutgu as president, and headquarters at the Grand Hotel du Boulevard, Bucharest. The new club has just issued its annual handbook for 1905; this is printed in both Roumanian and French, and gives a good deal of useful information with regard to motoring in Roumania, and also for Roumanian motorists who intend touring in other countries.

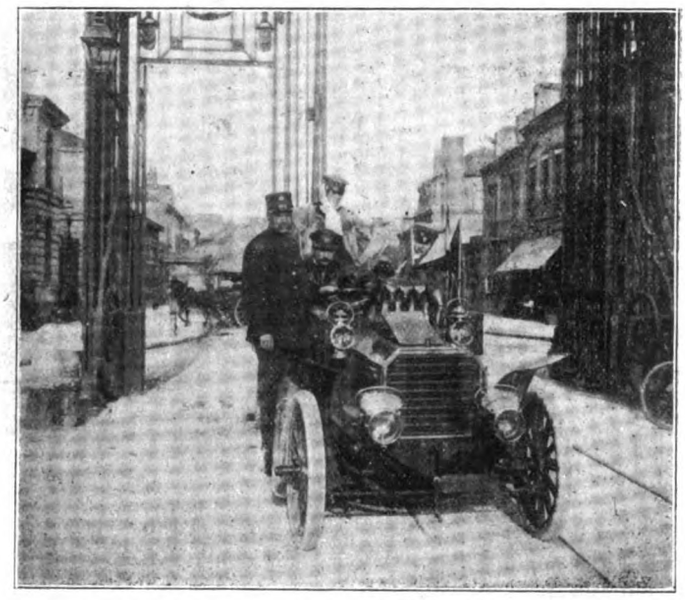
◆ ◆ ◆

A French Light Car Competition.

It was remarked at the last Paris *Salon* that but few French manufacturers were devoting attention to popular-priced light cars, for which there are in France, as well as in England, great opportunities, if only makers will make serious efforts to cater therefor. With the view of encouraging the development of the light car, the "Auto" proposes to organise a "voiturette" reliability trial in July or August next.

◆ ◆ ◆

A Dutch Automobile Week.



The Dutch Automobile Club has drawn up the preliminary programme of the automobile week to be held at Scheveningen in July next. The meeting will commence on the 10th with a series of kilometre speed trials for touring cars on the promenade. The tests will be from a standing start and a stopping finish. On July 11th kilometre speed trials for racing cars and motor-cycles will be held. Motor-boat racing will take place on the 12th, while driving and elegance competitions will form the programme for the 13th. The meeting will be brought to an end on the 14th July, when the start of a tour will take place from Scheveningen to Ostend.

◆ ◆

The Cannes Automobile Fortnight.

The automobile fortnight at Cannes commenced on the 12th inst. with an elegance competition, in which a large number of motorists took part. On Tuesday, the 14th inst., the contest for the Cannes Automobile Club Cup was commenced, the day being devoted to two of the different categories, viz., brake and consumption tests. The brake trials were held on the Vallauris hill, the object being to see which car could be pulled up in the quickest time after a signal. The Chevalier Florio on a 90-h.p. Mercedes pulled up in a distance of 36 ft., and M. Mounier on a 8-h.p. Renault in 39 ft. In the afternoon trials were held on a private track to ascertain which car could cover the greatest distance on a litre of petrol (1 litre equal 1·76 pints). M. Quinson on a 10-h.p. Gladiator proved to be the successful competitor, his distance being 15·4 miles. Wednesday, the 15th inst., was devoted to other categories of the cup contest, viz., speed over the level kilometre and a hill climb. The flying kilometre was held on the Jean Hebert Boulevard, and proved a victory for the Chevalier Florio's 90-h.p. Mercedes, the time being 30⅖ sec. The best time in the hill-climbing competition was made by the same gentleman's 60-h.p. Mercedes with seven persons up. In the general classification the 90-h.p. Mercedes of M. Florio secured the largest number of points—179·81—so that this gentleman carries off the Cup. M. Gallice on a 12-h.p. Clement-Bayard was second with 166·15 points, and M. Rouff on a 16-h.p. Rochet-Schneider third with 133·25 points.

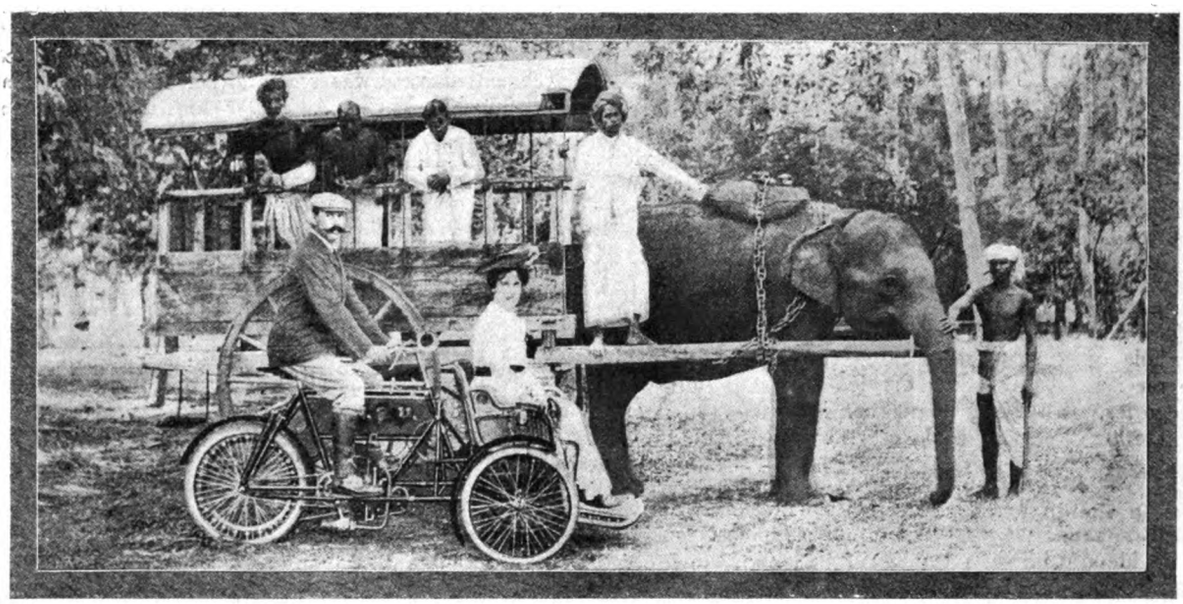
LONDON TO NORTH WALES ON A MOTOR-CYCLE.

By the Rev. Edwin Noyes, M.A.
(St. George's, Hanover Square, W.).

—◆—



SOME sixteen months ago the *Motor-Car Journal* published an account of a journey made by my wife and myself on our motor-cycle, from London to Buxton, in thirteen consecutive hours. I have now the pleasure of offering to the readers of this most useful paper an account of a similar journey we undertook last August, and successfully accomplished on the same machine, from London to North Wales in seventeen and a-half consecutive hours. When, however, I say the same machine, I must qualify the statement by adding that, instead of the 2¼-h.p. Kerry engine used on the Buxton journey, I now have a 3½-h.p., but this has scarcely given as much satisfaction as the old one, as the following account will show.

We left our home in the west of London at ten minutes to nine in the evening of July 31st, 1904, intending to travel all that night and all next day. The weather was all that could be desired, and half-an-hour after our start the moon rose, and the moonlight continued with us until dawn, so that there was practically no darkness. We got out of London by way of Wellington Road and Finchley Road, heading off for Chipping Barnet. At that hour of the evening there was but little traffic in our way, and we soon left London behind us. I found that our engine began to get uncomfortably hot with any hill work, and it was with some difficulty that I drove it up Barnet Hill. From Barnet we went quickly through to St. Albans, the moonlight now flooding the countryside and lighting up our road very distinctly. We passed on, following the Holyhead road, through Dunstable and Towcester without any incident worth recording except that the motor refused the hill at Foster's Booth, and we had to push the machine up.

The dawn of August 1st was very lovely, and the stillness was unbroken save by the noise we ourselves continually made, and shortly after daylight we arrived at the good old town of Daventry. Here, having had nothing to eat or drink since our start, we came to a halt, and, sitting on the kerb stones of the little town, we made tea. There was no one stirring. Never had tea tasted so good! The sandwiches we had brought were shaken into crumbs by the vibration, so that we had not much to eat; however, we pushed on in the strength of the tea, and in due course arrived at Coventry, and between six and seven o'clock we were in Birmingham. Here there were signs of life and of the August Bank Holiday. Enquiring the way to Wolverhampton, I received so many suggestions and contrary directions that I got completely out of my way, and went a long way round through Dudley and a host of other places, and over several appalling hills, arriving at Wolverhampton somewhere about half-past seven. Here we waited until the shops were open, and then had breakfast, and took in a fresh supply of petrol. On the way to Shrewsbury the luggage carrier gave way, and deposited tools, petrol cans, sandwich bags, and other articles with a crash in the middle of the road. Having repaired this damage with the help of the invaluable bifurcated copper rivet, and of the useful wire nail, we proceeded without further mishap to Shrewsbury and thence to Oswestry. Here the engine commenced seriously to overheat, and our progress became somewhat slow. However, in spite of the heat of the engine and the heat of the day, we passed on through the Vale of Llangollen, and Llangollen itself, to Corwen, and thence to our destination, some seven or eight miles farther on.

I afterwards found that the reason of the overheating of the engine was partly due to a defective inlet-valve spring, which had been practically burnt away, so far as its elasticity was concerned, and partly, of course, to the sheltered condition of the engine behind the fore-carriage. The fans with which the engine was cooled were of but little use. Deducting the time we stopped for meals and repairs, we had travelled for 17½ hours, and had covered a distance of 202 miles, including the seven miles travelled out of our direct way, owing to being misinformed as to the road. By that time we had had enough, and were glad to stop for the night.

After staying some weeks in North Wales, we returned from Llanfair, in Anglesey, to Birmingham by the coast road in one journey, about 145 miles, and then finished our holiday by an eight hours' run from Birmingham to London. In my opinion, there are few vehicles for two to equal the fore-carriage for reliability, for interest, and for the dash of adventure which lends motoring its charm. But, to be perfect, the machine should have three things:—(1) A water-cooled free engine of 4 to 5 h.p.; (2) a chain drive; (3) a two-speed gear; and then I believe this vehicle, properly driven, would carry two persons anywhere in reason.

A Contrast in Locomotion in India.

[*Automobil Welt*

A motor garage at Bishopton Lane, Stockton-on-Tees, has been opened by Mr. J. Dawson.

HERE AND THERE.

THE Bell Hotel, Derby, is specially catering for the wants of motorists.

A SCHEME of technical instruction in motor-car driving is being arranged at Redhill.

IT is reported from Nice that King Edward will probably be present at the Monaco motor-boat race meeting.

FOUR HUNDRED THOUSAND passengers were carried by the road motor-cars of the Great Western Railway Company during the past half-year.

THE SALE ELECTRICAL INSTALLATION COMPANY have made arrangements for the recharging of accumulators at their premises at Sale, near Manchester.

THE AMERICAN COULTHARD COMPANY has been formed at Minneapolis, U.S.A., with a capital of £40,000, to manufacture Coulthard steam wagons in America.

THE WHITLOCK AUTOMOBILE COMPANY, LIMITED, have sent us a copy of their new catalogue of Whitlock cars, which are being made in five sizes, 12-h.p. and 14-h.p. double-cylinder, and 15-h.p., 22-h.p., and 28-h.p. four-cylinder. The cars throughout are on modern lines, being fitted with the latest types of Aster engines.

UNDER the direction of Captain Bagnall Wild, R.E., Secretary of the War Office Committee on Mechanical Traction, some experiments with the Pedrail have been conducted at Aldershot. The machine passed with great ease over the loose sand of the Long Valley, drawing a wagon loaded up to five tons, and climbed some very stiff gradients.

A STAFF RIDE conducted by Major-General Sir Reginald Hart, V.C., commanding the Thames District, has been held between London and Brighton, at which the following members of the Motor Volunteer Corps were employed:—Captain A. Booth-Hearn, Captain L. E. Scarth, Lieutenant F. W. Leith, Messrs. H. Baker, J. Rochford, and A. Cox.

A CORRESPONDENT, writing from Naples on the 3rd inst., says, "You may be interested to hear of a splendid run made by my 6-h.p. Wolseley light car. It ran from Rome to Naples, a distance of 140 miles, in six and a-half hours, an average speed of twenty-one and a-half miles per hour, a wonderful performance for such a small car considering the bad Italian roads."

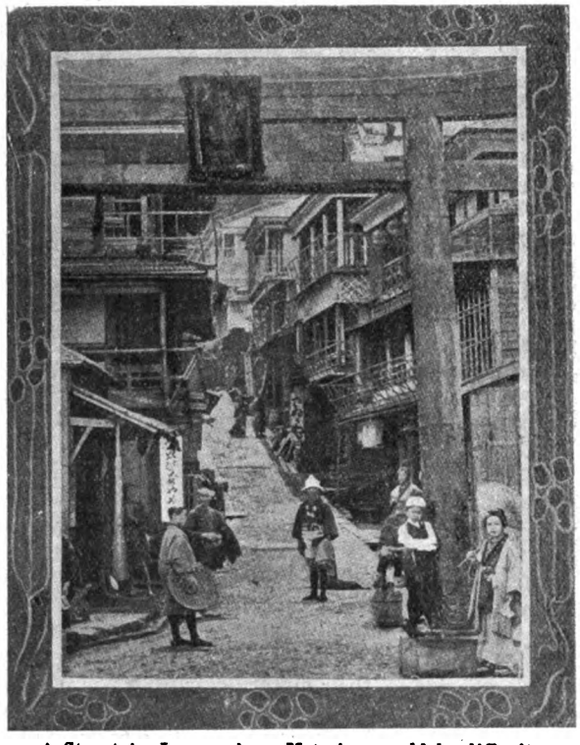
MR. W. LESLIE, of Calcutta, has won the first prize in the Bengal Reliability Trials on a 12-h.p. Lanchester car. This exploit, with the excellent performance of Prince Ranjitsinhji's car in the Delhi-Bombay trials, proves that the Lanchester car is an excellent one for touring in hot, rough countries, and the fact that Mr. Leslie has no trained mechanic is a further point in its favour.

THE LONDON MOTOR-CAR COMPANY, LIMITED, has been registered with a capital of £15,075, to carry on the business of hirers or letters of vehicles, motor-vehicles of all kinds, and to adopt an agreement with Mr. G. H. Baillie. The first directors are Messrs. G. H. Baillie, R. H. E. Stevens, and W. W. Claypoole, and the registered office is 82, Victoria Street, Westminster, S.W.

THE HOZIER ENGINEERING COMPANY, LIMITED, has sent us a copy of the 1905 catalogue it has just issued. The production is in all respects worthy of the company, as not only are the various types of Argyll cars illustrated, but the different parts of the *chassis* are described and shown in detail in clearly-drawn sketches. Several pages are devoted to useful hints for owners of Argyll cars.

MESSRS. J. P. HOWARD AND CO., Sun Street, London, E.C., have sent us a sample of a new soap, known as "Ahoy," they have recently introduced, and which is specially prepared for removing dirt and grease from the hands. The advantages claimed for the soap are that it is equally effective with hot or cold water in removing grease or oil, that it has a softening effect on the skin, and that it cleanses and heals cuts and scratches.

ATTEMPTS are being made to restrict the speed of motor-cars within a three-mile radius from the centre of Johannesburg to eight miles an hour.



MOTOR-CARS and automobile parts to a value of £379,502 were last year exported from the United States, as compared with only £328,605 in 1903.

THE PEACOCK AUTOCAR COMPANY has taken premises on Royal Exchange Square, Glasgow, where they will repair old cars and act as agents for new ones.

THE White steam cars are now being introduced into Holland, Messrs. L. R. Goettsch and Co., of Utrecht, having been appointed the agents in that country.

MR. W. F. BAILEY, Estates Commissioner of the Irish Land Commission, recently purchased a 10-12-h.p. Argyll car, which he has been using in the west and south of Ireland.

RECENT elections to the A.C.G.B.I. include the Marquis of Headfort, the Earl of Dunraven, Sir J. Brunner, Bart., M.P., Sir Thomas Sutherland, G.C.M.G., Sir Alfred Sharpe, K.C.M.G., and Sir George Bullough.

A Street in Japan where Motoring would be difficult.
[*Motor, New York.*

MR. REGINALD HADDON is the author of "The Inventor's Adviser"—an instructional guide to the commercial development of inventions, their protection by patents at home and abroad, and the valuation and disposal of patent rights. It is published by Messrs. Harrison and Sons, and will be found useful in view of the new law which came into operation with the beginning of the year.

IN their half-yearly report the directors of the London General Omnibus Company say that they have decided to make extensive trials of automobile traction, and have several types of motor-omnibuses on order for that purpose. Under these circumstances they recommend that £20,000 be placed to the account of a special motor fund, to be expended in carrying out the proposed experiments.

MESSRS. ALFRED DUNHILL, LIMITED, have received the awards at the Crystal Palace Show for the most complete outfit for car, the best summer outfit for owner, lady passenger and man, and also for the best winter outfit for owner, lady passenger and man. Special awards were made to Messrs. Longstreths, Ltd., for the Lithanode unspillable accumulator, and to Gratz Patents, Ltd., for the Gratz speed indicator and recorder.

A MOTOR-'BUS service is being established between Leamington and Warwick.

THE three Fiat racers for the 1905 Gordon Bennett race will, it is stated, be fitted with engines of 120 h.p.

A MOTOR-CAR exhibition, under the patronage of the Hungarian Automobile Club, is to be held in Budapest from May 7th to 21st next.

THE MANCHESTER MANUFACTURING COMPANY, of the Carwal Works, Manchester, have just brought out a steering wheel wind shield, of which we give an illustration herewith. As will be seen, it is designed to clip on the steering pillar and to protect the driver's hands and chest from the wind and weather. It is made in tinned steel, aluminium, copper and brass, a ⅜ in. brass bead giving a neatly-finished appearance.

MR. A. P. TYLER has joined Messrs. Wilcocks and Son, and they will now trade as motor-car repairers under the style of Wilcocks, Tyler, and Co., at 54, St. Andrews, Uxbridg·

THE Eastbourne Motor Works have erected six lock-up motor houses at their fire-proof garage in the southern resort, and are making arrangements for the letting of motor-cars on hire during the forthcoming summer.

DRIVING from London to Birmingham last week on a 12-16-h.p. two-cylinder M.M.C. car which he had just purchased from the London showrooms of that company, a budding motorist, who had never driven such a car before, completed the journey without a stop, save for purposes of refreshment.

THE NEW MOTOR SYNDICATE, LIMITED, has been registered with a capital of £5,000, to carry on a business not particularly described except in the title. The registered office is Basildon House, E.C., where, too, are the headquarters of the Motor Omnibus Construction Company, Limited, which has been registered with a capital of £10,000.

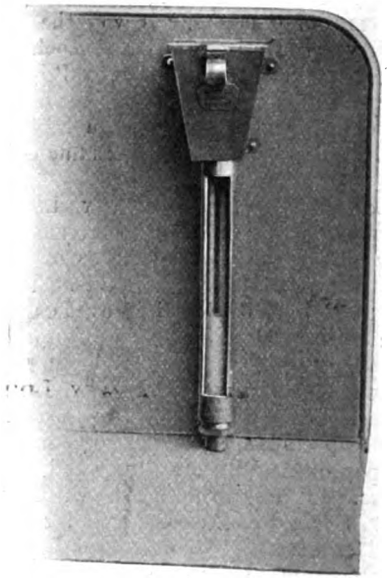
IT is not generally known that Messrs. S. Bowley and Son, in addition to their red-can motor spirit, are large manufacturers of motor-lubricating oils. We have received a sample tin of the water-cooled variety known as "Champion B," which we are submitting to trial, and hope to report on the same in the course of a week or so.

A NEW catalogue of their motor accessories has been issued by Messrs. Markt and Co. These include the well-known Veeder odometers, the Jones odometer, the Veeder speed indicator, motor horns, foot-bells, wrenches, volt and ampere-meters, sparking plugs, goggles and masks, jacks, oils, and the score of other accessories necessary to the complete equipment of the modern motorist.

A SERIOUS motor-car accident has occurred at Kingston Hill. A car with Captain H. Walker and Lieutenant Eyre, of the 1st Life Guards, on board, was being driven down the hill, when, in passing a carrier's motor-wagon, the vehicle skidded and collided with a lamp-post, throwing out the occupants. Captain Walker sustained an injury to the brain, and was taken to a neighbouring doctor's house, where he was detained. His companion and a chauffeur escaped with a shaking, but the car was much damaged.

THERE can be no question that the motor-car industry in this country is rapidly attaining the position of importance that it merits, and in this connection we are pleased to be able to announce, on the authority of the Star Motor Agency, Limited, that an agency in Paris for the well-known Star cars has been arranged with M. Lamberjack, who has been connected with the sport and trade in France since its inception. M. Lamberjack has ordered one of the Star 10-h.p. four-cylinder cars for his own personal use, and hopes to be able to secure many orders in Paris for similar vehicles.

THE Harrogate Corporation have been approached by a local firm of estate agents with a view to sanction being given to run a service of motor-'buses in the town.



THE Derbyshire roads are in such a bad condition that the Sheffield and District Automobile Club is suggesting that the county road authority should make improvements before the commencement of the touring season.

THE WILKINSON TYRE AND TREAD COMPANY (1905), LIMITED, is inviting subscriptions towards its capital of £14,000 to acquire the business and patents of the Wilkinson Tyre and Tread Company, Ltd., of Huddersfield.

THE Local Government Board has intimated to the Kingston-on-Thames Town Council that it is prepared to entertain an application for the closing of Bank Lane, a narrow thoroughfare leading to the riverside, to motor traffic. It is not satisfied, however, that the safety of the public demands the imposition of a ten-mile motor speed limit to the whole borough. The council has now formally applied for an order for the closing of Bank Lane and for the imposition of a ten-mile speed limit in the case of a number of narrow streets in the borough.

PRIOR to the Brussels Salon, Messrs. Gregoire, represented in this country by Messrs. Osborn and Lord, subjected one of their 6-8-h.p. two-cylinder light cars to a long test run. The tour took in the following places:—Poissy, Paris, Meaux, Reims, Rethel, Sedan, Arlon, Liege, Namur, Charleroi, Mons, Courtrai, Ghent, and Brussels. The trip extended over five days, and the distance covered was about 700 miles. Very bad weather was encountered, in addition to the wretched roads in Belgium, but the only trouble was the breakage of one front spring, due to a slight collision with a wall.

WE illustrate herewith a combination filler, strainer and gauge for use in connection with the petrol tanks of motor-cars, which has recently been put on the market by Mr. A. C. Davison, of Pleasant Road, High Street, Camden Town, N. The device, which is arranged to be fitted on the dash-board of the car and is more especially designed for use in connection with tanks located beneath the driver's seat, consists of a metal box or funnel with hinged lid and containing a removable strainer of fine phosphor bronze gauze. This box is fitted, underneath, with a large size magnifying gauge glass, and this again communicates by means of a ¾ in. pipe with the petrol tank. The apparatus is substantially made and is supplied with pipes cut and fitted to suit any car, the only work required being the attachment of the union to the bottom of tank and the screwing of the filler to the dash. By its use the driver can also see by a glance the petrol level, while the tank can be filled without him leaving his seat or disturbing passengers or cushions. Furthermore, no funnel or strainer are required.

The Olympia Motor-Car Show.

(*Continued from page* 1068).

A NEWCOMER to the ranks of the list of builders of all British cars is Messrs. LEGROS AND KNOWLES, LIMITED, who have on view a 20-25-h.p. *chassis*, a feature of which is the accessibility and detachability of the various parts. In general arrangement the car follows the general lines of chain-driven vehicles. The engine (Fig. 20) has four cylinders 4¾ in. diameter by 4¾ in. stroke, the normal speed being 750 revolutions per minute. The inlet valves are in the cylinder head, and the exhaust valves in side pockets, both operated off one cam shaft. The brasses and guides throughout are of a special aluminium bronze. The amount of opening of the inlet valves can be varied by an eccentric shaft controlled by a handle on the steering wheel. The two cam shafts—valve and ignition—are held up into their casing in the same way as the crank shaft. The casings are entirely closed in and are so designed that it is possible to remove the whole of either cam shaft with its pushers and guides without disturbing any other part of the engine. The bottom half of the crank case can be removed, the crank shaft bearings being held up to the frame by the caps instead of the usual practice of supporting the lower half of the bearings in the base chamber itself. This allows the main bearings to be adjusted separately without removing the shaft and flywheel. The big ends are also immediately accessible for adjustment when the base chamber is removed, and large, easily-removed inspection doors are provided to permit of inspecting the big and little end bearings.

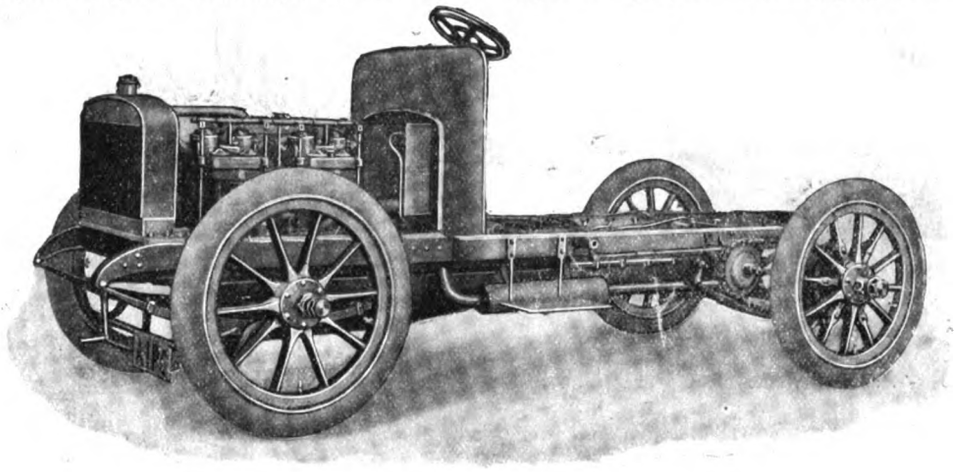

Fig. 19.—View of Chassis of Legros and Knowles 20-25-h.p. Car.

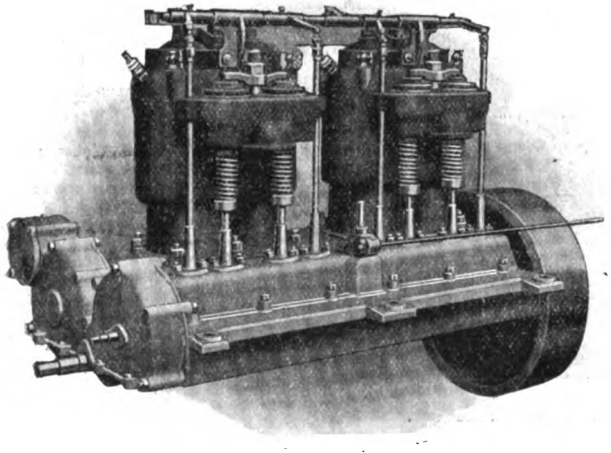

Fig. 20.—The Legros and Knowles 20-25-h.p. Motor.

Low tension magneto ignition is fitted with automatic advance gear, operated by a special governor. Provision is also made for fitting high tension ignition if specially required. A separate governor, acting on the inlet, keeps the engine at a normal speed, which is quickly reduced when the clutch is disengaged. The motor is bolted to the main frame between springs, which prevents the engine frame being distorted by the car-frame strains and diminishes the vibration communicated to the car by the engine. The carburettor has been designed to give increased air admission with increase of speed, the variation in mixture being automatically adjusted. This renders the engine extremely flexible and permits variation of speed within wide limits without changing gear. Under some conditions, for example when starting on a rising gradient, it is necessary to run the engine at high speed before engaging the clutch. The controlling gear has consequently been so designed that the accelerator and the clutch pedal both act quite independently of each other on the governor gear. The clutch is of the leather-faced cone type; the spring is placed away from the clutch in such a position that it is easy of access for adjustment. The power is transmitted from the clutch by a double driving arm through a cardan shaft to the gear box. The clutch can be withdrawn for re-leathering by merely disconnecting the cardan shaft. The gear-box is suspended from three points, the front being pivoted so that any movement of the frame produces no distortion of the box. The same facility for adjustment from below is afforded as in the case of the engine. Four speeds forward and a reverse are provided, the connections being such that when any one gear is in mesh all the others are automatically locked. From the differential shaft the power is transmitted to the rear-road wheels by side chains. The car is provided with three brakes—one on the differential shaft and one on each of the two back wheels. The former is operated by a pedal, and the latter by a hand lever which pulls towards the driver. A compensating gear is provided for the side brakes, which ensures equal effect on each wheel independently of the adjustment. All three brakes are internally expanding, cast iron on steel; the design is such that the brakes may be readily and quickly adjusted from accessible positions and without requiring the removal of the wheels to take up wear. Altogether it would appear that the new Legros and Knowles car has been the subject of much thought, not only as regards

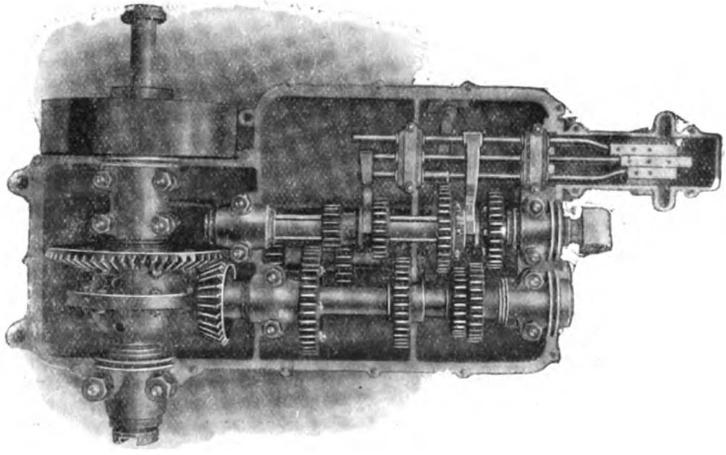

Fig. 21.—The Legros and Knowles Change-Speed Gear.

Digitized by Google

design, but also as regards materials, nickel steel entering largely into the construction of the various parts.

The VULCAN MOTOR COMPANY, LIMITED, Southport, exhibited three sizes of cars, which, without comprising any striking departure from the standard practice of live-axle vehicles, were worthy of close inspection, being of sound construction and of moderate price. We first examined a neat 10-h.p. tonneau. The engine comprises two vertical cylinders, 3¼ in. bore by 4¼ in. stroke, fitted with mechanically-operated inlet valves. The carburettor is of the automatic air-regulating variety, fitted with throttle, acted upon both by the governor and by hand and foot levers.

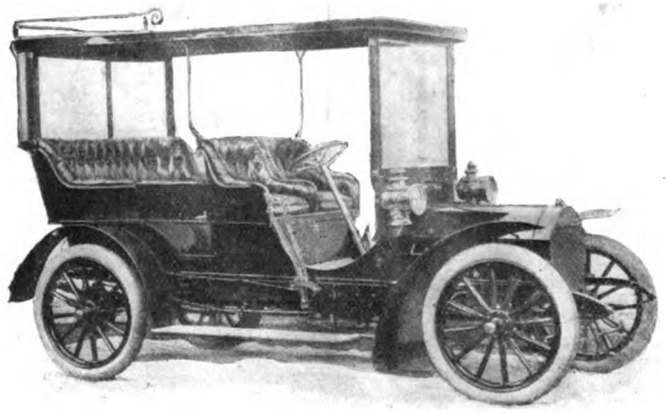

Fig. 22.—The Vulcan 18-20-h.p. Side-Entrance Double Phaeton.

engines, the dimensions of the largest size being 125 mm. bore by 140 mm. stroke. The carburettor has been improved, the jet being mounted on a conically-seated plug, held in position by a spring underneath the mixing chamber in such a way that it can be quickly removed for cleaning purposes. A useful fitting in the form of a lever, easily operated from the driver's seat, is also provided to entirely shut off the petrol supply to the jet, when coasting down long hills, enabling a considerable economy of petrol to be effected. The change-speed gear, the bevel drive to the

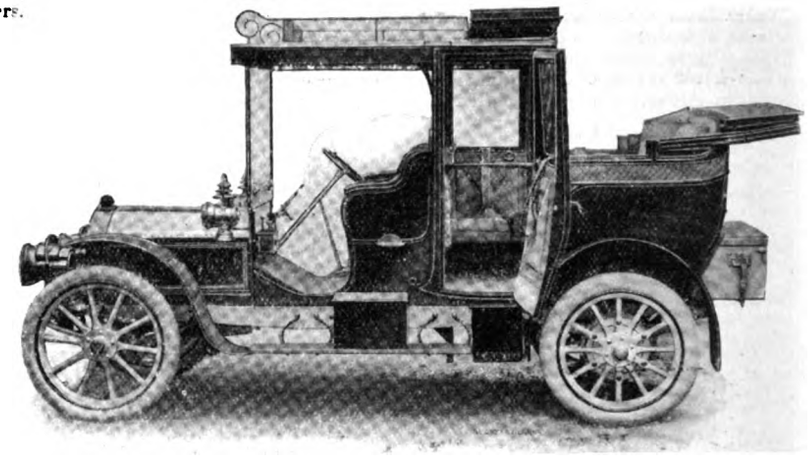

Fig. 23.—The Martini Saloon Car.

The transmission is through a leather-faced, cone-clutch gear-box giving three speeds forward and reverse on one lever, cardan shaft and bevel gear to the live axle. The latter is well supported, and the differential is of the straight pinion type instead of the usual bevel wheels. The Vulcan 12-14-h.p. car was next inspected. This is on modern lines throughout, having a pressed steel frame, and honeycomb radiator with fan. The engine has four cylinders, 3-in. stroke by 4-in. bore, the normal speed being 1,000 revs. per minute. The Vulcan 18-20-h.p. car has a four-cylinder engine, consisting of two pairs of the motor fitted in the 10-h.p. cars; except that the ignition is by high-tension magneto, its details are similar to the 12-14-h.p. car. The brakes are all centred on drums connected with the rear road wheels, a pedal actuating bands expanding within the drums while a hand lever controls bands contracting on the exterior surface of

countershaft, and the differential on the latter, are all enclosed within one case. A long shaft fitted with a universal joint transmits the power of the engine through the clutch to the gear-box. Four speeds and a reverse are provided, the two shafts in the gear-box being now in the same horizontal plane. The differential runs on four sets of ball bearings, the outer pair being close to the chain wheels, in order to obviate any danger of the shaft springing owing to the pull of the chains. The petrol is pressure fed, but the pressure is kept up not by the exhaust, as usual, but by a special air pump. The complete cars on view included a 20-24-h.p. landaulet with Thrupp and Maberly body and a special 30–40-h.p. touring car (Fig. 23). The body of the car is unique of its kind and attracted great attention at the last Paris Show. It is very handsomely fitted inside, a special table being provided for card playing. There are also writing

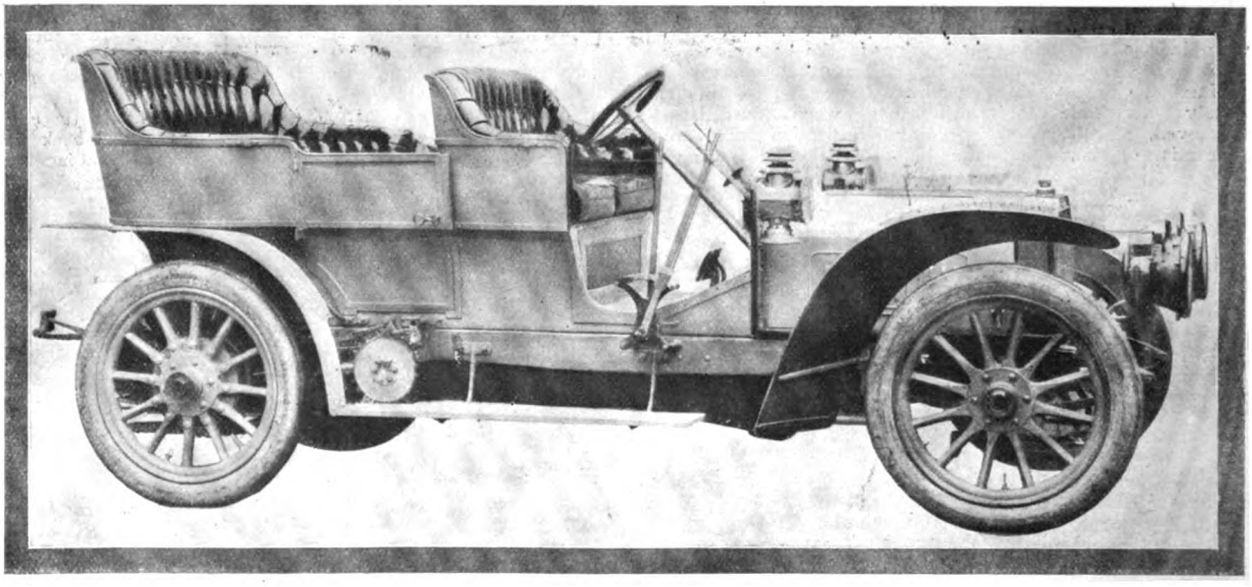

Fig. 24.—The Rochet-Schneider 24-30-h.p. Side-Entrance Car.

the same. The Vulcan cars are better known in the North than in the South, but we have heard very good reports of the 1904 models, and the reputation they have earned should be more than maintained during the coming season.

Messrs. H. H. P. DEASY AND COMPANY, LIMITED, displayed the features of the well-known Martini cars by means of a 20–24-h.p. *chassis*. We learn that for the 1905 season the cars are to be made in three sizes—16–20-h.p., 20–24-h.p., and 30–40-h.p. All are fitted with four-cylinder

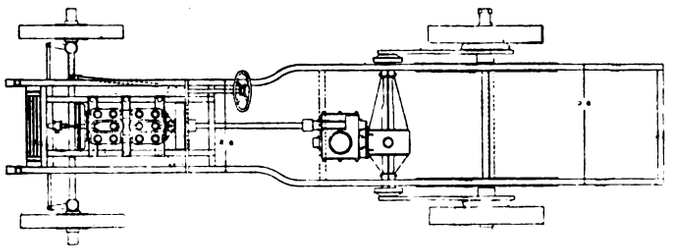
materials, dressing-case, and so forth, and the seats can be arranged so that the occupants can recline.

The 1905 models of the Rochet-Schneider cars were so fully described in our issue of the 24th December last that it is only necessary to mention that the British agents, Messrs. DONNE AND WILLANS, LIMITED, exhibited a Lonsdale wagonette fitted on a *chassis* of the 24-30-h.p. type. The engine comprises four cylinders, 120 mm. bore by 140 mm. stroke. The inlet valves are mechanically operated and are interchangable with the

Digitized by Google

exhaust valves. A device is now fitted whereby on placing the starting handle in position the compression is automatically released, so facilitating the starting of the engine. The low-tension system of magneto ignition is still retained; the water is circulated by a gear-driven pump through an improved form of honeycomb radiator with fan; the latter runs on ball bearings, and is driven by an adjustable belt. The change-speed gear has been considerably modified, the two shafts being now arranged in the same horizontal plane. Four speeds forward and a reverse, with direct drive on top speed, are provided, the transmission from the differential countershaft being by side chains. The clutch is of the metal-to-metal type; the axles are of nickel steel of H section, while the equal-sized road wheels run on ball bearings. Messrs. Donne and Willans have also taken up the British agency for the "La Locomotrice" cars built by Messrs. Nagant and Company, of Liege, under the Rochet-Schneider licence, and of this Belgian model a very fine specimen of engineering was to be seen in a 24-30-h.p. *chassis*. A new car was also to be seen in a 16-24-h.p. "Belgrave" side-entrance double phaeton. This is built on the usual lines of cardan shaft and live axle cars, and is fitted with a four-cylinder engine, 110 mm. diameter by 130 mm. stroke. An automatic carburettor furnishes the mixture, and with wheel control, metal-to-metal expanding brakes, honeycomb radiator, and automatic lubrication, appears to well meet the demand for a powerful car at a moderate price.

Ryde Motors, Limited, had two stands, on one of which is shown a well-finished example of the "Ryde" 14-16-h.p. three-cylinder tonneau car, of which an illustrated description was given in the *Journal* early last year. The vehicle is driven by cardan shaft and bevel gear on to a live axle, and has three speeds and a reverse, with a direct drive on the top speed. The mixture is furnished by an automatic carburettor of the company's own design. The Ryde Company are also now devoting much attention to heavy commercial and public service vehicles, and exhibited the *chassis* of a new two-ton petrol lorry they have lately introduced. This has a channel steel frame, in the fore part of which is set a vertical 15-h.p. two-cylinder engine 4½ in. bore by 6 in. stroke, the valves being all mechanically actuated and arranged on opposite sides of the engine. A special form of framed ribbed-pipe radiator is used in connection with



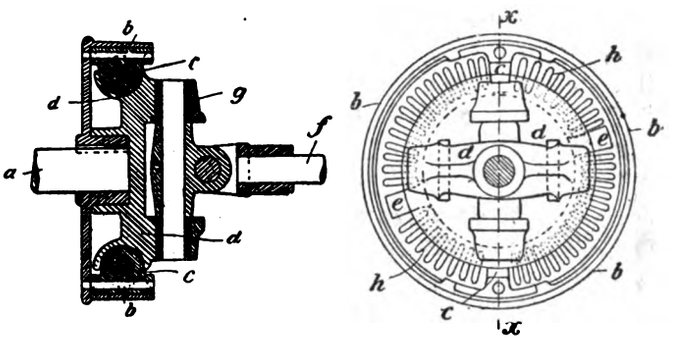


Fig. 25.—Plan of Chassis of Ryde Five-ton Motor Lorry.

the water circulation, which is maintained by a slow-running pump. Four speeds, with a maximum of about twelve miles per hour, and a reverse are provided, the transmission being through a leather-faced cone clutch, gear box, and side chains. The gear-box has three point suspension, the forward support having a spring interposed to take up any strain. The vehicle appears to have been well thought out in its various details, and the company are to be congratulated on their enterprise in the field of commercial automobilism. A 30-h.p. engine intended for a thirty-four-seated double deck omnibus they are building was also on view. This comprises four cylinders, 4½ in. diameter by 6 in. stroke, and represents the type which are to be fitted to the Ryde five-ton petrol lorries.

A selection of motor clothing for ladies, gentlemen and their servants was shown on Messrs. Burberry's stand, where the "Viator" motor ulster, in both tweed and frieze, was a notable exhibit. An assortment of accessories illustrated the firm's desire to completely equip their clients with all their motoring requirements.

The "H.F. Standard" and "H.F. Car" vulcanisers have already been illustrated in the *Journal*, while their excellent features are generally recognised by motorists and the repairers of tyres alike. A new self-contained vulcanising appliance is being introduced, by means of which two tyres can be completely retreaded at one operation. The "H.F. car" vulcaniser is specially intended for repairing tyres by the roadside should sudden emergency arise, and can be carried on the car. Messrs. Harvey Frost and Company have certainly devoted much study to the vulcanising of tyres and their experience has resulted in some good types of appliances.

The Institute of Chauffeurs, Limited, the British agents for the cars made by the Société Metallurgique, of Marchienne, Belgium, exhibited for the first time a couple of the "Metallurgique" cars. These are built in a number of sizes, including 8-h.p. and 12-h.p. two-cylinder and 12-h.p., 16-h.p., 24-h.p., and 30-h.p. four cylinder. The main features are pressed steel frames, an internally expanding metal clutch, and a spring drive on the rear end of the cardan shaft, the transmission being by live axle. The expanding clutch takes the form of two brake segments, which are expanded against the inside surface of the fly-wheel rim by means of a cone sliding on the clutch-shaft, and actuating the segments by means of short arms carrying rollers at their ends. The spring drive is mounted in a drum, *b* (Fig. 26), set on the end of the bevel pinion spindle, *a*, having two lugs, *c*, opposite to each other projecting inwards from the rim. The cardan shaft ends in a forked piece, *d*, each end of which bears against one end of a spiral spring, *h*, laid round the disc, and bearing as to its other end on one of the projecting lugs, *c*, the power being transmitted through the forked ends, the springs, and the lugs on the drum, and by the latter to the bevel pinion. The device is claimed to prevent shock on the bevel drive and to considerably reduce the noise.

Figs. 26 and 27.—Details of La Metallurgique Spring Drive.

The four-cylinder engines have mechanically operated inlet valves with variable lift device. The ignition, which is by coil and accumulators, with friction-driven dynamo to keep the latter recharged, is so arranged that when the clutch is withdrawn or the brakes applied it is automatically retarded. The cars exhibited included a 16-h.p. *chassis* and a handsome 24-h.p. coupé limousine.

The Cadogan Garage and Motor Company, Limited, had on view a 15-18-h.p. Durkopp side entrance double phaeton. The engine comprises three cylinders, 94 mm. bore by 120 mm. diameter. The inlet valves are mechanically operated and are located on the opposite side to the exhaust. Three speeds and a reverse are provided, the transmission being by means of side chains from the differential shaft. The novelty at the stand was the "Octopus" hydraulic clutch which is being introduced by the Wilkinson Sword Company, Limited, of Acton. The device, which has been designed by an Italian engineer to take the place of the ordinary leather faced clutch, is illustrated in Fig. 28, from which it will be seen that the flywheel rim 1 is cast eccentrically with regard to its thickness, but for the purpose of balancing the wheel the eccentricity of the circles forming the inner edges of the rim are opposed to each other. On a squared portion of the clutch shaft 12 is mounted the clutch body, which is cast of phosphor bronze, to form four plunger barrels and four valve chambers. In the plunger barrels are set plungers 6 carrying at their outer forked ends friction rollers. In view of the fact that the

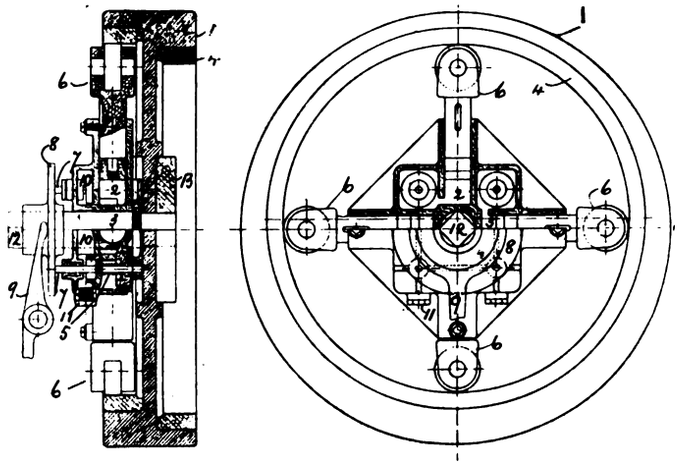

Fig. 28.—Sectional Elevation and Front View of Octopus Hydraulic Clutch.

9. Lever to operate the disc from the pedal.
10. Central chamber.
11. Screw tap.
12. Shaft.
13. Flange.

clutch body is mounted on the clutch shaft, the centre of which is the centre of the flywheel, it will be seen that as the flywheel revolves the plungers 6 must move up and down in their respective barrels, if there is nothing therein to impede such movement, or if the clutch body is held stationary. This reciprocating movement of the plungers is, of course, due to the eccentricity of the inner periphery of the steel ring 4 to the centre of the clutch shaft. The two vertical plungers are shown at either extreme of their strokes, the upper one being right out and the lower one right in, while the two in

Digitized by Google

the horizontal position are at half-stroke. The hollow parts of the clutch body are filled with oil, and the plungers can make the up and down motions in the respective barrels so long as the oil is free to flow from one part to the other; but when the clutch is in, or driving, the oil cannot so circulate, this being only possible by the lifting of the valves 7 from their seatings. While they remain closed the oil cannot pass from beneath a descending plunger to below a rising plunger; consequently, the eccentricity of the inner surface of the flywheel causes the flywheel and the clutch body to become locked together, the power of the engine being

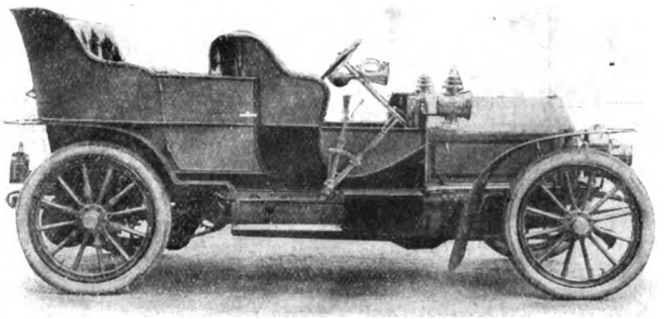

Fig. 29.—The Siddeley 18 h.p. Side-Entrance Double Phaeton.

transmitted to the gear-box. When the clutch has to be disconnected the fork arms 9 are caused to exert pressure upon the sliding disc 8, which in its turn conveys this pressure equally upon the four projecting ends of the valve spindles 7. By these means the four valves can be raised from their seatings to any desired degree, so bringing about as much or as little slip of the clutch as is desired. The valves are so arranged that the higher the lift of the same the greater the quantity of oil circulating through them. The clutch is claimed to be both smooth and certain in its action.

The great centre of attraction at the stand of the SIDDELEY AUTOCAR COMPANY was the identical 12-h.p. vehicle which recently completed the 5,000 miles trial. The engine, change-speed gear, and other parts of the transmission had been taken down and opened out so as to enable visitors to see for themselves the very small amount of wear that had taken place during the exhaustive trial. Of the 18-h.p. four-cylinder cars a *chassis* was shown, as also a handsome limousine with Hooper body, the wheel base being 10 ft. 6 in. In addition to the popular Siddeley two-seated car with 6-h.p. horizontal engine, a car of similar power, but with

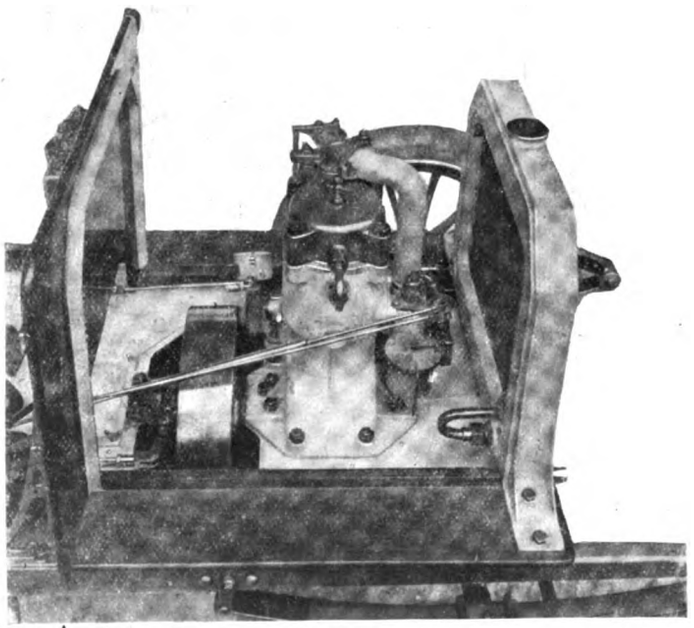

Fig. 30.—The Siddeley 6-h.p. Vertical Motor.

a vertical motor, is now being introduced. A view of the engine of this is given in Fig. 30. The cylinder is 4½ in. bore by 4½ in. stroke, the normal speed being 900 revolutions per min. The water-jacket and upper half of the crank-case are in one casting. The explosion chamber, with its water-jacket and valve chest, is a separate casting bolted on to the lower part. The valves are mechanically operated off one cam shaft, the inlet valve being located in the cylinder head. The pump is driven off the cam shaft. The commutator is also actuated off the cam shaft through bevel pinions, so that it is brought into a most accessible position. The radiator is of the ribbed tube type set in a frame forming the water tank. The transmission is also a new departure for the Siddeley Company, being through an internal cone clutch, gear-box, cardan shaft, and live axle. The change speed gear-box, which is supported directly on the pressed steel frame, is adapted to give three forward speeds and a reverse. The cardan shaft and the axle are completely enclosed in an aluminium casing.

The foot brake acts upon a drum on the cardan shaft, and the hand brakes on drums connected with the hubs of the rear wheels. The clutch and brake pedals are of the push-forward variety, and the hand brake lever of the pull-up type. The brake pedal is connected with the throttle in such a way that when the brake is applied the speed of the engine is automatically reduced.

Messrs. F. G. PICKERING AND COMPANY, LIMITED, who have devoted much attention to heavy commercial vehicles, exhibited one of their two-ton petrol lorries. The engine is a four-cylinder one of 20-24-h.p. fitted with magneto ignition. The change speed-gear, which gives three forward speeds and a reverse, is of the Soames type, the transmission being by side chains. The vehicle is fitted with a special form of artillery type road wheel introduced by the firm. The wheel is a twin spoke one, a feature being a fixed centre flange which divides the lateral strain equally, so that each side takes up its share. The hub is composed of a boss with a fixed centre flange and two loose flanges, the spokes being divided into two sets on the hub by the centre flange, but all run into the same centre line in the felloes. The fixed centre flange is bevelled on either side, but the two loose flanges have parallel faces. The bases and the bottom end of each of the spokes are cut at angles which permit the bolts

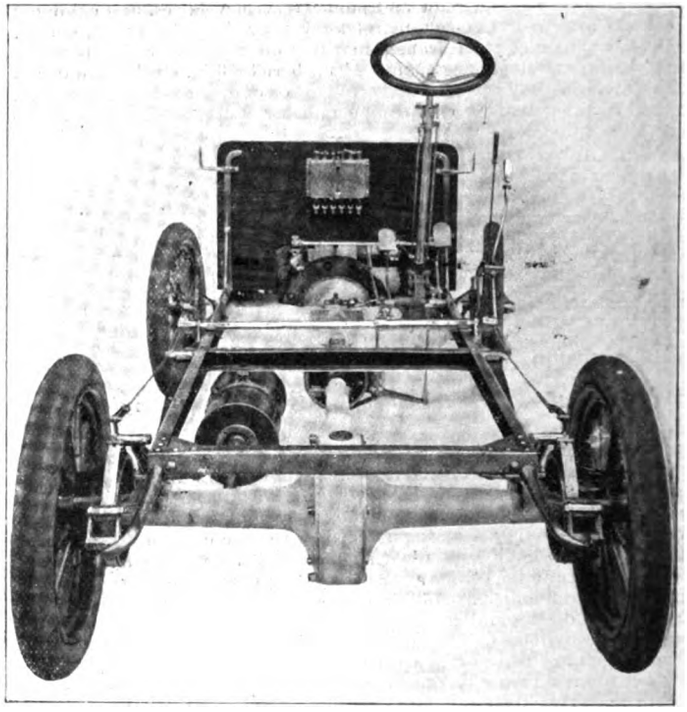

Fig. 31.—Rear View of Siddeley 6-h.p. Vertical Engine Car.

to draw the flanges and spokes close together, making the whole as if it were one solid piece. In this way, also, the grain of the spokes is allowed to run straight, although the spokes are lying at an angle from an horizontal base. The main advantages claimed for the wheel are that it takes up side strain much better and is not so liable to collapse with a twist or a blow.

The IVANHOE MOTOR COMPANY made its *debut* with a couple of excellently-finished "Mercury" cars. In general arrangement the usual lines of chain-driven vehicles are followed, the chain drives being, however, very short. The engine comprises four cylinders, 110 mm. diameter by 130 mm. stroke, having mechanically-operated inlet valves on the opposite side to the exhaust. The carburettor is of the automatic air regulation type, a feature being that no springs are used in its construction. The engine is not supported by projections from the crank case but rests directly on an underframe. We note also that the quadrant on which the control levers are mounted does not rotate with the steering wheel but maintains a constant position. The cars exhibited included a side-entrance double phaeton and a double landaulet, the finish of which reflected much credit on the new firm.

A good display of carriage work was made by Messrs. J. A. LAWTON AND COMPANY, whose touring bodies are characterised by adaptability for long journeys. Plenty of room is allowed for riders, and the workmanship as well as the design are notable.

Digitized by Google

The exhibit of Messrs. S. F. Edge, Limited, consisted of four complete Napier cars and two *chassis*, each a fine specimen of its particular type. Broadly speaking there were four distinct models on view: Four-cylinder 40-h.p., six-cylinder 30-h.p., four-cylinder 24-h.p., and four-cylinder 18-h.p. The Napier synchronised ignition, and the hydraulic air regulator are prominent features of these cars; while a new metal-to-metal clutch, which enables the car to be started on top speed if desired, was seen for the first time. Two views of the clutch are given in Fig. 32. The special points may be summarised under four headings, as follows: 1. Designed so that it is possible to run in oil. 2. All end thrust on engine obviated. 3. Simplicity and compactness of design. 4. Very light revolving parts, making change of speed easy. The clutch itself is of the internal cone type. The internal member, A, which is of aluminium, has a cast-iron facing, B, riveted to it, forming one friction surface. It is dished considerably, so as to accommodate the clutch spring, K, which presses against it, at one end, and against a flange, J, at the other end, a ball-thrust bearing, F, being interposed between the spring and the flange. The latter is bolted to the fly-wheel of the engine, so that the shaft upon which the inner member, A, is freely mounted practically

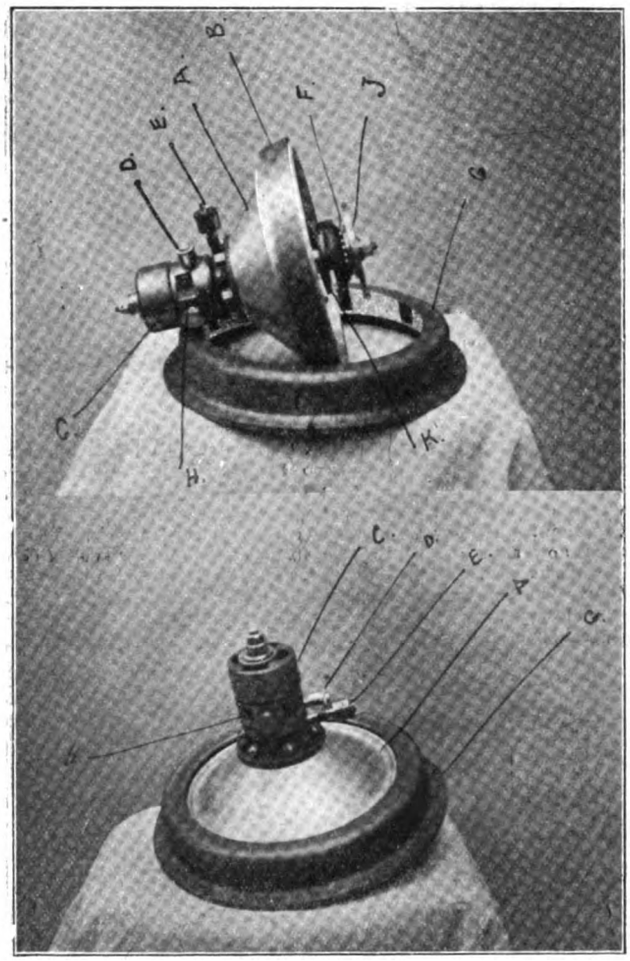

Fig. 32.—The Napier Metal-to-Metal Clutch.

forms part of the crank-shaft, so ensuring proper alignment of the parts. Bolted to the fly-wheel is the cast-iron ring, which forms the outer member of the clutch, encircling the internal member, A. The pressure of the spring, K, acts between them, and forces out the member, A, so causing the two friction surfaces of the clutch to come into contact. In order to ensure the proper lubrication of the surfaces, grooves are cut at intervals across the inner surface of the outer member; the oil remains in these grooves while the clutch is engaged, in readiness to lubricate the surfaces directly the clutch is allowed to slip. To disengage the clutch, a fork, not shown in the illustrations, is connected with the boss H, which is thrust forward by the pedal, causing the member, A, to move inwards against the action of the spring. A universal joint is enclosed in the box, C, this ensuring flexibility between the clutch-shaft and the gear-shaft. By means of the new clutch it is possible for the car to start away from a standstill without a jerk and to glide into motion smoothly, the reason being that the oil on the surfaces of the cones B and G allows a certain amount of slip to take place until the full power is required to be transmitted, and immediately this takes place the oil from off the surfaces is forced, by the pressure of the spring, into the grooves in the outer member. Having dealt with the clutch, we may refer to the new type of car which has been introduced, viz., the 40-h.p. chainless car, in which the power is transmitted to a live axle by a cardan shaft and bevel gear, as has hitherto been done in the Napier racers. Passing now to the actual cars exhibited, we may first mention a 30-h.p. six-cylinder touring carriage fitted with a side-entrance body and canopy. The latter is, perhaps, worth special notice, as it is arranged so that the rear portion of the body can be completely enclosed so as to form a covered-in car. A 24-h.p. limousine (Fig. 34) was also shown, the body of which is by Mulliner, and

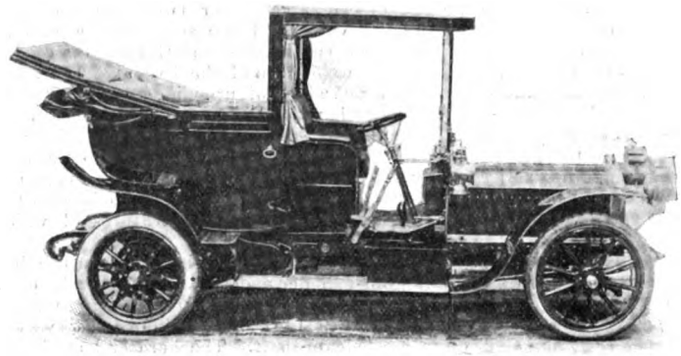

Fig. 33.—A Napier 30-h.p. Six-Cylinder Landaulet, built for Countess de Grey.

is a distinct departure from the lines of the usual covered-in car. Accommodation is provided for six passengers and the driver, the interior of the car being arranged so that all the passengers face forward. A noteworthy point is that the roof throughout its entire length has a "clerestory," which not only considerably enhances the appearance of the car, but is so arranged as to admit light and ventilation. A new 18-h.p. Popular Napier was also on view for the first time; it is a four-cylinder car with roomy four-seated side-entrance body. The engine has its cylinders arranged in pairs, and is fitted with single coil synchronised ignition. The inlet valves are mechanically operated, and the carburettor is fitted with the hydraulic air regulator. The frame is of wood armoured with steel flitch plates. The transmission gear gives four changes of speed and a reverse, all actuated by one lever. Altogether the 1905 Napier cars appear fully destined to maintain their high reputation.

The Metropolitan Engineering and General Motor Car Company, Limited, displayed a neat little two-seated car with hood and front glass, designed for the use of doctors. The engine is a 6½-h.p. Aster single-cylinder, the transmission being by a cardan shaft and bevel gear to a live axle. At this stand were also to be seen a couple of strongly-built light delivery vans. The larger one was fitted with a 12-h.p. two-cylinder engine, the transmission being by side chains. The frame is of channel steel, while the van body is intended for loads up to 12 cwt. The other van was a small one to carry 6 cwts.; it is fitted with 6½-h.p. motor and live axle.

Messrs. Cottereau and Company, represented in England by Messrs. McNeil, Hutchison and Company, had an extensive display of cars fitted with one, two, three and four cylinder engines, each of which comprise a number of new features. The 8-h.p. single-cylinder car has a tubular

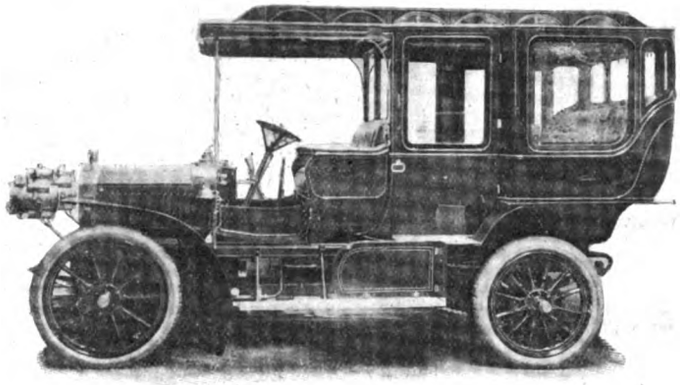

Fig. 34.—The Napier Limousine with Clerestory Roof.

frame. Three speeds and reverse are provided, transmission being by a single chain to the rear live axle. The motor has mechanical valves, and is governed on the inlet. An 8-h.p. double-cylinder car was also shown, this having side chain transmission. Much interest was displayed in the 18-h.p. three-cylinder car, which has a gear-box running on ball-bearings, pressed steel frame, and rear internal metal brakes. The 24-h.p. four-cylinder car was also well worthy of close examination. The Cottereau engines have separately cast cylinders with mechanically-operated valves,

Digitized by Google

arranged on opposite sides. The speed of the motor is regulated by means of a variable lift device on the inlet valves. With the exception of the small car, the frames are of pressed steel construction. A display of radiators made by the Lune Valley Motor Carriage Company, Lancaster, was also to be seen at this stand.

The Croxted cars, which are being made in four sizes—6-h.p. single-cylinder, 10-h.p. double-cylinder, and 14-h.p. and 20-h.p. four-cylinder—were shown by the CROXTED MOTOR AND ENGINEERING WORKS. The 6-h.p. car is a two-seater on the usual lines, the motor being a De Dion. The 10-h.p. vehicle, which is supplied either with a tonneau body or as a two-seater, is fitted with one of the latest Aster two-cylinder engines having mechanically-operated inlet valves. Three speeds and a reverse are provided, the drive on the top speed being direct through the cardan shaft to the live axle. The 14-h.p. car is also of the live axle type, the motive power in this case being furnished by a four-cylinder engine, 90 mm. bore by 110 mm. stroke. A very handsome car was to be seen in a 20-h.p. side-entrance double phaeton with Mutel four-cylinder engine and side chain transmission. Without comprising any startling departure from standard practice it may safely be stated that the Croxted cars are excellent specimens of their class. At this stand was also to be seen the "Armoured," a tyre introduced by Mr. MEADOWS, the features of which were recently described in our columns.

The ENFIELD AUTOCAR COMPANY exhibited at the show, for the first time, examples of their 20-h.p. four-cylinder and 10-h.p. two-cylinder cars. A pressed steel frame is adopted, the engine being carried directly thereon. The cylinders are cast in pairs, with the inlet and exhaust valves mechanically actuated off a single cam-shaft. The bore and stroke of the cylinders of both engines are 4 in. by 5 in. A tubular radiator combined with a tank fills in the forward end of the boiler-shaped bonnet. No pump is fitted, the circulation being on the thermo-syphon system. The flywheel rim is provided with external vanes shaped to act as a fan. Ordinary high-tension ignition is provided, the commutator being on the incurved dashboard. The latter is illustrated in Fig. 36, from which it will be seen that it accommodates accumulators, coil, engine lubricators, tool cupboards, &c. The power is transmitted on the 20-h.p. car through a combined clutch and brake similar to that adopted in the Chenard-

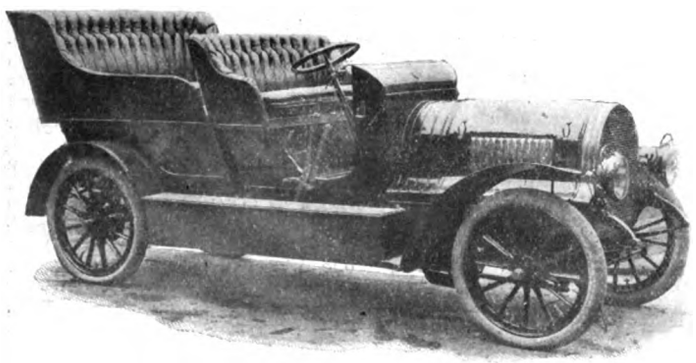

Fig. 35.—The Royal Enfield 20-h.p. Side-Entrance Double Phaeton.

Walcker car, the pedal withdrawing the clutch applying the brake when fully depressed. The gear-box gives three speeds and reverse with direct drive on top speed. The transmission is by bevel gear to a live axle. The cardan shaft on the larger car is provided with a universal joint at each end; it is formed of three spring steel rods, which twist to the extent of 50 per cent. in taking up the drive, and thus avoid all shock to the gear and bevel driven pinions. On the smaller car the spring rods are replaced by two spring blades. The back wheel brakes are of the internally expanding type, and are applied by a pull-up lever. Other features of the cars are found in the provision of an automatically engaging starting handle and special twin radius rods extending from the differential casing to a joint on a bracket behind the gear-box. The 10-h.p. car is especially interesting in that it is so made as to serve a variety of purposes; it is made in the form of a two-seated car, the rear part being, however, so designed that either a detachable tonneau or van body can be readily fitted to it. By purchasing all three, the vehicle can thus be used not only for commercial purposes but also as a pleasure car for two or four persons. The various details appear to have been well designed; and now that the Enfield Company have entered the motor world their cars should quickly become as popular as the cycles turned out from another branch of the same factory.

The stand of the DE DIETRICH Co., represented in this country by Messrs. Jarrott and Letts, Ltd., was one of the most striking in the Exhibition. The sign was of iron construction with revolving centre announcing the name of the firm. Three types of the cars were shown, viz., 16-h.p., 24-h.p. and 40-h.p., in which several striking alterations and a number of important modifications have been made. The length of the wheel base has been increased, and they are now arranged for the fitting of side entrance carriage bodies. The appearance has been considerably changed by the adoption of a honeycomb radiator. Cooling is assisted by a belt-driven fan, the fly-wheel being also of fanlike design to induce increased draught. The motor, Fig. 37, itself is of an entirely new model. The inlet valves are arranged in the cylinder heads, and are actuated off the same cam shaft as the exhaust valves. It is fitted with an improved carburettor with a very finely-graduated throttle to enable the motor to be set to run at any speed. The throttle is worked by a lever arranged on the steering wheel, a second lever controlling the ignition. An accelerator is also arranged for easy and quick acceleration in traffic driving and starting up-hill. An ingenious device whereby, when the throttle lever is opened wide, the action of drawing out the clutch

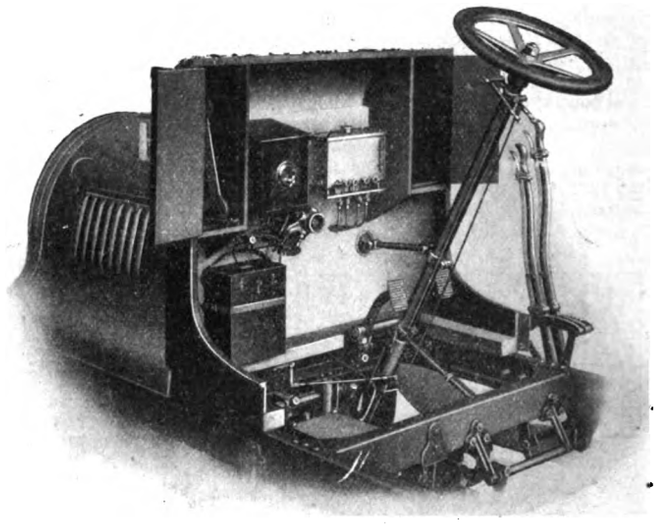

Fig. 36.—View of Dashboard of Royal Enfield 10-h.p. Car.

immediately throttles the engine, is another important improvement. On the 40-h.p. *chassis* we noticed that a half-compression lever is provided for easy starting. The change-speed gear-box is of a new pattern, and cardan joints are provided on the differential shaft to obviate any strain being transmitted to the gear-box bearings, and for the same purpose a cardan joint is arranged between the gear box and the clutch. Ball bearings are fitted to the gear-box shafts and the road wheels. The side brakes are of a much lighter design than formerly; they are internal expanding, and enclosed from dirt and mud. A compensating arrangement is fitted whereby equal tension is put upon the brakes on both the road wheels. The steering bar is now arranged behind the front axle. A new type of bonnet, with low dashboard, sloping footboard, and sharper rake of the steering wheel, give the cars a considerably smarter and more stylish appearance than the old type, and as the *chassis*, to ensure stability, is much lower, the general effect is very pleasing. The great feature of the De Dietrich

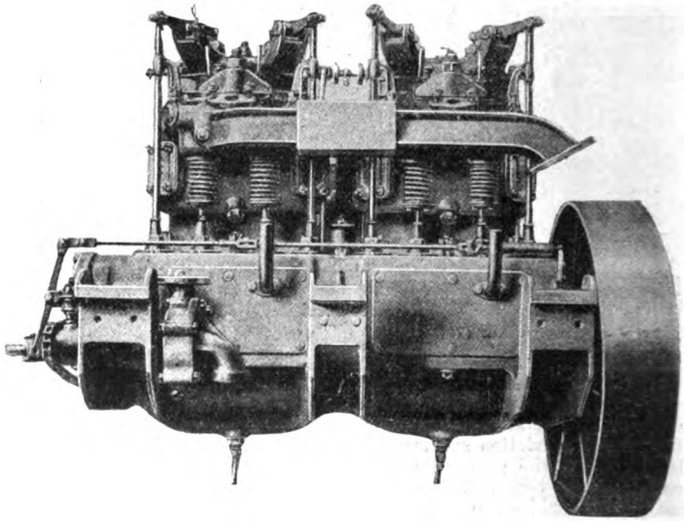

Fig. 37.—View of Exhaust Side of De Dietrich Engine.

display was a 40-h.p. touring vehicle, which embodies a saloon provided with beds, seats, writing table, electric light, electric bells, and dressing-room. It is completely equipped with every requisite, and was one of the attractions of the show.

Mr. G. GOLDSCHMIDT had his customary good display of motor-lamps, including head, side and rear lights of the Zanardini and Jupiter models, which secure a capital illuminating efficiency. The "Octopus" and "Doubletwist" horns, the "Merz" motor goggles, and various other accessories made up a display of considerable interest.

The Albion Motor Car Co., Limited, in conjunction with the Lacre Motor Car Co, Limited, showed various types of Albion cars, including touring and commercial vehicles of different types. The speciality of the company has been in the construction of cars suitable for running on solid tyres with the same comfort as on pneumatics, at speeds up to about twenty miles per hour. The vehicles exhibited included a 16-h.p. tonneau de luxe, with body constructed by Messrs. James Henderson and Co., Glasgow, fitted with 5 in. pneumatic tyres, and speeded to thirty-five miles per hour. The *chassis* of this car has a wheel base of 7 ft., and an over-all length of about 11 ft. A side-entrance car, having an 8 ft. 9 in. wheel base and Lacre body fitted with solid tyres on all four wheels, was also shown. A type of vehicle specially constructed for hotel proprietors, shooting boxes, &c., was an eleven-seated wagonette, with detachable canopy, glass screens, and storm curtains all round, while among the commercial vehicles were several types of vans and lorries The motor (Fig. 40) of all the above cars is of 16-h.p., and is of the two-cylinder vertical balanced type, the cylinders being 4⅛ in. bore by 5 in. stroke. The inlet valves are mechanically operated, and by the loosening of a single nut each pair of exhaust or suction valves may be withdrawn.

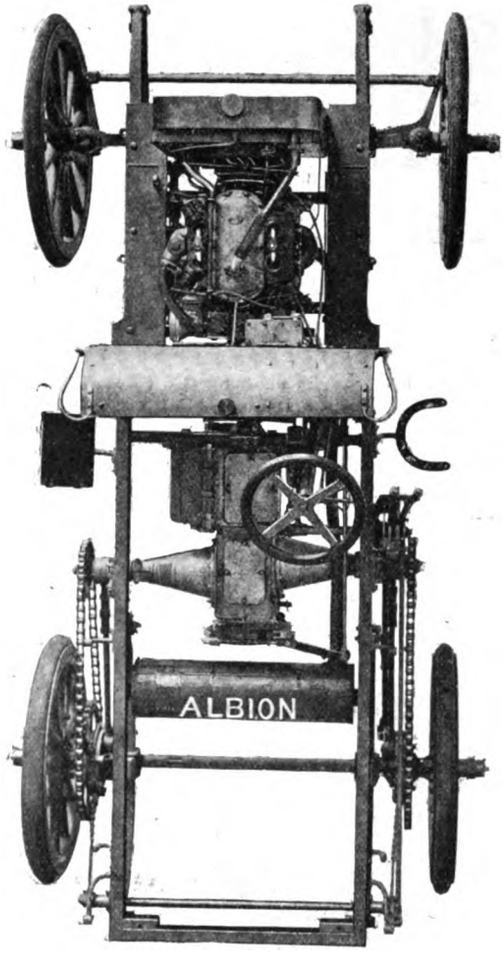

Fig. 38.—Plan View of Chassis of Albion Car.

Relief cams are provided, which make the starting of the engine a simple and easy matter. The ignition is magneto electric, the current being generated by the Albion patent magneto generator, mounted directly on the crank-shaft. The armature and coils are stationary, there being no sliding contacts, commutators, or brushes, and consequently nothing to go wrong. There is no complicated wiring, only a single conductor leading from the generator to the plugs. The ignition is timed at all speeds by the Murray patent governor to take place at the most effective point of the stroke. The ignition trip gear has been completely silenced by the introduction of a new buffer hammer. The motor is governed on the inlet by a governor, which automatically regulates the speed, mixture and ignition advance, the action of the governor itself being controlled by a single lever, which therefore simplifies the driving. The centrifugal part of the governor (Fig. 33), is so designed that the sliding sleeve A begins to move along the shaft when the engine is running at 180 revolutions per minute, and only reaches the limits of its travel when a speed of 1,000 revolutions is attained; there is therefore a definite position of this sleeve for every speed of the engine. Within these limits and by means of a hand lever B, fitted below the steering wheel, the driver can determine at will the speed at which the governor will close the throttle. The governor may, therefore, be set to hold the car at any desired speed, or, in other words, to follow up the desires of the driver. At whatever speed the governor is set the car will, it is claimed, maintain this steady speed up and down hill and on the level without any attention, provided the hill is not too steep for the engine on the particular gear of the change-speed mechanism in action. The correct instant for ignition for each speed of the engine has been carefully determined by experiment, and a simple mechanism designed,

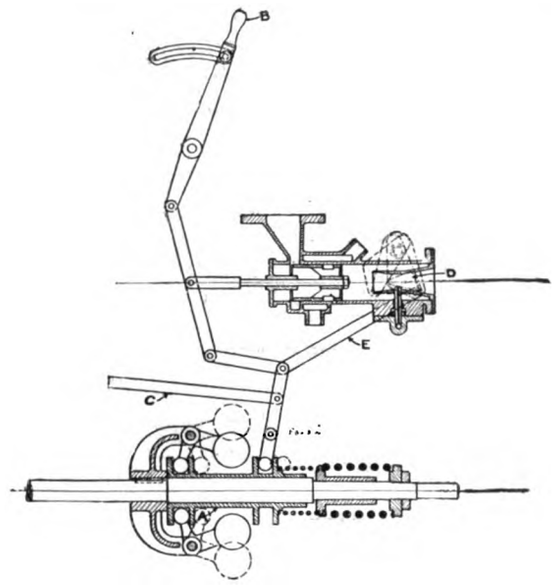

Fig. 39.—Diagram of Arrangement of Murray Patent Governor.

controlled from the governor by the connecting rod C, which automatically advances and retards the ignition. The correct mixture of gas and air at various speeds and loads has also been experimentally determined, and from the data obtained an automatic carburettor has been designed to give the best mixture under all conditions. The opening of the extra air port D is controlled for this purpose by the governor through the connecting rod E. The carburettor is provided with a hot water jacket to prevent freezing in cold weather. The power from the engine is transmitted to the gear case through a leather-faced clutch and an improved form of spring

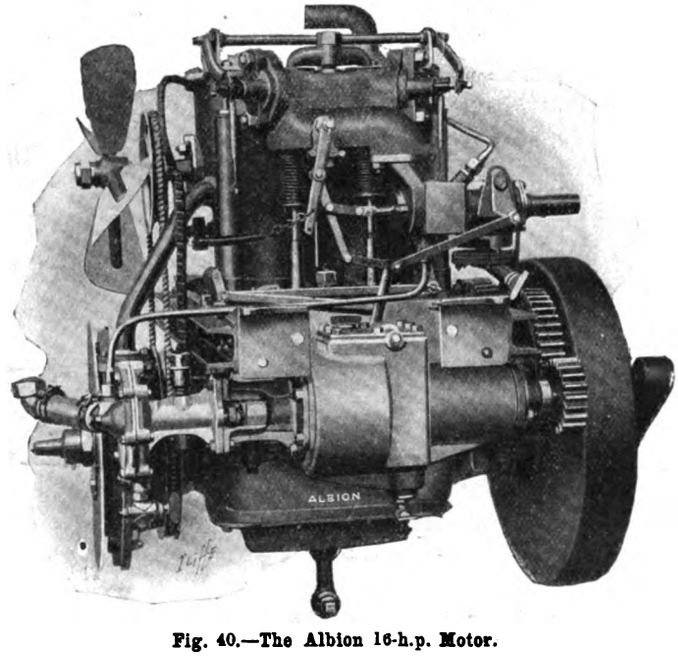

Fig. 40.—The Albion 16-h.p. Motor.

drive, whereby the torque or driving strain from the engine passes through a set of springs which absorbs any jerks or shocks due either to uneven roads or to careless manipulation of the clutch, and adds greatly to the smooth running of the car, reducing, at the same time, the wear and tear on the engine and gearing. The speed change gear provides three speeds forward and a reverse. The two higher speeds are operated by positive clutches. The wheels for these are always in mesh, the

Digitized by Google

top speed being a direct drive from the engine to the bevel gear. The low speed ahead and the reverse are obtained in the usual way by sliding the wheels sideways into gear. The changes of speed are all operated by a single lever, and the driver can change direct from one speed to any other without passing through intermediate gears. Two powerful independent double-acting brakes are provided. The foot brake consists of a metal drum, having shoes fitted with cast-iron liners, which can be renewed when worn. The band brake is similar in construction, and acts on drums fixed to the rear wheel hubs, the pressure

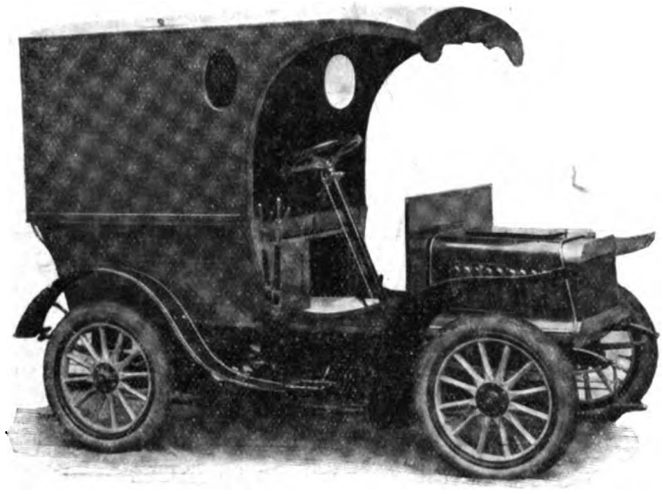

Fig. 41.—The Alldays and Onions Delivery Van.

on the two being balanced by a simple arrangement of levers. There are several other points of interest which pressure on our space prevents us referring to on the present occasion, but from the foregoing it will be seen that the Albion cars are the outcome of careful study, the result of which is seen in the reputation for reliability which they have earned, not only at home but abroad.

The Alldays and Onions Company, Limited, exhibited several of their latest 8-h.p. single-cylinder cars fitted with different types of bodies. The engine, which has mechanically-operated valves, is fitted in the fore part of a channel steel frame. The carburettor is of the spray type, having float feed and automatic air regulator. The change speed gives three forward speeds and a reverse, actuated by one lever. The transmission is by cardan shaft and bevel gear to the live axle. The cars exhibited included a two, three and four-seater, a neat coupè, controlled from the inside, for doctors' use, and a serviceable looking light delivery van, with movable top, Fig. 41. The vehicle is fitted with detachable seats for four passengers when used as a pleasure car, and is shod with pneumatic or De Nevers solid tyres.

For the 1905 season the Mors cars are being made in five different sizes, viz., 12-16-h.p., 14-19-h.p., 19-24-h.p., 25-32-h.p., and 40-52-h.p., all having four-cylinder engines and frames sufficiently long to take side-entrance bodies. Mors, Limited, the new concern which is now handling these well-known cars in this country, had a large stand on which were shown a 24-32-h.p. *chassis*, a 14-19-h.p. coupè-limousine (Fig 42), and a 14-19-h.p. landaulet with Rothschild body. All the cars have pressed steel frames; the motors have low-tension magneto ignition and a new form of automatic carburettor; the latter has two air inlets, the mixture being regulated in accordance with the requirements of the engine at different speeds. The four cylinders are cast in two pairs, and a noticeable feature lies in the fact that the vertical axis is not coincident with that of the crank shaft, the cylinders being displaced slightly to the right, towards the magneto side. The object of this is to reduce the friction between the pistons and the cylinder walls on the explosion stroke; the obliquity of

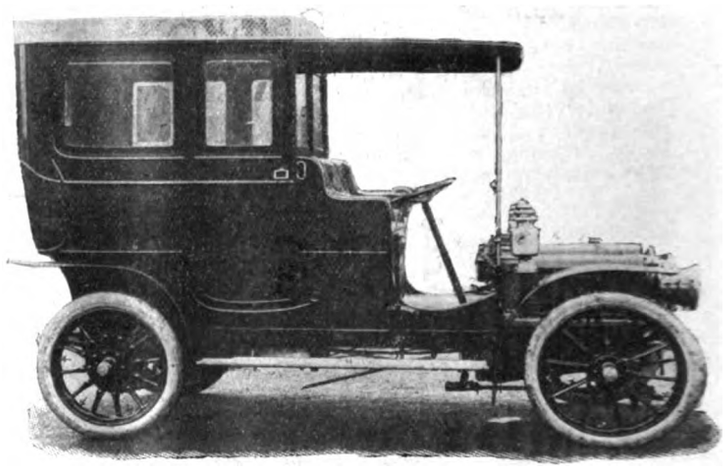

Fig. 42.—The Mors 14-19 h.p. Coupe-Limousine.

the connecting rods being less. It is also possible to use shorter connecting rods, and shorter and lighter cylinders. Another point of note is the manner in which the time of the lift of the valves and ignition stems is varied. The rod which lifts the valves is no longer placed immediately over the cam, but is pivoted at the end of a lever, in the middle of which a roller is fixed. This roller is raised by the cam, the valve spring causing it to descend again. The relative position of the lever and cam is variable, being regulated by a screw and lock nut outside the crank chamber; in other words, the roller is moved to and fro so as to receive at an earlier or later period its impulse from the cam. By this means the time of the closing of inlet and exhaust valves, and the advance of the spark, can be regulated to a nicety. The advance-spark lever is entirely dispensed with, so that the engine can be started without fear of back-fire; when once in motion the voltage of the magneto, and consequently the temperature of the spark, varies directly as the speed. No centrifugal governor is fitted, the speed of the engine being controlled by the throttle valve, which is closed as soon as the driver de-clutches. To obtain, however, absence of noise and the minimum consumption of petrol, in addition to the admission being throttled, the lift of the inlet valves is reduced by two cams joined together by an inclined plane. In one position a lift of twelve millimetres is obtained, in the second position only four millimetres. A lever placed near the steering column causes the whole of the cam shaft to slide along horizontally, and brings the different steps of the cam underneath the

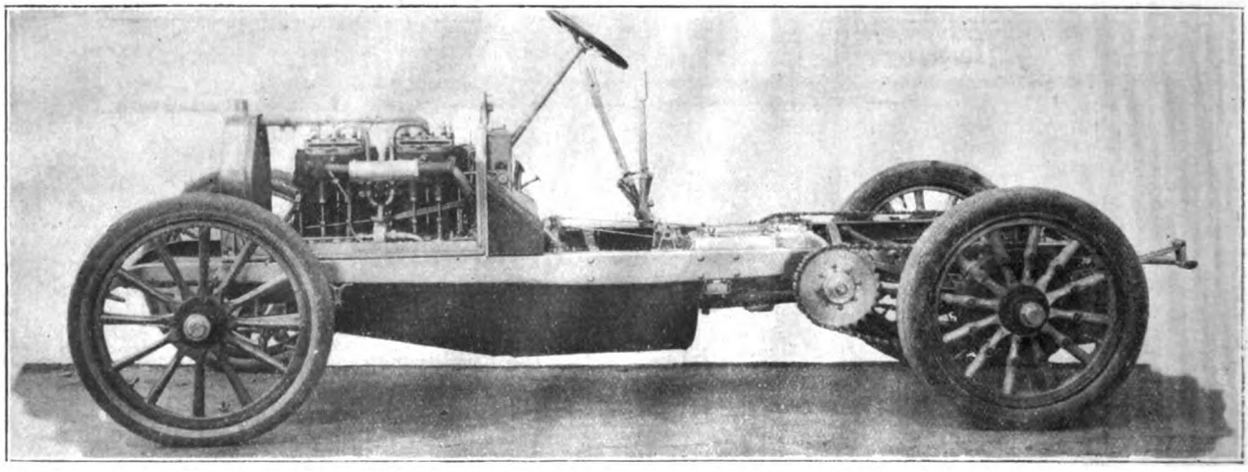

Fig. 43.—Chassis of Fiat 24-h.p. Car. (*See page 1066 last issue.*)

Digitized by Google

rollers attached to the valve-lifting mechanism. The spur wheel keyed to the crank-shaft is made twice the normal thickness, so as to drive the cam shafts in both positions. The cooling of the cylinders is effected in the usual manner by a pump which forces water, already cooled by the radiator, through the water jackets. The pump is driven direct off the inlet valve cam-shaft, and is attached by a bayonet joint. By removing one nut and giving half a turn to the body of the pump the latter is detached. No fan is fitted either in the fly-wheel or behind the radiator. The Mors Company state that they have proved by experiment that the best fan cannot produce a current of air of a velocity greater than eight miles an hour, so that when the car is travelling quickly the fan offers a back pressure to

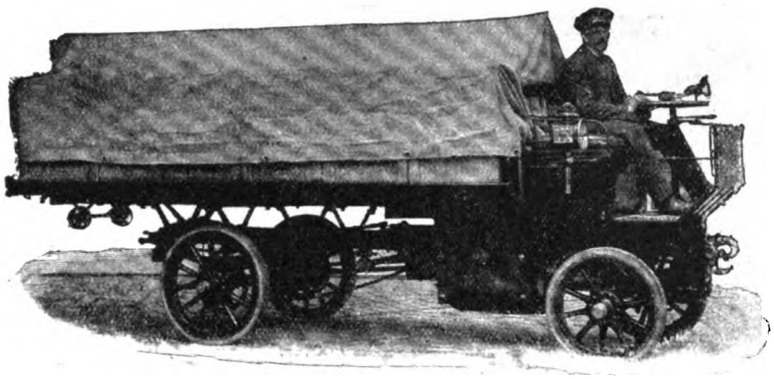

Fig. 44.—The Frick Petrol Lorry.

the natural current of air. The lubrication is effected by a small pump, analogous in construction to the water-circulating pump. An oil reservoir of a capacity of 12 litres is provided, which allows of a two-days' journey without attending to the lubrication. The pump is placed underneath the bonnet, and is actuated by the lift of the exhaust valve mechanism. It forces the oil into a set of sight-feeds on the dash-board, from which it falls by gravity. To start the engine the exhaust valves are kept slightly lifted during the compression stroke; this is effected by moving the cam shaft horizontally, and allowing differently shaped cams to raise the exhaust valves. The Mors system of change-speed gear, in which the power is transmitted through one or other of two bevel gears to the differential shaft is still retained. The clutch is extremely simple; the male portion turns freely on a prolongation of the crank shaft, and is therefore always in line. The first-motion shaft of the gear-box is coupled to the crank-shaft by two spherical cardan joints. An interesting improvement has been applied to the steering mechanism, all back-lash being automatically taken up by a moveable sector, attached to a fixed sector by a screw, and which is always pressed home against the screw-thread by a wedge under pressure of a spring. The brakes are three in number: there is an ordinary band-brake on the differential counter-shaft, operated by pedal; another pedal controls a compensated contracting brake on the two back wheels; thirdly, an internal expanding brake on the back wheels applied by a hand lever, connected up to the clutch. The frame is suspended by two rear semi-elliptical springs placed longitudinally and by a transverse back spring. Both sets are supported on ball-joints at the end of a rod about four inches in length, uniting the two and allowing full play in all directions. The care which has been used in the design of all details makes the 1905 model a perfect car. Messrs. Mors, Limited, have also taken up the agency for the Cardinet electrical vehicles made by La Compagnie Francaise de Voitures Electromobiles, and exhibited a luxuriously finished brougham. The motors in these carriages are located in the fore part of the frame, and drive the rear axle through bevel gearing. They are provided with two armatures and two fields, which allow of four speeds without changing the battery connections.

Messrs. A. Dougill and Company, Limited, of Leeds, who are now represented in London by Messrs. R. G. Batchelor and Company, of Phipp Street, Finsbury, exhibited a petrol lorry designed to carry a load of 30 cwt. (Fig. 44). The feature of the vehicle is found in the transmission system adopted. The engine is a single-cylinder one, of 9-h.p., with mechanically-operated inlet valve, low-tension magneto ignition and automatic carburettor. The usual friction clutch is replaced by a disc. At right angles to this are two friction wheels, one being fixed on the shaft, the other, while forced to rotate thereon, is free to slide on the shaft and its position in relation to the disc varied as desired. By this means any speed can be obtained, and when the sliding friction wheel is brought over the centre of the engine shaft disc, a reverse motion is obtained. The fixed friction wheel is only employed to increase the friction, and has contact both with the forward disc and one at the rear. From the friction wheel shaft to the rear live axle the power is conveyed by a single side-chain. A neat 7-h.p. van designed for loads up to 8 cwt., and provided with friction drive, was also exhibited. Many experiments have been made in the past to introduce a successful friction-driven car, and in the Frick vehicles the makers claim to have overcome the difficulties hitherto encountered.

Messrs. Michelin and Company had a good show of tyres, including some of general interest which have done duty in the classic motor-car races. A neat and effective forked lever used for taking off or putting in the security bolts and the valve was also on this stand. Near by Parsons' non-skids for motor-cars, tri-cars and motor-cycles were shown by the Parsons Non-Skid Company, Limited. Since they were shown at the Agricultural Hall Exhibition these have secured a wide recognition. The "Seddon" tyre in red rubber and Moseley's beaded edge tyre, previously dealt with in these columns, were to be seen on the stand of Messrs. David Moseley and Sons, Limited, who are devoting much attention to motor work.

Messrs. Ransomes, Sims and Jefferies, Limited, exhibited the three sizes of their motor lawn mower, viz., 42 in., 30 in., and 24 in., these being fitted with 6-h.p., 4-h.p., and 2¾-h.p. motors respectively. Transmission is by chain-gear through a reducing arrangement, and there is a separate clutch for putting the cutting cylinder out of gear when required to roll the grass only. The arrangement of the handles and levers for starting, stopping, steering, and emptying the grass box is simplified so that they can all be easily reached from the driver's seat. These lawn mowers have been supplied to many of the leading noblemen of the country and are doing good service on some of the largest estates.

On the stand of the Palmer Tyres, Ltd., was a pneumatic motor-'bus tyre manufactured from the airless cord fabric which is used in Palmer cord tyres, which have become so familiar. This is designed to carry three tons per wheel when inflated to a pressure of about 100 lbs. per square inch. The samples shown were 45 in. diameter to carry the centre of axle 22 in. from the road. The tread is equal to that of an ordinary pneumatic tyre, 10 in. in cross-section. This motor-'bus tyre is constructed in such a way that it more or less encloses the felloe of the wheel, so that in the unlikely event of the very thick rubber tread being punctured, there would be no risk of the 'bus overturning, because the felloe of the wheel is so near the ground. If necessary, the pneumatic tyre could be taken off and the 'bus driven home on the iron rim of the felloe. The samples shown were made plain on the tread for use on the special testing apparatus in the Palmer tyre experimental department. When made for the road the tread will be of the registered design as used for Palmer cord motor-tyres, but of course greatly enlarged; in fact, the three ribs will be equivalent to three small tyres side by side. It is anticipated that there will be no tendency to side-slip, this design having proved so remarkably successful in the case of the Palmer cord motor-car tyres. The company's ordinary tyres are still well to the fore, and in the speed trials held in Florida, Mr. A. Macdonald won the Thomas Trophy, made a world's record for the distance of ten miles, and was successful in winning the Miller Trophy for the twenty mile race. His car was fitted with Palmer cord motor-tyres of the ordinary touring class. The Palmer Tyres, Limited, also exhibited a new cord motor-tyre of a light make for racing purposes, which will show an improvement upon the ordinary motor tyre

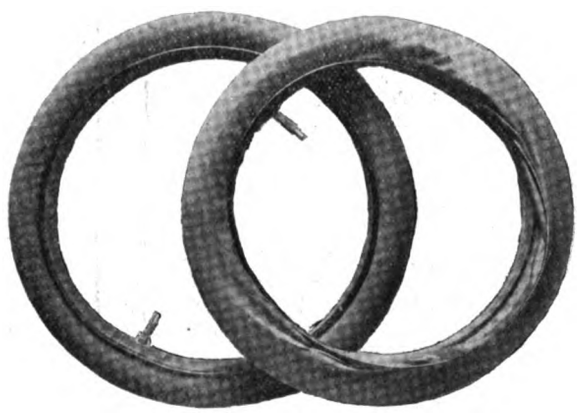

Fig. 45.—The Palmer Spare Tyre Case.

for speed. We illustrate the spare tyre-case recently introduced by this company; it is specially intended for carrying a spare cover and tube on the car. There are no projecting parts to catch the dust, and it is easily cleaned, while for preserving the tyre from risk of damage by weather, etc., it is excellent.

On the stand of the Self-Sealing Air Chamber Company, Limited, Birmingham, was found the "Hermetic" motor tyre and the Hermetic patent detachable joint for ordinary air tubes. This latter provides a means of easily connecting or disconnecting a continuous air chamber and will save much time in repairs. A display of gaiters was also included in the exhibition. The company are continuing their motor repair department, but are giving increased attention to the manufacture of new tyres.

The North British Rubber Company, Limited, had a good show of the Bartlett-Clincher motor tyres for cars and voiturettes. These have done so well in many competitions, and their characteristic features are so well known that detailed description seems superfluous.

MAGNETIC CLUTCHES.

To the Editor of *The Motor-Car Journal.*

Sir,—I noticed that in the discussion on the recent paper at the A.C.G.B.I. by Mr. Cozens-Hardy on the Paris *Salon* reference was made to the use of magnetic clutches on motor-cars. At one time it seemed that the magnetic clutch might be destined to fill a want for a means of transmitting the constantly increasing driving torque of cars, it being evident that, as the power of cars became greater and greater, the leather-faced clutch would eventually be inadequate for the purpose. Reports have been spread repeatedly that some one of the more prominent Continental makers had adopted this device on their latest cars, but when the cars finally appeared the reports always proved to have been false. In fact, the only serious attempts to develop the system have been made by individual advocates, and they have gradually faded away, as is evidenced by the fact that only a single car with magnetic clutches was seen at the Paris Show. I believe that in a number of cases the reason for abandoning the device has been its failure to perform its negative rather than its positive functions. In other words, it was found that while there was no particular difficulty in starting the car without shock, and in effecting a positive drive, the release of the driven member was not always reliable, there being a decided tendency to drag when a quick disengagement was desired. This may have been due more to faulty design than to inherent weakness of the device. Apart from this there are still sufficient reasons why the magnetic clutch has not met with a wider adoption in automobile design. In the first place, the magnetic clutch, unlike the ordinary friction clutch, constantly consumes a small amount of power when in action. It requires a source of electrical energy for energizing its coil, and this energy is consumed while the clutch is in operation. Its use means added complication and weight, and entails the installation of electrical connections of a more or less delicate character which may be expected to be productive of occasional trouble. Then, too, as Col. Holden pointed out, while magnetic clutches are very efficient when run dry, there is a considerable loss of power when they work in proximity to oil. The present indications are, therefore, that the magnetic clutch has been passed by in the progress of automobile development.—Yours truly,

Petroleo.

GOVERNOR TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—In answer to Mr. W. Wright in the last issue of the *Journal*, it appears from his letter that the cause of the trouble is owing to not having sufficiently sensitive movement for the altering throttle. The latter generally needs such a little movement to become effective, and unless it is possible to give the necessary movement, without going beyond it, would make the difference complained of. With regard to the noise, this is no doubt due to an inefficient silencer. Any engine will run silent if throttled down, owing to the explosion being weaker. To overcome the throttling difficulty, I would advise a more flexible spring on the governors, together with a more minute adjustment on the control. The noise can without doubt be overcome by fitting a more efficient silencer.—Yours truly,

F. J. T.

LIGHT CAR EXPERIENCES.

To the Editor of *The Motor-Car Journal.*

Sir,—I should be glad if those of your many readers who use a 6 or 7-h.p. gear-driven light car will give their experiences. I have some idea of going in for a light car, but am very undecided as to whether it shall be gear or chain drive. In their reply perhaps your correspondents will give particulars on the following points:—(1) Cost of running; (2) hill-climbing capacity; (3) does the gear drive wear the tyres out quicker than chain drive? and (4) is it as good on hills as the chain drive?

I am rather inclined towards the gear drive for cleanliness and ease of running, but, on the other hand, I am informed that the chains are much more efficient on hills.—Yours truly,

Gear Drive.

CLEAN HANDS.

To the Editor of *The Motor-Car Journal.*

Sir,—Your correspondent "Sticktite" gives yet another remedy for cleaning the hands, and as the matter is one which is all-important to most of us, I venture to offer the information that a new and entirely effective substance is about to be put on the market for the purpose of cleaning hands. "Sticktite" and others will find that after a day's overhauling, or after wrestling for an hour or as much longer as is necessary with a broken chain, clean and delightfully soft and fragrant hands can be obtained within a few moments. The invention, which is a patent, and the discovery of a chemist, is non-poisonous and harmless to the skin, containing neither acids nor alkalies. Moreover, it will be sold in small and strong tins, which a motor-cyclist can carry with him, while an owner of a car can place it in any odd corner, and thereby feel assured that in case of a breakdown he can still sit down to dinner with respectable hands.—Yours truly,

Motist.

To the Editor of *The Motor-Car Journal.*

Sir,—I have noticed "Sticktite's" letter in the *Journal* of the 11th inst., and would like to recommend him a preparation that I am using with the greatest success. It is called "Pipo," and instantly removes grease, etc., of the dirtiest kind from the hands.—Yours truly,

F. W. Clelland.

THE AUTOMOBILE AND CYCLE ENGINEERS' INSTITUTE.

To the Editor of *The Motor-Car Journal.*

Sir,—It may be of interest to your readers to learn that the last meeting of the Institute, which took the form of a number of short papers, followed by discussions, interspersed with a programme of music, was so successful that the Council purpose from time to time holding similar meetings.

The last meeting included papers on four-cylinder motor-bicycles, electroplating, and carburettors, which were very ably dealt with by Messrs. Binks, Bayley and Walford respectively, and, on behalf of the Council, I should be pleased to receive letters from any of your readers who have any subject of technical interest which they would like to lay before the Institute, or which they would like to be a subject for discussion by the Institute.—Yours truly,

Charles H. McPherson.
Secretary of the Automobile and Cycle Engineers' Institute.

THE NEW LANCHESTER CAR.

To the Editor of *The Motor-Car Journal.*

Sir,—Referring to the new Lanchester, a 20-h.p. car with vertical four-cylinder engine located between the front passengers, it would be interesting to know if these innovations in an apparently well-proved design are the result of loss of faith in the old type, or if they are in response to popular demand for a vertical engine, or possibly a desire to make the *chassis* suitable for a side entrance body, seeing that the Lanchester Company have in the past insisted strongly on the special advantages of their horizontal two-cylinder engine with its unique valve gear and balancing arrangements, &c.—Yours truly,

Enquirer.

KNOCKING IN THE ENGINE.

To the Editor of *The Motor-Car Journal.*

Sir,—Can you tell me the cause of knocking in the engine of my car, an Arrol-Johnston? It will run some days and only give a slight knock, and other days will knock badly. It cannot be the connecting rods, as I have just stripped and set the brasses, and the trouble is still as bad. Can it be the water or the ignition, which is pump and magneto respectively? When I slow down on, say, third speed, and then go on again, it knocks badly; I notice, too, that it gets worse as the engine gets hot. Can you or any reader of the *Journal* suggest the cause?—Yours truly,

Regular Reader.

[The knocking in the engine may in all probability be due to premature firing caused by the motor being foul, the carbon deposit becoming incandescent and firing the charge before the piston has passed the dead centre. It would also be advisable to see that the water circulation is in order, as if the engine overheated the effect would be the same. A knock is also occasioned sometimes by the piston rings fitting loosely in the grooves, this frequently giving a deal of trouble to locate. From the indications given, however, we are inclined to think the knocking is due to premature firing.]

TYRE AND NON-SKID BAND TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—In all fairness to the interests of motorists and motoring, it is well to look at both sides of a question. Now, "A Seeker for Good Tyres," in his letter in the *Journal* of the 11th inst., would rather stumble would-be motorists, for I think the question of the up-keep of the tyres is the beginner's bogey. My experience with motor tyres has been less troublesome and expensive (which I do not think should be all attributed to luck) than that of your correspondent. I, too, have been a motorist for exactly twelve months, and not being of the class who can afford to keep a vehicle solely for pleasure, have used my car, which is a 7-h.p. two-cylinder M.M.C., for business purposes, carrying about 3 cwt. of luggage, and man, in all weathers and over roads which are not of the best. My car was fitted with Continental tyres when I purchased it from the makers, and has run already 4,588 miles without a puncture. I have to say that as soon as I observed the canvas through the treads, I had the outer covers retreaded with rubber bands. One tyre ran 2,443 miles, another 2,589 miles, the third 2,733 miles, while the fourth is still in good condition. This I think is very satisfactory, and I can only hope that "Seeker for Good Tyres" will meet

Digitized by Google

with the same success ere long. I might add that at first I feared punctures, and enquired for the best non-skid unpuncturable bands, but I was informed of their behaviour in exactly the same words as your correspondent.—Yours truly,

A Possessor of Good Tyres.

MOTOR TUITION.

To the Editor of *The Motor-Car Journal*.

Sir,—With reference to Mr. V. W. Farmer's letter in your issue of February 18th, where he says a coachman is more likely to become a good chauffeur than a man that has spent most of his time in a workshop. May I say this is wrong, as a firm of motor manufacturers are careful in recommending drivers for their own credit's sake. My attention was called a few days ago by a gentleman who has a driver. He has to attend to house work, gardening, and make himself useful; and when I examined his car, I was surprised to find that one cylinder had no compression. The gentleman said he could not understand it, as it had been running in this way for a week. I found out the cause, which was only trifling, viz, the exhaust valve stem would not allow the valve to close, which I adjusted in a few minutes. The gentleman said his driver had a certificate and ought to know, as he had a month's training, and that he was giving him £1 per week. Of course there are exceptions, but I believe every word of Mr. Sydney R. Harbert's letter of February 4th, and I contend a good man at £2 to £2 10s. per week is much cheaper then a man at £1, taking everything into consideration, viz., repairs, petrol, oil, &c. Again I say, an inexperienced man cannot take the position of a trained motor mechanic.—Yours truly,

A. B.

AN INTERESTING MOTOR QUERY.

To the Editor of *The Motor-Car Journal*.

Sir,—In my letter of the 7th ult. I mentioned that the increase of power was due to the presence of additional "atmospheric gases," and to oxygen in particular. "Farago" appears to treat the matter as a joke. It is a fact that more power can be got out of a motor in the evening after a fine or a summer's day. By this I mean to say that more power can be got out of a gallon of petrol.

The fact that the number plates are not as much in evidence after dusk does not affect the running of the motor, unless it is mechanically accelerated.

"Farago" does not appear to agree that the "atmospheric gases" have anything to do with the running of the motor. In the first place, we must mix a certain quantity of these atmospheric gases with the petrol in the carburettor before we can even obtain an explosive mixture. And the variation of the air, whether it is damp, or contains more water-vapour in it, or whether it is a dry and "brisk" air, depends to a great extent on the running of the motor, and of course on the amount of power given off by the engine. As to my statement about the "atmospheric gases" given off by plants after sunset, a good chemistry primer will soon explain this.—Yours truly,

BU-7.

NON-SKIDS.

To the Editor of *The Motor-Car Journal*.

Sir,—Reading the letter of Mr. Harry Lupton in last week's *Journal* *re* non-skid tyres which proved so unsatisfactory, I should like to give my experience, and to warn readers as to the dangers of buying through the post what are supposed to be bargains. Seeing a few advertisements at an address in London, and being in urgent need of a tyre, I journeyed from Kent with the intention of seeing the tyres and buying if satisfactory. After spending half a day the address given turned out to be a small shop to which letters may be addressed. I also went to another address not very far away and had practically the same experience, and in my opinion readers will do better to buy from recognised makers and so save money, time, and trouble in the long run.—Yours truly,

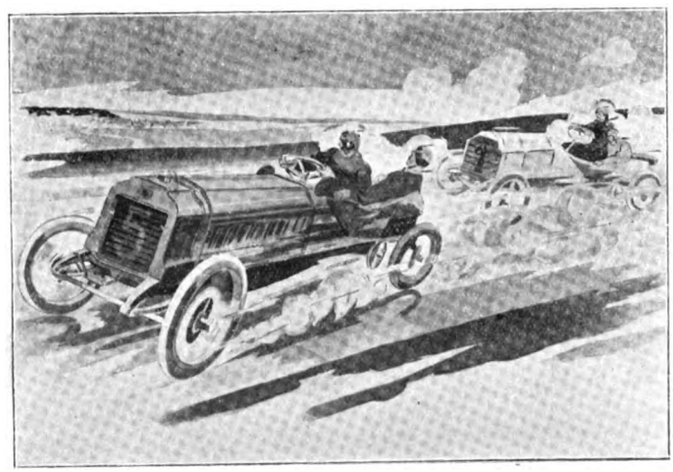
William Rosindell.

To the Editor of *The Motor-Car Journal*.

Sir,—Like Mr. Harry Lupton, I recently bought a pair of 810 by 90 mm. "newly retreaded, never used since" tyres. These were sent on approval and looked nice; naturally I did not try them before sending cheque in payment. A few weeks later I had occasion to use them; they were put on the front wheels and inflated up to 65 lbs. pressure; one ripped up after standing a quarter of an hour, the other following a little later, neither having run a yard. Needless to say I sent back both covers and demanded the return of my cheque. As no notice was taken of my letters, I have placed the matter in the hands of my solicitor. I shall be pleased to give the name and address of the vendor to interested parties.—Yours truly,

O. H. Bayldon.

We have received a number of other letters all bearing on the same point. *Verb. sap.*—Ed. *M.-C.J.*]



SIGNPOSTS AND NAMES.

To the Editor of *The Motor-Car Journal*.

Sir,—The signpost system of the country needs revision. I have lost myself three times during the last few days, between Whitchurch and Nantwich, York and Doncaster, and between Edinburgh and Perth, all for want of a sensible system of signposts, instead of the present anachronisms. The traveller will arrive at a turning, down which a sign asserts he will discover the town he desires to arrive at. He will follow this direction and will presently arrive at a circus where five roads meet, with a signpost there, sure enough. On it there will be five arms pointing respectively down each road, and not one of them with the name of the town itself, but of some intervening village. The remedy here is obvious.

Another important scheme of improvement should also be immediately dealt with by the respective authorities. Even during the day it is hard enough to discover one's whereabouts, on arriving at a town or village, especially when travelling in Scotland, Wales, Ireland and the North of England, owing to the dialect and to one's own English being misunderstood, and this is especially annoying and inconvenient as the authorities have depended for the traveller's guidance too much upon local information. At two o'clock in the morning, however, there is no local information, except that which can be obtained by knocking a man up; this procedure, moreover, is often attended with unpleasant consequences, generally cold water or something worse. At midnight one may arrive at a village, absolutely unable to determine where one is, and consequently unable to locate his position on the map and discover his future course.

What should be immediately installed in every village, town and city is a name board with the name of the locality written in big black letters

The above sketch is reproduced from a coloured plate forming part of the new catalogue of Richard-Brasier cars issued by Messrs. Mann and Overtons. It depicts Thery at full speed in the 1904 Gordon Bennett Race on the famous No. 5.

on a white ground, and the board should be erected near a lamp-post, so that, day or night, it might be conspicuous. At the entrance, too, of each town the name of the town should be written on the first two or three lamp-posts on its outskirts.

It has been brought to my notice that this matter has been broached before. I am all the more astonished that it has not been dealt with more effectively before. After all, besides the revision of the signpost system, I only ask that each village, town and city should have at least the self-respect of a railway station.—Yours truly,

Archibald Ford.

PRIMARY BATTERIES FOR CHARGING ACCUMULATORS.

To the Editor of *The Motor-Car Journal*.

Sir,—In confirming Mr. Ernest Escourt's opinion *re* Boron batteries for accumulator charging, I would state that I have used many so-called magneto devices; they are only toys compared with a good electrical ignition. Whilst there is such an admirable primary cell to be obtained, there should be no fear of charging accumulators. I am a very old admirer of these cells, as they have done me good service on many occasions, and fully come up to all the claims made for them. Mr. Escourt is perfectly correct in advising owners of petrol cars to obtain a set of these batteries.—Yours truly,

J. Branson.

Box Spanners.—A correspondent points out the spanners described by "R. C" in the *Journal* of the 4th inst. are known as L'Auto Cle.

STEEL AS APPLIED TO MOTOR-CAR CONSTRUCTION.

By J. S. Critchley, M.I.Mech.E.

(*Concluded from page* 1069.)

The following table gives about the usual commercial specifications for steel suitable for forgings no diameter of which exceeds 3 in. :—

Forging Steels Oil Tempered.

	Carbon steel oil tempered.	Nickel steel oil tempered.
Tensile strength, tons per square inch ..	40	42
Elastic limit, tons per square inch ..	24	29
Elongation in 2 in., per cent.	20	21
Contraction of area, per cent.	45	50

The phosphorus and sulphur must not exceed ·04 per cent., and the nickel 3·75 per cent. A specimen 1 in. by ½ in. must bend cold 180 deg. without fracture around a diameter of 1 in. for carbon steel and ½ in. for nickel steel. For high-class motor car work much higher physical tests are often demanded, which are obtained by so-called special nickel steels and nickel chrome steels. The last named are made which show enormous tensile strength and a very high percentage of elastic limit. A comparison between a high carbon steel, oil tempered, and a nickel chrome steel is given below.

Tests of High Carbon and Nickel Chrome Steel.

	Carbon steel oil tempered, ·947 carbon.		Nickel chrome oil tempered.	
Tensile strength, tons per square inch.	102·5	Ratio 65·5 %	102	Ratio 96·07 %
Elastic limit, tons per square inch.	66·73		98	
Elongation in 2 in., per cent.	7		6	
Contraction of area, per cent.	16·9		40	

Both these steels show the same maximum strength, but the other qualities are all in favour of the nickel chrome, especially the ratio of elastic limit to the tensile strength, which always shows high in nickel chrome steel. However, the employment of either of these steels would be attended with considerable risk, as the elongation that may be looked for is in both cases very low. They would be very liable to snap under sudden impact.

Two safe examples of nickel chrome steel are given in appended table which would be very suitable material for crank shafts, driving shafts, or axles. Both these steels are tempered and annealed.

Nickel Chrome Steels.

	Poldi. Nickel chrome, C.N.S.		*Shipman.* Nickel chrome, G.S.	
Tensile strength, tons per square inch.	53·34	Ratio 77·3 %	67·1	Ratio 93·5 %
Elastic limit, tons per square inch	41		62·75	
Elongation, per cent. ..	15		18	
Reduction of area, per cent.	62·9		59·5	

The G.S. quality is exceptionally good. The test was made at the Sheffield Testing Works, although the steel is imported there from abroad. In the unannealed state the G.S. steel only gives an elastic limit of 28·8 tons per square inch, against 62·7 in its annealed state, an increase of over 200 per cent. It is not advisable for the constructor to subject these steels to any heat treatment at all, but to have his forgings made by the manufacturer of the steel. The quality of the metal can be very easily ruined by anyone not fully acquainted with the special process of its manufacture. For instance, all these high-grade steels must receive a particular treatment which is the outcome of endless trials. They must be forged just at the right temperature, and what that temperature is can only be determined by experience. The G.S. steel, for instance, is a difficult steel to forge. It must be heated up to a good red heat after forging, and plunged in water. Nickel steel, with a high percentage of nickel, 25 per cent. to 30 per cent., is now being employed for valves. It is a very hard material, will not rust or scale, it is entirely free from brittleness, and will stand repeated shocks and impacts. Valves of this material can easily be bent double when cold. Until quite recently 12½ per cent. nickel was considered the limit for valves, but improvements in steel manufacture and the demand for a higher quality have induced steel makers to produce a 30 per cent. nickel steel.

The valuable properties of an alloy of vanadium and steel have long been recognised, as it is perhaps the most powerful of any alloy yet known. Even so low a fraction as one or two-tenths per cent. will raise the elastic limit of low carbon steels by 50 per cent. Recent developments which have been carried out by Mr. Kent Smith, the inventor of a new process for producing vanadium steel, at the works of Messrs. Willans and Robinson, Queensferry, have produced some excellent results, and the steel would appear to have exceptionally good qualities. The percentage of elastic limit to ultimate stress is generally high, and the ductibility as shown by the percentage of elongation is superior to any steel of equal tensile strength. The impact and bending tests of this steel are excellent—in fact, they are superior to a 30-ton mild forging steel of good quality. This steel will weld, and is certainly not so delicate as regards heat treatment as are many high-grade steels. The comparison of this steel with Swedish quality mild tube steel, forging quality mild steel and nickel steel is set out in the following table:

Chemical Analysis.

	Vanadium steel.	Swedish tube steel.	Forging steel.	Nickel steel.
Carbon	0·297	0·129	0·262	0·320
Silicon	0·059	0·009	0·047	0·052
Manganese ..	0·394	0·266	0·572	0·512
Chromium ..	1·066	—	—	—
Vanadium ..	0·169	—	—	—
Nickel	—	—	—	2·95
Sulphur	0·04	0·04	0·04	2·04
Arsenic	0·04 under	0·04 under	0 04	0·04 under
Phosphorus ..	0·04	0·04	0·07	0·04

Description.	Tensile stress, tons per square inch.	Elongation, per cent. on 2 in.	Impact, ft.-lbs. W. and R. test.	Hand right-angle bends.
Swedish quality mild tube steel.	22½	50	15	18
Mild steel forging quality	31	32	8	12
3 per cent. nickel steel forging quality.	39	34	14	12
Chrome vanadium as rolled	53	25	5	15
Chrome vanadium, annealed for ½ hour at 1472 F.	39	34	16	18
Chrome vanadium, oil quenched at 1652 F., and reheated at 1112 F.	53	22	13	10
Chrome vanadium bolt steel.	37	30	10	15
Chrome vanadium spring steel.	72½	13	4	—

In the normal state, it will be seen that this steel has superior properties to the best mild steels as regards bending and impact tests, and more than double the elastic limit. The steel in this condition has great power to resist torsion. A 6 in. length by ·75 in. diameter will twist 3·9 turns before parting. By annealing at 1472 deg. Fahr. the tensile strength is somewhat reduced, but static ductibility is increased, and the power to resist impact and alternations by stress have also increased to a large extent, being far higher than with mild forging steel, as also has the torsional strength. A bar in this state of the before mentioned dimensions takes 4·56 twists. By oil tempering and subsequent annealing the static strength of the steel is regained, and the elastic limit being increased to 81 per cent. of the maximum stress, and the static ductibility is proved by the fact that a ¾ in. round bar can be bent double. It will be seen that the steel in this condition is probably in the best state for motor-car work, as all the dynamic tests show great resistance to impact and vibration with very high elastic limit. The impact test in foot-pounds is almost equal to the best Swedish quality tube steel, whereas the power to resist alternations of stress is 60 per cent. higher. This, taken in conjunction with the fact that the elastic limit is three times greater, shows the steel to be of excellent structure. The elongation per cent. is higher than in nickel chrome steels of the same tensile strength.

Digitized by Google

The results obtained with this steel are much superior to steels of equal carbon content; in fact, the results are as good as are obtained by a steel with ·468 carbon content. A steel of this quality is shown in Table 2, and the result obtained in that case was considered to be an exceptionally good one. Vanadium steels, therefore, show excellent qualities, and it would appear must be suitable for motor-car constructors, and their use for this purpose must be looked forward to with considerable interest, especially as this quality of steel is one which is being manufactured in this country. The price of vanadium is high, and at one time it was worth more than its weight in gold. However, ferro-vanadium, containing not less than 25 per cent. to 35 per cent. vanadium, is now available. Probably the cost of vanadium steel will not be more than other steels of similar qualities, however, as a high-grade motor-car only exists by the employment of the very best materials that can be provided, the cost of the material being not such an important factor as in some other branches of engineering work.

TOURING IN IRELAND.*

By R. J. Mecredy.

You have all heard of Irish hospitality, but I hope that your personal knowledge of it is not wholly confined to your Gordon Bennett experiences. As an Irishman I feel that some explanation is due as to the reception the Sassenach visitor received on that historic occasion. Once upon a time, as the story-book puts it, there was a great English tourist who visited Ireland, named Oliver Cromwell, and he and a large party of friends traversed the length and breadth of the land. He was a practical man, was Oliver, and he cast his eye on the fat acres in Co. Kildare and the surrounding districts, and came to the conclusion that the Celts who were in occupation were not doing justice to the soil. Accordingly, he gave them notice to quit, and offered them the alternative of going to "Hell or Connaught." Most of them chose the latter. Those of you who have seen the barren mountains and bogs of the west will doubtless be surprised at their choice, but I only record an historical fact. For the lands thus vacated the Lord Protector found more industrious tenants from amongst his soldiers and from across the water. It was their descendants who took you in and did for you with such hearty goodwill on the historic occasion of the Gordon Bennett Race of 1903.

Seriously, however, I fear that it was the press of Ireland which was really responsible. In our anxiety that the unsophisticated tiller of the soil should support the project of holding the race in co. Kildare, we dwelt largely on the untold wealth which would thus be poured into the country by the millionaire motorists, and so it came about that the natives, who are easy to lead but hard to drive, jumped to the conclusion that golden sovereigns were to be picked up for the asking—that the motorists were coming over with the special object of distributing them, and, consequently, they were not shy about proffering their demands.

To the ordinary tourist who does not come as a millionaire anxious to scatter his gold broadcast, the people are hospitable, but more especially so amongst the genuine Celts, who preferred the unproductive soil and comparatively equable climate of the west and south to the unpleasant heat and slothful life of Cromwell's alternative.

I will give one or two typical examples of kindly hospitality. I had the pleasure of taking the Rev. A. B. Whatton for a few days' trip on my car, and while he was loitering outside a pleasant rose-covered cottage one afternoon, the elderly dame who owned the tiny domicile asked him if he would like a cup of tea. A few minutes later he was enjoying the cup that cheers, accompanied by hot cakes generously buttered, while the old lady entertained him with her quaint sayings. Before departing he asked her what he owed. The reply of this typical specimen of Nature's gentlewoman was as conclusive as it was courteous and tactful. "You are my guest," she said. "I invited you."

Again, on camping tour, we stopped at a labourer's cottage, struck by the jolly, genial face of an old woman who cheered us from the door and craved shelter to eat our lunch, as it threatened rain. We were received, metaphorically speaking, with open arms. The stove was soon at work, and the old woman supplemented the feast with potatoes or frying, home-made bread, and fresh butter and milk. Before departing, my wife asked what we owed. The old dame replied that she was proud to have us. My wife, however, did not take the hint, and on again proffering money was met by a dignified and emphatic refusal which left no room for argument. "My humble home," she said, "is at your disposal; there are beggars on the road, give the money to them."

From the point of view of the automobile speed merchant, Ireland is a barbarously uncivilised country, for the utmost that can be accomplished with safety and comfort is an average of twenty-five miles an hour, and very few reach this limit. For the tourist, however, who can appreciate the most beautiful scenery in Great Britain, and who is capable of enjoying a complete change of surroundings, and intercourse with a very interesting people, Ireland will afford a happy hunting ground. The road surface is good, bad and indifferent; and the tourist who sketches out a route at random is most likely to favour the bad specimens. For this reason it is all-important to have a suitable route sketched out beforehand. My services in this direction are always at the disposal of members of the club, and my experience extends to every part of the country, for I have traversed considerably more than one hundred thousand miles in Ireland on cycle and motor-car.

It is all-important so, to get proper information about hotels, for the average provincial hostelry is, as a rule, too awful for words, as the carman realised who hideously replied to the tourist's query, that whichever hotel he went to he would wish it had been the other. On the most favoured routes, however, most of the hotels are excellent, and include everything that the most captious could desire. The charges vary from 10s. 6d. to 15s. a day, and, as a rule, no charge is made for garaging the car.

I have heard better complaints made against Irish roads as being very destructive to tyres. I cannot help feeling that in most cases the drivers are at fault—at least, to judge from my own experience. At present I have two front tyres in use which have been running since April; one back tyre has been run since August and one since September, and all four in perfect order; in fact, there is hardly a cut on their surfaces. My air tubes have been in use for one year and nine months. A considerable amount of my driving has been done over loose roads, but I always make a point of avoiding the stones as much as possible, and run free over patches, and always take corners at a moderate speed, and apply the brakes gradually, except in case of sudden emergency.

* From a Paper read at the Automobile Club on the 16th inst.

CLUBS AND ASSOCIATIONS.

GLOUCESTERSHIRE.

The annual meeting of the Gloucestershire Automobile Club was held at the Queen Hotel, Cheltenham, under the presidency of Mr. Algernon H. Wyatt.

The committee presented the annual report, which recorded representations being made to the Gloucestershire County Council and to other local bodies in the county respecting unrolled metal left on the roads overnight, and to the lighting of all vehicles on the highway at night-time. The committee concluded the report with a statement in reference to the recently formed Bristol and District Automobile Club, and attention was called to its probable effect on the automobile movement in the county of Gloucester and its effect on the Gloucestershire club. The committee recommended that arrangements be concluded for the conveyance of the title, &c., with the object of forming one body, the new organization to be called the Bristol and Gloucestershire Automobile Club.

In moving the adoption of the report, the Chairman said the committee had undoubtedly recommended wisely. Some of the members of the club residing in the southern half of the county had already intimated their intention of joining the new Bristol and District A.C. Further, he felt sure that eventually the larger organisation would adversely affect the usefulness and success of the Gloucestershire Automobile Club, and it was consequently evident that it would be entirely to the interest of automobilism in the county to have one large and powerful body only. He had himself interviewed the chairman of the Bristol and District Club, who fully agreed with the committee's suggestion, and the Bristol club were prepared on their side to act on the proposal forthwith. It was then moved by Mr. George Young—"That, having regard to the fact that there has recently been established a Bristol and District Automobile Club, with a large and influential membership, including many of the automobilists in the county, it is considered advisable in the best interests of the movement, and it is hereby resolved, that the Gloucestershire Automobile Club do transfer its title, papers, etc., to the before-mentioned body, on the understanding that the joint organisation be called the Bristol and Gloucestershire Automobile Club.

Dr. H. P. Fernald seconded the motion. The hon. secretary (Mr. A. A. Dale) explained details of the scheme, and gave additional reasons why the present time was opportune for the proposed action of the club. The motion was carried unanimously.

Upon the motion of Mr. F. J. Bennett, the committee was re-elected to undertake arrangements with the Bristol club and bring to a conclusion the affairs of the G.A.C., under the terms of the foregoing resolution.

A hearty vote of thanks to the president was proposed by Mr. A. J. Sanders, who referred in warm terms of appreciation to the work which the president had done during the past year.

Mr. Bennett moved a vote of thanks to the hon. secretary, the hon. treasurer, Mr. F. M. Bostock, and to the assistant secretary, Mr. J. Baring Goodwin.

PETERBOROUGH AND COUNTY A.C.

The arrangements for the amalgamation of the Northamptonshire Automobile Club and the Peterborough and District Motor Club under the above title have been completed, and the new club has now settled the details of its future management. The Marquis of Exeter has been elected president, and among a long list of vice-presidents are Lord Lilford, the Hon. Leonard Brassey, Mr. G. C. W. Fitzwilliam, D.L., J.P., Major Wickham, Major Deacon, and Mr. Richard Winfrey, the prospective Liberal candidate for South-West Norfolk. A strong and influential committee has also been appointed. This includes the following well-known motorists:—Messrs. F. Heighton, B. C. Holmes, T. W. Percival, W. Walshaw, T. W. Southwell, J. Rowe, F. S. Southwell, J. Montgomery, F. Redhead, T. S. Rickman, W. Barrett, A. Morris, P. Mays, B. Gibson, R. S. Parriss, and A. Adams. The choice of captain has fallen on Mr. Richard Winfrey, and Mr. F. S. Southwell has been chosen for the office of vice-captain. Other

officers appointed are:—Hon. solicitor, Major Dea secretary, Mr. E. H. M. Wood; hon. treasurer, Mr. B. Holmes. T eat Northern Hotel will be the head-quarters of the new club. I s already a large membership, and the committee will spare no pai make the coming season's programme as attractive as possible. In ition to a series of club meets and runs, it is proposed to hold a speed t and hill-climbing competition early in the season.

BERKSHIRE.

THE first annual general meeting of the Berkshi Automobile Club was held at the Great Western Hotel, Reading, last Major E. R. Portal presided, and there were also present Sir Gilber Clayton East, Bart., Major T. Sandwith, the Rev. J. D. Ouvry, Lieut l. W. Waring (hon. secretary), Captain Rhodes, Dr. Norman H. Joy r. J. Hopkins Walters, Dr. G. C. B. Hawes, and Dr. A. Gordon Paters A letter was read from Lord Roberts regretting inability to attend. en he took up his residence at Ascot he hoped to give more attention to business of the club than had been possible up to the present time. the report reference was made to the fact that the club has had an u ubted effect in reducing the amount of inconsiderate driving. The poli prosecutions in the county have been 124 less for 1904 than 1903, which nds to show that the police have also been more considerate, notwit nding the largely increased number of cars in use.

In the place of three members of the committee who reti by rotation, there were elected the Rev. J. D. Ouvry, Mr. George A n, and Dr. A. Gordon Paterson. On the motion of the Chairman, second by Mr. J. F. Ochs, the report and accounts were unanimously adopted.

Thanks were tendered to Sir Gilbert Clayton East for the erest he had taken in the club as chairman, to Lieut-Colonel Waring fo s work as hon. secretary, and to Major Portal for presiding.

TYRE FITTING COMPETITION AT OLYMPIA.

THE series of tyre fitting competitions which were in progress daily during the motor show at Olympia were an attraction to visitors. The competitors had to take out the inner tube of a Continental tyre, substitute a fresh one and re-inflate, the winners being those who did the quickest time. Much interest was taken in the competition, for which there were 96 entries, £45 being awarded in fifteen prizes by the Continental Tyre Company. Record time was made by the winner, and the second easily beat the 6 min. 30 sec. record set up at the Berlin Automobile Show. The following were the awards:—

	Min.	Sec.	Value of Prize. £. s. d.
J. Young, Wolseley Co., Birmingham	5	48 2-5	.. 10 10 0
J. M. Turner, Walton-on-Thames ..	5	54	.. 7 7 0
A. Merry, Daimler Co., Coventry ..	6	41 4-5	.. 5 5 0
E. Horsey, London, S.E.	6	51 2-5	.. 4 4 0
C. Pallat, London	7	1 3-5	.. 3 3 0
H. Turner, London	7	4 4-5	.. 2 10 0
J. Taylor, Hutton and Co., London	7	10	.. 2 0 0
A. Orson, Wolseley Co., Birmingham	7	13 3-5	.. 1 10 0
A. Alsop, Rex Motor Co., Coventry	7	42 2-5	.. 1 5 0
C. W. Payne, Hutton and Co., London	7	46 1-5	.. 1 1 0
F. L. Ellingham, London	7	54 3-5	.. 1 1 0
H. Jennings, London	8	11 2-5	.. 1 1 0
G. Sawyer, Guildford	8	11 3-5	.. 1 1 0
G. Pinching, Hutton and Co., London	8	11 3-5	.. 1 1 0
A. Bond, Wolseley Co., Crayford ..	8	35	.. 1 1 0

This first competition having created so much interest, Mr. Brodtmann intends having another prize competition arranged at the Automobile Exhibition which opens in Edinburgh on the 24th inst.

CASES AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Wolverhampton	Damages for injuries	£7 and costs.
Slough	No rear light. In this case the defendant was the Right Hon. Graham Murray, Lord President of the Scottish Court of Session	10s.
Bournemouth	No rear light	16s., etc.
Aston.....	Reckless driving	£5, etc.
Leicester	Furious driving	Dismissed.
West London	Allowing the engine of a stationary motor-car to be in motion	18s., etc.
Torquay	No light	Dismissed on payment of costs.

EIGHT new members were elected to the Motor Cycling Club at the last committee meeting. In addition to the fixtures already announced it was decided to promote a members' hill climbing competition, to take place on a Saturday afternoon.

DETAILS have just come to hand of the first hill-climbing contest held by the Automobile Club of South Australia on a hill four miles long, the road being a winding one with a rough surface, the gradient varying from 1 in 6 to 1 in 10. About fifteen cars from 7-h.p. to 15-h.p. and eight motor-cycles competed. In the motor-cycle section the 3-h.p. Rover bicycle did the distance in 11 min. 32 sec., this time being best of all.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, *Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.
